EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed
March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library, by him, and has settled all accounts for injuring such books or otherwise.

Sec. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

MINING AND SCIENTIFIC PRESS

INV. 1898.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JANUARY 4, 1873.

VOLUME XXVI.
Number 1.

The Coming Expositions.

In our issue of Dec. 21st we gave a notice under the above head, of the Vienna and Centennial Expositions, but neglected to mention either of the following which will come off this year.

The London International Exhibition of 1873 Will be the third of the series of annual international exhibitions of selected works of fine art (including music), industrial and recent scientific inventions and discoveries, under the direction of Her Majesty's Commissioners for the Exhibition of 1851. It will be opened at South Kensington, in London, in April, 1873, and closed in October, 1873. The productions of all nations will be admitted, subject to the decision of competent judges as to their being worthy of exhibition, and provided they have not been exhibited in the previous exhibitions of the series. The exhibition is separated into three divisions: Fine arts—applied or not applied to works of utility executed since 1863; manufactures—machinery, substances and processes; recent scientific inventions and new discoveries of all kinds. Shafting, power, glass-cases, stands, fittings, etc., will be furnished free of cost, if Her Majesty's Commissioners are notified before the 31st of January, 1873. America excels in some of the branches of manufactures which will form the industrial portion of this exhibition, notably in food productions and the application of machinery to the making of carriage wheels.

The Society for the Encouragement of Arts, Manufactures and Commerce, offer three money-prizes for the best cabs which are to be exhibited at this fair. It must be certified to that these vehicles have been in practical use for three months before the delivery—the first Saturday in April. The defects in the vehicles now are want of room, seats too high, difficulty in getting in or out on account of steps and large wheels, window-opening arrangements, want of ventilation and locking of wheels on four-wheelers. Here is a chance for inventors to make a fortune.

The Metropolitan Intercolonial Exhibition of 1873

Will be held at Sydney, New South Wales, commencing April 22d, 1873. The Agricultural Society of New South Wales has been in communication with the Mechanics' Institute of this city, asking us to be represented there, as the products of California are analogous to theirs, and it would be interesting to see them competing with one another. For them to receive implements and manufactured articles would, no doubt, be conducive to business orders to a great extent, since at the close of the exhibition a sale of exhibits is to be held.

The show is said to bring into town some 150,000 people from the interior, and the prices realized by the goods thus disposed of and the orders taken for further supplies of the same are sufficient to induce all the Australian Colonies to join in the exhibition. The prizes for wines are elaborate as are those for horses, cattle, sheep, goats, poultry, dogs, wool, etc. The non-agricultural departments comprise articles which have originality; utility in the highest degree; the representation of some process, manufacture, invention or discovery likely to be of special advantage to the colonies. It is to be hoped that the manufacturers of California will extend their reputation by sending their products to this exhibition. Our foundries in particular would do well to send samples of mining machinery, pumps, etc., as it would no doubt be of benefit to them.

DAM BURST.—The dam of the immense water reservoir of the Spring Valley Mining Company, located a short distance from Oroville, was broken on Saturday morning by the heavy rains of the past few days, and its gates, flumes, and other property within the reach of the avalanche of water were all destroyed. The work is stated to have cost \$80,000, and the reported loss of the Company is from \$50,000 to \$60,000. The accident, and especially at this season of the year, is very unfortunate for the enterprising mine owners.

The First Quartz Mill in California.

The two cuts shown on this page represent the stamps of the mill of the Keystone mine, Amador county, California, and the old mill, as it originally appeared. We have been told that this was the first mill ever built in this State,

THE FIRST (?) QUARTZ MILL IN CALIFORNIA.

but this appears to be a disputed question. Some parties claim that the first one was built in Tuolumne county; others that it was in Calaveras county; others in Grass Valley, and others again say that it was erected in Amador county. We had the engravings made to show the appearance of this old mill, with its water-wheel, etc., and also to show the appearance of

ponnds, requiring 25 tons of melted metal, allowing for waste, finishing, etc. It was at first supposed that it would be necessary to have the casting made in the East but the Risdon Iron Works concluded to undertake it notwithstanding the necessity of new tools, etc., for this immense piece of work. A new pit was made and a crane of 20 tons capacity, with pat-

THE SAME WITH IMPROVED BATTERY.

terns, cones, moulds, etc. When tried the cylinder will be 105 1/2 inches in diameter inside and 13 feet 8 1/4 inches in length. One week will be required to cool the metal and several weeks more to bore and finish the cylinder. It is expected to be in its place ready for work in the steamer in two months from the signing of the contract.

THE OLD YEAR.—We cannot say the old year sleeps, for it is dead! May we not hope, that all that transpired of evil during its life, died with it, bequeathing only goodness and happiness to the young New Year.

A Monster Casting.

At the Risdon Iron Works, in this city, the largest piece of casting ever made on this coast was perfected on New Years day. It was a new cylinder for the Pacific Mail steamer, Arizona. The cylinder in the rough weighs 43,000

jobs will be undertaken here, and we hope to see all steamship work of every description given to our local foundries instead of sending away from home for it. The Superintendent of the Risdon Works is Joseph Moore; Robert Raphael is foreman moulder. The foremen in charge of this special piece of work were Edward Jones and A. R. Wilson.

A New Volume.

The present number marks the commencement of the twenty-sixth volume of the MINING AND SCIENTIFIC PRESS, and we may be pardoned for alluding to the fact that it has now attained an age and importance which has given it a high position among the class journal of the country, whether on the Pacific or Atlantic side.

The plan on which it is conducted is evidently popular with its readers. The arrangement of the matter of the paper into departments, so that the reader knows just where to turn for any particular class of information, enables him to more easily comprehend and arrange in his own mind the information contained in each successive issue.

The great object of the paper is the diffusion of useful information, more particularly among miners and mechanics, and by a constant and regular perusal of its columns, more valuable and practical knowledge can be obtained by such readers than from ten times its cost in books or other publications.

In commencing a new volume we have but to repeat our assurances of continuous effort. No means will be left untried to secure, at the earliest moment, every class of information new and important to the miner and mechanic, and we are determined to do all we can to render the present volume more valuable to its readers than any preceding one.

Our correspondence will be more extended. Mr. A. B. Paul has promised that our readers shall hear from him every month; "L. P. Mc." still remains with us; we are promised correspondence from Vienna, from Mr. Knstel, the California commissioner. We have made special arrangements for an interesting series of articles on hydraulic deposits and mining, which will be accompanied with appropriate illustrations. We shall commence, next week, a series of articles on mining geology, descriptive of the manner and occurrence of gold, silver and other minerals on this coast, prepared by Amos Bowman, Esq. Mr. Hanka has also promised us a series of articles which will be found of special and practical importance to our mining readers. More critical attention will be paid to the mining summary than heretofore.

We commence this week the publication, from the New Code, of all the California laws relating to mining and mining corporations, which we shall also issue in pamphlet form, for more general circulation and more convenient reference. The market reports will hereafter receive increased attention, and be more fully reported.

NEW INCORPORATIONS.—The unusually large number of incorporations this week is a noticeable feature; the majority of them are formed for the purposes of mining as will be seen by the list published in another column. This is the largest list we ever recollect having seen in one week, much larger than at the time of the excitement in stocks at the beginning of last year. By forming the companies in December, the provisions of the New Code are avoided, as it came into effect on the 1st inst. Now ten per cent. of capital stock must be paid up.

MISCELLANEOUS.

Practical Uses of Geology.

The object of geological investigations and the general result of such inquiries being understood, it remains to consider the various modes of its application to practical purposes in useful detail, so that we may clearly prove that this science, which not long ago amused the public mind, and alarmed the timid with vague speculations and unfounded theories concerning the origin of things, now involves much that is necessary to be known, and has become an essential part of sound education; being, in fact, so important to the engineer and miner as astronomy is to the navigator. Since, however, it is the case that geology embraces a wide range of subjects, some of which bear more directly on the natural history of living and extinct races of animals and vegetables, while others are more strictly mechanical,—and that the latter are those chiefly concerned in the practical application with which we have to deal,—a very brief summary of such facts may be useful in entering on a new department of the subject. It will appear, on a little consideration, that the facts in question are of very distinct kinds, and may be considered separately; for we may regard the earth's crust either as the place upon which, or within, various operations are to be performed, or we may regard it as the great depository of all useful and valuable mineral substances, of whatever nature. Thus the agriculturist will regard the earth and the rocks present in his district as providing the soil, and supporting the plant mechanically; but he may also look for valuable minerals to mix with his soil on the surface, and may be obliged to consider what hidden but determinable facts will interfere with or assist his draining.

So again, the architect and engineer will require to dig in some places for stone and clay, in order that they may erect some structure in another place, where it is important that the foundation should be sound, and where no unusual difficulties need be anticipated. And so also the miner, while he is merely anxious to extract mineral wealth, must also regard and carefully estimate the difficulties he will have to contend with, while piercing to great depths beneath the surface, or hurrying to a distance within a hill. Now in order to understand the application of geology thus presented, it is necessary to be familiar with certain principles and facts, relating chiefly to those masses of matter already described as rocks, and concerning which it is important that the practical geologist should know both their mechanical and chemical condition, and their mechanical position. Such facts duly appreciated, and the basis of geological science once laid, it is useful to notice how completely, not only the earth structure but the habits and even civilization of its inhabitants, corresponds to this geological condition. Thus in our own country it has often been observed that the inhabitants of the mountain districts differ much from those of the plains, while those of the lowlands vary according to the nature of the underlying rock, because that influences the cultivation. The geological structure and configuration of any country are the main foundations of its physical aspect; and the various operations of elevation, depression, and denudation, which it is the object of the geologist to study, are in effect the cause of all modification of the aspect and structure as originally impressed. Thus the mere fact of a line of hills in a country or a district, sloping gradually on one side and much steeper on the opposite side—or elsewhere, of hills rising regularly and with monotony—will of itself mark the physical cause of such appearance, whether it is due to a distinct elevation, or to the outcrop of some hard bed. Wherever distinct and definite physical features occur, some geological cause may always be traced; and on the other hand, every important geological event that has last happened in a district, is indicated by physical features.

A knowledge of this is often extremely useful to the traveler; for in this way he may determine the probable direction, or even the possible existence of rivers and mountain ridges, and also the places where natural mineral riches are likely to be found. The nature and use of geological maps and sections—of which many and excellent examples are produced by the geological survey, may also be recognized in their application to important practical questions constantly arising in agriculture, agricultural engineering, architecture, civil and military engineering, and mining. Each of these pursuits and professions having reference to material obtained from the earth, and also to the earth as the basis of operations, involves many facts of direct geological interest. It is only by a knowledge of geology, and of the mode of applying such knowledge, that much progress can be made in the higher and more suggestive departments of these sciences, and will not be considered that there has been any unnecessary consideration of details in what has been said concerning the nature of rock masses, their chemical composition, the mode in which they were aggregated, and the changes they have since undergone. These facts being the foundation of practical geology, are in every way worthy of careful consideration, and cannot be to well understood or too often

thought of by practical men. Whilst the application of geology to agriculture, engineering, and mining, are direct and immediate, and requires each in its turn the careful attention of the student, there is one other less manifest but equally connected with this subject, that may be regarded as preliminary. It is not alone to mechanical arts and appliances that the study of nature is essential. It is equally so to those who would represent the varied physiognomy of nature in its rocks and mountains, hills, valleys, and plains, and who for this purpose learn the arts of drawing and painting, and apply them to represent the forms and colors that please the eye and instruct the intellect. The artist as well as the engineer, and the critic in art as well as the artist, require knowledge and science, that the one may produce, and the other recognize and appreciate, a true transcript of nature.—*Anstead.*

Klamath River Mines.

Remarkable Gravel Deposits of the Lower Klamath—A Sketch of their Geology.

The upper portions of the Klamath River and its tributaries, the Trinity, Salmon and other streams, have long been the scene of active placer and hydraulic mining. But little attention has, however, been given, up to this time, to the remarkable deposits on the main river, toward its mouth. This is partly owing to the fact that about the time prospecting had commenced in the section, the silver excitement drew off the restless spirits who perform the pioneer-work in all mineral development. Being off the regular routes of travel, and not easily accessible from stage or steamboat lines, and, in addition, being the home of Indians alone, few white inhabitants being found for many miles above its mouth, the gravel deposits of the lower river have remained unnoticed—almost untouched—while others, in different portions of the State, were being actively worked, and, as a rule, paying the owners better than any other class of gold-mining. To be geologist, however, and the practical miner, these deposits offer a field of interest and profit second only to the famous blue gravel mines, which they resemble in many particulars.

Geology of the Deposits.

It is probable, however, that they are not the deposition of an ancient river, but that of the present stream, under different conditions from that now existing. In order to present a theory of their formation, it is necessary to take into account the character of the river and underlying rock-strata through which it has cut its way. The Klamath drains an immense extent of mountainous country, through which passes the great auriferous belt of California, as evidenced by the rich quartz-lodes and placer mines on the tributaries. Being a swift and deep stream, great quantities of water-worn gravel are swept down by the resistless floods of winter. These form at present as gravel bars, increasing in extent towards the mouth, all more or less auriferous, and their presence can be easily accounted for. A remarkable distinction should be noticed here. A remarkable observer who has watched the action of the surf rolling up pebbles on a sea or lake beach has noticed that the shape assumed by the stones is that of a sphere, the grinding action being equal on all sides. On the contrary, the gravel worn by river action alone will be flattened or oblong in shape, the continuous flow of the river being in one direction and the gravel wearing more rapidly on one side than the other. Hence, when deposits of water-worn gravel, flattened rather than rounded in shape, are found four and five hundred feet above the present level of the stream, one must seek some other solution than that of present action, as no flood, however great, could have piled up these masses of gravel.

How the River has Worn Down its Bed.

This solution can be found on observation of the rock strata forming the river bed and cropping out on the sides. Commencing at the mouth of the stream, one will notice that this strata consists of ledges of metamorphic sandstone of an exceedingly hard nature, and that it continues to appear for about fifteen or twenty miles as you ascend. In this section, although the gravel bars formed by the present by action of the river are frequent, yet no old deposits are found on the banks. At the end of this stretch of fifteen or twenty miles, the character suddenly changes. A soft micaceous slate now appears dipping at an angle of 15 degrees to 45 degrees against the stream. This gradually rises as you proceed up the river until at a distance of thirty miles from the mouth it is seen cropping out many feet above the level of the stream. It is in this portion that the great banks of gravel appear on the sides. On investigation of the causes that formed them, one is instantly struck by the fact that they are invariably found above and below a rapid or fall in the river, and that the bed rock at these rapids is a hard talcose slate or serpentine. This vein can be seen on the sides of the river also, and suggests a theory. It is that the river, which now has a fall of 234 feet in the thirty miles from the deposits to the mouth, was at one time many hundreds of feet above its present level. Wearing away the soft slate it has met with an obstacle in the dykes of serpentine forming their lofty waterfalls. Here the gravel was deposited, in the still reach above the eddies below. Gradually the action of the water has worn away the serpentine, until, what was perhaps a thousand years ago a

great fall, is now a rapid, over which canoes can be taken. That this is the case, evidence in point is offered by a celebrated and once dreaded rapid, called the Mereep, about 34 miles from this mouth. Within the memory of the oldest white inhabitant of the river, the Indians were accustomed to land at the foot of this rapid and haul their canoes over the bank as the fall was too great to stem going up, and dangerous to run going down. At the present time no difficulty is experienced in poing up or in peddling down. As the river cuts its way down, it also changed its course, perhaps many times, so that the deposits are now on one side then on the other of the present bed. Opposite the gravel beds is usually a bare mountain of rock, rising abruptly from the stream.

Origin of the Gold Bluff Formation.

It is said by some of the old prospectors that, starting at the point where the sandstone formation commences, the gravel can be traced through the mountains, good prospects being found even on the summits and that it finally ends in the immense cliff known as the Gold Bluff, 25 miles below the present mouth of the Klamath. The spot, the scene of one of the early excitements, is at the present time the theatre of active beach mining operations.

The sea having for ages performed the part of an hydraulic mining pipe has washed down the gravel bluff and separated the black sand, the gold now being gathered from it when the heavy gales of winter throw it up on the shore. However, this assertion, in regard to the continuation of the gravel through the mountains may be, the writer is not prepared to affirm from personal observation.

Description of an Auriferous Stratum.

Of the deposits on the river one will serve as a sample. This is located about thirty miles from the mouth, and the cut into the hill is 384 feet above the stream and some 500 yards away. The surface bank exposed is about 100 feet, and shows alternate strata of gravel and sand. The bed rock is the same soft slate seen along the river, and is worn into pot-holes and grooves by the old eddies. Above this is a stratum of blue gravel (so-called), decomposed talcose slate, in reality, most probably the wearings of the dykes before referred to. The stratum is from five to sixteen feet in thickness, and is of course the richest. Above it a reddish or yellow river gravel mixed with sand, and an occasional streak of oxide of iron forming a soft cement.

This entire bank of gravel, as prospected by washing out pans-full from each layer, showed gold at the bottom of each pan, or what is called a color. In the stratum of blue gravel the gold was rather coarse and the pieces flat or oblong in shape, averaging something like two or three cents to the pan. This claim is now in successful operation and will doubtless repay its owners handsomely for the labor expended on it, as they have an abundance of water and a great fall for tailings.

Advantages for Hydraulic Operations and for Settlement.

Were, however, the most improved methods in use in Grass Valley and elsewhere, to replace the rude manner in which this and other of these deposits have been and are now being worked, it is believed that their product would soon attract great attention, as the gold is remarkably pure in character. The climate in the vicinity of the mines is very different from the coast, being hot in summer, with long, rainy winters, but no snow. Peaches, melons and tomatoes will ripen and arrive at great perfection, which they will not do on the coast line.

The gravelly soil seems to be especially adapted to the grape, which grows thrifty and ripens early.

In the vicinity of these deposits are also found fine groves of cedar, sugar pine and redwood, which, in time, when mills will be erected, will furnish an abundance of lumber for mining purposes. Now that the new mineral law allows acquisition of titles to mining property, it is to be hoped that these deposits will receive more attention from our miners and prospectors than they have hitherto done, and that they may add another element to the rapidly increasing mineral wealth of our State.

MINING FOR TIN.—There seems to be a reality in the Australian tin mines, as we read that 51,000 acres of tin-land, taken up bear an annual rental of \$60,000. Some of this land covers and pays rental in consideration of copper mines, but by far the greater portion is set down as "tin selections." The lands are in New South Wales, and the reports speak of very large discoveries.

We hear a good deal, from time to time, of the shaky condition of the Cornwall mines, and how they are to see their best day in consequence of some new finding of tin in other countries. They manage, however, to maintain what is sometimes called a "visibility," though their profits are set down as a very small item, out of all proportion, however, a Californian would think, to their reported values. For instance, the Grenville is valued at \$250,000; Treligh Wood, \$750,000; Van, \$3,000,000; Roman Gravel, \$1,000,000 and East Slanguoy \$1,000,000. Seventeen other mines are set down as worth from \$50,000 to \$60,000 each.

The values will probably be kept up until other valuable discoveries are made, which give native promise of furnishing the needed supply of this metal at a price much below that at which it can be produced at the deep and low per cent. mines above referred to.

Another "Ancient City."

Col. W. T. Roberts, who recently went down to Arizona, hunting for diamonds, etc., reports the discovery of the ruins of an ancient city, which covers an area of about three square miles. It was enclosed by a wall of sandstone neatly quarried and dressed, ten or twelve feet thick, and which, judged by the debris, was fifteen or twenty feet high before its fall. In most places it had crumbled away and fallen, and was covered with sand, but in many places it was still standing six or eight feet above the sand-banks which had drifted around it. The entire area inside of this had at one time been covered with houses, built of solid sandstone, which showed excellent masonry in their construction. This ancient city is situated in Arizona, about ninety miles from the boundary line between Utah and Arizona, and the same distance from the western Colorado line. It has the appearance of being an old Aztec city that has been deserted for hundreds of years and fallen to ruins. It is entirely of stone, and not a stick of worked timber is to be found among the ruins. Nothing but the walls are standing, and none of them now are left more than eight or ten feet above the sand, which is eight or ten feet deep. The walls still bear the traces of many hieroglyphics, cut deep into them, showing various Indian customs and superstitions. There are also the ruins of stately monuments, built of square block sandstone, well quarried and showing good masonry, which are worked with notches and crosses cut into them at regular intervals.

The city is covered with sand, which it is thought has blown there from the desert. The sand has become solid and packed by the rains. Under the sand is a layer of blue clay, six or eight feet deep. No bones, implements or relics of any kind were found, with the exception of some pieces of pottery of dark color. These were embellished with paintings of flowers and ornamental figures in blue colors. The coloring matter is of a blue mineral substance of some kind. It is perfectly indelible, and pieces of pottery which have been exposed to storms, which have worn away the solid masonry of the walls of the city, show their colors as fresh and bright to all appearances as when new. The pottery itself has been found to be perfectly fire-proof upon trial in crucibles and furnaces.

STREET CAR TRACKS.—Much complaint is made of the obstructions to ordinary travel presented by the street car tracks of this and other cities in the United States. The most or all this objection could be avoided by the adoption of the English form of street car tracks. The car tracks in London consist of a flat strip of iron, with a groove for the flange of the wheel to run in. The rail is not sunk, but laid exactly level with the surface of the pavement, thus presenting no obstacles to ordinary vehicles. The cars are constructed with outside seats as well as inside. If the plan of track described works well in London, why will it not also answer for San Francisco?

THE REPORTED CHICAGO GRAIN FRAUDS.—Some of the Chicago papers are demanding that the grain stored in that city be weighed so as to ascertain the exact amount, as it is believed by many that the quantity stated as stored does not exist, except on paper. It is stated, that one railroad has reported 100,000 bushels received, while the Inspector claims that not one-tenth the amount actually came into that city over that road. Also, that the weekly statement shows an increase, while the total additions of receipts and exports show a decrease.

THE LAKE SUPERIOR TIN DISCOVERIES.—The *Perlaye Lake Gazette*, of a late date, says:—The unaccountable mystery that has surrounded the claimed discovery of tin upon the north shore of Lake Superior, and the inevitable relations that have existed between the discoverer and certain parties to whom he had sold interests, will, it is believed, soon culminate in certain knowledge of either the worthlessness or the value of the find. A party of gentlemen representing large interests in the property, together with several experts and press representatives, started last week with the original discoverer, who proposes to fully satisfy them of the genuineness of his claim.

The nickel mine in Lancaster county, Penn., from whence the nickel for the United States coinage is obtained, has been worked for seven years, and developed to a depth of two hundred feet. The length of the lode is between two and three thousand feet, and it produces from four hundred to six hundred tons per month, employing in the working of the mine a force of one hundred and seventy-five men. One mine, the Mine la Motte tract, Missouri, was worked from 1850 to 1855. About \$100,000 was realized from the croppings of the vein. Croppings of nickel ore are found also in Madison, Iron and Wayne counties, Missouri. The refined metal is worth \$3 per pound.

MECHANICAL PROGRESS.

Bessemer's Steady Ship Saloon.

The saloon devised for use on Mr. Bessemer's Anti-Seasick Channel Boat is said to be a marvel of mechanical ingenuity. A saloon floor of working size has been constructed and put in operation near his residence, in connection with a mechanical apparatus which is said to impart to it all the motions to which it would be subjected within a ship's hull, and in a heavy, chopping sea. The visitor, when he steps upon the improvised deck, if at all liable to such sensations, soon becomes subject to all the phenomena of sea-sickness; while if he enters the "saloon" he feels no disagreeable motion, or none at least which will produce sea-sickness. The *London Times* describes the device substantially as follows:—

Looking into the functions to be performed by this governing mechanism in the proposed ship, we first have to suppose a large and strong floor, which, at its ends and at two intermediate points of its length, rests on steel axes, of about the diameter of the driving axle of a locomotive. The supporting frames are securely fixed to the double bottom of the vessel. This floor, then, is capable of a motion like the beam of a pumping engine. By raising the sides of the floor and covering it in with a roof it forms a saloon, and if as much dead weight be placed below the beams of the floor as will counterbalance the upper part of the structure the saloon will be in a state of equilibrium and capable of motion on its axis. In this condition it is liable to be put in motion by the movement of passengers or by the force of the wind blowing against the upper part.

Hydraulic power being here judiciously applied prevents any such erratic motion, and affords a means of retaining the saloon in a vertical position at the will of the man operating the apparatus, notwithstanding that the vessel in which it rests is moving beneath it. In order to effect this end a toothed sector of large diameter is secured to the main central axis of the structure, and beneath it is a strong bed plate firmly attached to the floor of the ship. On this bed plate are two hydraulic cylinders, to which a double-ended ram is fitted, the central part of the ram being provided with teeth, which gear into the sector. Therefore, when the ship is in a state of rest, the sliding in and out of the rams will cause the saloon to move on its own axis with a gentle but powerful motion. These movements, however, are controlled by a pair of delicately balanced equilibrium valves.

Hence, it will be seen that when the ship is rolling at sea the power of acting on the saloon enables the steersman to retain the saloon constantly in a perfectly vertical position, while the floor of the ship rises and falls beneath it. The essential point of this very ingenious arrangement is that the hydraulic apparatus has not to put the saloon in motion, but simply to prevent it acquiring any motion. Moreover, the *vis inertiae* of a structure like the saloon, which will weigh some 70 or 80 tons, will greatly assist in resisting the initial tendency to motion.

In other respects Mr. Bessemer's saloon offers undoubted advantages. Resting, as it will, on four axial supports bedded on an elastic packing of large area, it will be completely insulated, and will not be susceptible to the violent tremulous motion imparted by the engines and paddles. Again, the heavy thud of the sea against the sides of the ship, so objectionable in cabins built against the framing of the vessel, will be wholly unfelt, as there will be a space of five feet between the saloon and the sides of the ship, from which, in fact, it will be totally disconnected. Before long the merits of the invention will be put to the test in a couple of vessels built from Mr. Reed's designs, and it is the opinion of all who are competent to form one, that in them Mr. Bessemer will find his expectations fully realized.

The invention is an ingenious application of well known mechanical principles, wherein hydrostatic force in transmitting power and in regulating the irregular action of the machine forms an interesting and most essential feature. Mr. Bessemer has already manifested much ingenuity in his various applications of hydrostatic force; but if we except this new application, perhaps, the most remarkable of all the various purposes for which he has introduced hydraulic apparatus is its application to the movement of the large converting vessels used in his steel manufacture. These vessels weighing from 10 to 20 tons are under the absolute control of a boy placed 60 feet above them, when by means of a simple handle he can alter their position to the fractional part of an inch, or move them entirely around a circle, although their fluid contents—to say nothing of the weight of the converters themselves—of five tons, are constantly changing their balance.

With this successful appliance in mind, it is easy to perceive how readily Mr. Bessemer might control the unwieldy and irregular movements of even such a mammoth thing as a 70-foot steamboat saloon, loaded with a full complement of passengers.

Resistance of Building-Stone to Heat.

The great fires at Chicago and New York have attracted much attention to the relative values of different kinds of building-stone in resisting the heat generated in great conflagrations. Mr. Wight, after the Chicago fire, carefully collected such facts and evidence as seemed most pertinent to this question, and embodied the same in an address before the American Institute of Architects, at Boston.

It is stated that in the Chicago fire none of the limestones stood the test of heat; but some were worse than others. The Illinois limestone "was, in very many instances, entirely calcined." "With regard to this stone," says Mr. Wight, "it was a common thing for it to explode when the heat came suddenly upon it and was very intense. It seemed to calcine with great rapidity, and I suppose the effect was very much like that seen in the manufacture of popcorn."

The limestones used for building consist essentially of carbonates of lime, or of carbonate of lime and magnesia—the latter being known as dolomite. When limestone is exposed to a red heat, the carbonic acid is driven off and the stone crumbles into "burnt lime." Limestone free from magnesia, however, will stand a much higher heat than the dolomite—the latter crumbling at 600° Fahr., a temperature which leaves the former intact. Mr. Wight speaks of the so-called "petroleum stone," which was reported to be entirely consumed, but which, in fact, stood the heat very well. There was one church in Chicago built of this stone, in which the amount of oil was so great that the heat of the sun would draw it out soon after the stone was set up in a wall, and it would run down in black streaks. "The effect of the heat on the inside of the walls threw out upon the exterior all the oil it contained, which formed a thick, hard coating, about a quarter of an inch in thickness; and though the interior of the church was exposed to great heat, and every particle of wood in it was burned up so that there was not a scrap left in it, the interior sides of its walls were not greatly injured. In some places the stone had flaked off, and yet this stone stood the test better than any other natural stone used in the city."

The great resistance of this stone to the heat was not, of course, due to the oil which it contained; but to the fact that, though called a limestone, it really contained from 20 to 30 per cent. of silica and alumina, which substances, the latter in particular, are distinguished for their capacity to resist heat. Their presence, intimately mixed with the lime, protects it from disintegrating. The oil on the interior of the wall was protected from burning from the fact that the interior of the building was inaccessible to the free entrance of air.

Sandstones stood the heat best at Chicago, and proved the excellence of that material for fire-proof structures. The only building in the burnt district of the south side at Chicago, which stood intact, was of Cleveland sandstone. "In that building there was not a flaw, nothing cracked or broken." Sandstone is made up of from 80 to 90 per cent. of silica, the balance consisting of alumina, lime, magnesia, iron, etc. The oxide of iron is usually the cementing material.

Granite, quartz, slate, and most other rocks of that class used for building purposes, are liable to crack, oftentimes in an explosive manner. This is due to the fact that they contain a considerable quantity of water, mechanically held within their interstices. Quarrymen and miners will often, on examining the walls of such rocks immediately after blasting, notice that they are more or less moist—the moisture being sometimes so great as to collect in drops and even run down the face of the recent fracture. This moisture is retained in building blocks, and when great heat is applied, being converted into steam, causes explosions, as above. Sandstone is quite free from moisture; hence, chiefly, its power to resist the action of heat.

Artificial stones, composed of silicate of lime and alumina, with water chemically combined—not mechanically enclosed—are of the nature of sandstones, and are well-calculated to resist heat. It is said that large numbers of the Frear stone blocks which passed through the Chicago fire, and which do not contain any free water, are being used the second time in the construction of other buildings.

Bricks, if of good quality, resist the action of fire very well. If they contain material which vitrifies readily they lose their strength and succumb. True, they absorb water easily, but they part with it so readily that no danger ensues from that cause. When good bricks are built into a wall of proper thickness they form about as indestructible a material as can be used for resisting a great heat.

We have not as yet seen any report upon the particular and comparative effect of heat upon the stone and brick material subjected to the heat of the recent Boston fire. Careful observations have no doubt been made, the results of which will doubtless ere long find their way into print. Quite too little attention is paid by builders and architects to the heat resisting capacity of the stone they use. More attention is paid to the crushing strain which it will bear and the facility with which it may be worked. Mineralogy and chemistry are quite as essential to the architect in determining the selection of his building materials as is the hydraulic press.

SCIENTIFIC PROGRESS.

Experiments in Nature's Laboratory.

The experimental method, now so universally accepted as the sole means of arriving at scientific facts, is mostly carried out in laboratories provided with more or less expensive apparatus, which, however large and commodious, rivals in a pitifully small degree the grand, subtle, and delicate appliances of nature. No artificial arrangements can emulate the enormous pressures to which in nature various materials are subjected. No furnace constructed by man, though seven times heated, can approach in intensity of action the heat of volcanic origin; and this last is, so to speak, cold when compared to the high temperatures of the solar atmosphere.

What comparison can be made between all the varied and skillfully contrived apparatus of modern chemistry and that which exists in the respiratory, digestive, and circulatory organs of animals, or even plants? Not all the instruments and processes yet devised by man for investigation of organic chemistry are equal to the construction of a blood-corpuscle, a cell, or an animal tissue. We know that these things are produced in obedience to law, as surely as that winds blow, iron rusts, and rivers flow in accordance with fixed and invariable principles. Could we establish the proper conditions, a blood-corpuscle would result.

The feeble experiments of the philosopher are merely attempts to establish in each case a determinate set of conditions. This done, he awaits results. It is only through the agency of natural law that he establishes conditions, he himself acting in as blind obedience to law as does the cloud from which he culls a specimen. He even thinks in obedience to law, from which he can no more escape than matter can escape from the mysterious influence called gravity.

People often speak about violating a law of nature, and of the punishment which follows such violation. The fact is, however, that there is no such thing as breaking through natural law. If we eat that which nourishes us, we are nourished according to law. If we take arsenic, it acts to poison us in obedience to other provisions of the same inexorable code. Tobacco entails nervous and other disorders upon man, when used as a stimulant, under the same law that it kills ticks on lambs. Nature is perfectly indifferent whether a flame burns sticks or our fingers. It is the eternal fiat that gases heated to incandescence shall produce certain effects on certain other substances, and neither sticks nor fingers can evade the everlasting unchangeable decree. Underlying the ever-changing complexity of phenomena is the never-changing, inflexible, sternly coherent law, so much superior to the puny will and strength of man that one wonders at even the careless application to it of the term "violation."

It is questionable whether, in the search for artificial appliances through which to control conditions, we have not in some measure come to underrate the value of close observation of results of conditions already established in nature.

It is quite recent that we have learned to appreciate the possible effects of winds in abrading rocks exposed to their action. The artificial application of the sand blast to the cutting of the hardest substances within the last two or three years is only a repetition of a process which has been going on under the eyes of mankind for ages.

Who has ever thought of consulting any of the processes going on in the natural world for confirmation or negation of the elementary character of those substances now called chemical elements? Who has said, "Inasmuch as the chemical processes of digestion and assimilation are infinitely more refined than any I can conduct, let me see whether in the animal or vegetable economy phosphorus or sulphur (which are, to say at least, open to the suspicion of compound character) is not sometimes produced from food which contains neither?" Should such a fact ever be discovered, it would as effectually settle the composite character of phosphorus or sulphur as could the most successful laboratory analysis.

All honor to the splendid corps of investigators—now, thank God! in no want of recruits—who are forcing their way into the interpenetration of nature in schools, in laboratories, in shops, and in garrets! All honor to the genius that has given us the balance, the thermometer, and the barometer; that has widened our field of vision by the microscope, the telescope, and the spectroscope! All honor to him, though the humblest, who has added one implement to our common stock! Yet, with due reverence to genius we believe there is something to be seen with unaided eyes, and outside the laboratories and observatories of our universities.—*Am. Artisan.*

NICKLE AS A GAS OCCLUDER.—Prof. Raoult of Grenoble, has proved that nickle employed for twelve hours as a negative electrode in a voltameter, condenses at least 150 times its volume of hydrogen and abandons entirely this gas, when it is taken from the voltameter and plunged in water. M. Raoult has made several experiments on the production of caloric and has succeeded in demonstrating that the intensity of the heat developed by an electric current is independent of the system of battery by which the current is engendered.

Heating Water Above the Boiling Point in Open Vessels.

M. Donny, a French experimentalist, found that water deprived of air could be raised to a temperature of 230° Fahr., without boiling, and that evaporation then took place explosively, the water discharging a sufficient amount of steam at a single burst to reduce its temperature to that due the pressure to which it was exposed. M. Deluc observed the fact even earlier than Donny, and physicists have attacked the subject since.

M. Dufour, by taking the most delicate method and observing the greatest care to avoid contact of rough particles and metallic surfaces with the water, succeeded in raising the temperature of very minute globules 347° Fahr., which is that due to steam under a pressure of 115 pounds to the square inch. It is found necessary, however, in such experiments, to operate with very clean water in very small quantities, and to be exceedingly careful to avoid the slightest motion of the liquid, and also to keep it from contact with metallic surfaces or mineral substances.

M. Donny's experiments were made with glass vessels, but M. Dufour was compelled to suspend his drops of water in a mixture of oil of cloves and linseed oil, to secure the success of his experiment. Such conditions evidently never occur where water is vaporized in steam boilers, and we may probably feel confident that such superheating is not likely to produce steam boiler explosions. The mass of water in a steam-boiler is too large, and is invariably in contact with a metallic surface. It is probably always in motion, at least, to a slight extent, as the irregular distribution of heat in all ordinary boilers, must produce generally some slight circulation at all times; and finally it rarely happens that feed water is absolutely free from impurities. While, therefore, we cannot say positively that explosions have never occurred, from this cause, we are fully justified, probably, in supposing it to be the fact.—*Scientific American.*

Origin of Storms.

Mr. John Hepburn, of Gloucester, N. J., writes to the *Scientific American*, that a careful observation of twelve years past has satisfied him that "storms are nursed into being by the action of electricity from the sun, and that the rays of the sun drives the storms before them." He says: "I have made a specialty of watching the first traces of gust march, and I have invariably found that morning gusts come from the east; mid-day gusts from the south and evening gusts from the west, and I feel quite sure that if scientists will devote a little time to the first appearance of any coming gust, they will find and admit that there is truth in the theory I have advanced. I am of the opinion that solar electricity produces earth storms, and that most earthquakes are produced by the same agency."

He has noticed that black, stormy clouds advance from the sun, pass on beyond, or make a stand overhead, and in the latter case mix more and run into each other in very great commotion; then begin to break and act with fearful violence upon the earth, sending torrents of rain or hail in an opposite direction to that of its original march. He has also noticed gusts come up, along through the clouds, pass overhead, and for some distance beyond, then return against or at a greater or less angle to the sun's rays. What he appears to claim as his theory is, that the gusts are first set in motion in a line with and before the sun's rays; but that when once so put in motion the cloud thus formed may be driven more or less out of its direct motion by side currents, before it commences to discharge its aqueous contents, or otherwise expend its accumulated fury.

"GUMMATE OF IRON" PAPER.—Many years ago Fremy discovered, very unexpectedly at the time to the chemical world, that gum, instead of being, as previously held, an isomeric form of starch or cellulose, was the lime salt of a peculiar acid, gummic acid. The *British Journal of Photography* states that, very curiously, gummic acid combines with ferric oxyd, forming what may be called an iron gum. To coat paper, which is then sensitive to light, "a solution of perchloride of iron is taken, ammonia cautiously added with agitation until a permanent precipitate makes its appearance. The liquid then filtered, paper saturated with the solution, and allowed to dry in the dark. The coated sheets then floated on some thick mucilage of gum-arabic. The surface of the paper is thus covered with an even layer of the "gum-mate of iron." When the paper carrying the iron is first coated with the mucilage, the color does not at once change, but presently a strong, yellowish-brown tint is produced, and the gum "sets," and then the layer dries up, leaving the paper very flexible for a long time, and highly glazed."

THERE IS NO OBJECT UNWORTHY OF OUR NOTICE.—"While I am reading" says a careful student on natural history, "a fly settles on my hand; I don't kill it; I watch it, with a glass perhaps, and see it clean its wings and its head, and make friends with it till I feel I can speak to that fly; and so it is with everything living. If we will humble ourselves and condescend to look at the apparently lowest creatures, we shall find instruction in the meanest of them."

THURSDAY, Jan. 2d, 1880

SAVAGE.—During the week ending Dec. 28th, 784 tons of ore was extracted averaging \$34.32 per ton; 625 tons were sent to mill and 274 tons remain on dump.

HALE & NORCROSS.—The work of constructing the pumps, pump-beds and pump-tanks was finished on the 29th. During the week ending Dec. 28th, 810 tons of ore was extracted; 852 tons delivered to mills; and 1,058 tons remain on dump.

RAYMOND & ELY.—On the 27th ult. \$31,965 was shipped; previous shipments in December \$256,039, to which add last shipment, making a total of \$288,006 in 27 days; equal to \$10,662.82 per day. There was a strike at this mine last week on account of working hours. Full shifts of ten-hour men are now at work, although they struck for eight-hour shifts.

CEDERBURG.—This company have received 318 ounces of gold from 12 days' run of the mill.

EUREKA CONSOLIDATED.—Prospects are reported favorable for a large body of ore in the northwestern drift of the Lawton shaft. Three furnaces running.

EUREKA.—The last clean up for five days' run of ten stamps was 975 ounces of amalgam.

Geological Survey.

We call the attention of numerous parties who persist in this assertion that nothing has really been accomplished by Professor Whitney in the Geological Survey of California, to the following notice of the manner in which a map of his survey was received by the learned Professors of Cambridge:

At the November meeting of the Academy of Sciences, held at Cambridge, Mass., Professor J. D. Whitney read a paper entitled "Notice of the Progress of the Topographical Work of the Geological Survey of California." His elucidation of the work and the maps drew forth commendation from Professor Agassiz and Pierce, Professor Agassiz said he had been critically examining these maps, and was surprised at their extent their beauty and accuracy. The geological survey of France had been going on for more than thirty years, but had not produced so much in the way of topographical work as had been done in the short time of the ge-

ological survey of California. Prof. Pierce thought it was a work of immense national importance, and should not be interrupted.

Professor Whitney had worked through much adversity and difficulty, but he had been rewarded by such magnificent results, California had reason to be proud of the work and could not do less than carry it to a successful completion.

Palmer's Postal Telegraph Bill.

Palmer's bill providing for the establishment of a postal telegraph service will receive the almost unanimous approval of the Committee on Appropriations. Mr. Palmer gives some interesting statistics relative to the effect upon the press of England by the reduction of telegraph rates. Formerly the English telegraph sent news reports to only 173 journals in the year. Afterwards the Postoffice sent them to 467. The telegraph companies sent during the session of Parliament nearly 6,000 words daily, and during the remainder of the year 4,000 words daily. The Postoffice in the year afterwards, sent during the session of Parliament nearly 20,000 words daily, and during the remainder of the year nearly 15,000 words daily.

The increase in private business was at the same rates. Under the present system of telegraphing in the United States, there is not an adequate degree of accuracy, secrecy and promptness in delivery of messages.

Telegraph offices are often placed in the charge of boys immature in experience and education, and companies locate their offices in rooms devoted to other kinds of business and unprotected from the intrusion of curious and mischievous visitors. The Postoffice Department is sworn to secrecy. On the other hand, telegraph operators are under no legal obligations not to divulge the contents of messages.

Here is a mass of statistics which are unanswerable as arguments for the change demanded by the people in the telegraph system. They fortify the position assumed by the press of the country, and strengthen the bands of the friends of the measure everywhere. The opponents of this righteous and equalizing reform consist only of two gigantic monopolies—the Western Union Telegraph Company and the Associated Press.—*Eureka Sentinel.*

ARE POTATOES EXPLOSIVE?—The N. Y. *Gas*

Light Journal says that a few days since the engineer of Ryan's Pork House at Galsna, Ill., having heard that potatoes would keep the boiler free from scales, put half a bushel in it — used the engine one day only, when he opened the valves, let all the water out of the boiler, took off the head of the hand hole (7 by 9) placed it against the opening, covering it except sufficient space to admit his arm. Wishing to ascertain the effect of the potatoes, he attempted to put a lighted candle in the opening, when an explosion took place, throwing his hand back with great violence, and driving the loose hand-hole head with such force that it buried itself two feet deep into a coal pile in the rear, shaking the whole building and filling the room with a cloud of sooty substances. The engineer says that he saw nothing in this explosion that looked like fire or blaze, and that the boiler was not injured. The *Journal* though devoted especially to the discussion of subjects connected with gas, is unable to explain the mystery.

MAONIFICENT RUN.—The Salt Lake *Mining*

Journal, of December 19th, says:—One of the biggest runs of bullion evr made in the Territory, in the same length of time, has just been made by the Saturn Smelting Works at Sandy, of which Mr. S. M. Gerrish is the affable superintendent. In twenty-six days there was a run of 365 tons of bullion, which averaged 165 ounces.

RAILWAY enterprise has met with great success in Japsn. The first line has been opened with great *eclat*, and rapid traveling has proved so congenial to Japanese taste that three additional trains per day have been added to the original time-table.

INDIANA has rich mines of excellent coal, and furnaces just built can produce 50,000 tons of pig a year, while mills at Indianapolis, New Albany, Greencastle and Terra Haute produced 13,000 tons of rails in the past year.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

BUTTE COUNTY.

A VAST MINING CLAIM.—Butte Record, Dec. 28: A new placer has been found in Morris' Ravine, not far from the Cape Claim. The deposits are supposed to come from Table Mountain. There were rich claims in this vicinity in '42 to '50; but they were only skimmed over. Extensive preparations are making to work these gravels with hydraulic process, and the flumes for that purpose are nearly completed.

MORRIS RAVINE.—Butte Record: The extensive deposit into which Hendrick's Brothers 2,500 inches of water, under several hundred feet pressure, is cutting its way, is unmistakably of the same character as the deposits at Cherokee. Their ditch is fifty miles in length, taking water from the West Branch of Feather river, conveying it across depressions in huge iron pipes and around the mountain sides, until it debouches into a vast reservoir at the head of Morris Ravine. From thence it is carried in large pipes, under a head of 200 feet pressure, to the claim. Here a distributor divides the current into three pipes, each of which is attached to a hydraulic chisel, which hurls eight hundred inches of water against the face of the claim with great and irresistible force, before which the earth melts away, and even the bed-rock is torn up and thrown high in the air, shivered to atoms and blown away down the ravine. The chisels are worked by electricity, and operated each by a single man, and, after the flume is laid, and the mountain loosened with powder, do the work of mining. On a recent visit to this claim, we witnessed the power of one these monitors, in cutting a passage through the bed-rock for the flume. It was stationed above the head of the flume, and hurled 800 inches of water into the air, creating a large number of fountains in the direction of the head of the flume, cutting its way through the rock with the apparent precision and ease of a gardener's spade in yielding soil, and almost with the rapidity of electricity. It is but recently these vast arrangements have been perfected on this claim. Blasting tunnels have been run into a mountain almost as large as one of our Buttes, which will soon be shattered by a blast, fired by electricity, the buildings in the vicinity being barricaded by planks, to protect them from the falling dirt. The hydraulic chisel, under the direction of a single man, will do the balance of the work. Much coarse gold is found on the bed-rock in their claim. Their mining flume, which lies deep down in the bed-rock at the claim, extends for a distance of about 24 miles from north to south, and is four feet in width, of a firm and substantial structure, and paved with rock. It is their design to extend this flume down the river to Feather river, a short distance above Oroville, and opposite the river claim of '57, known as the famous Cape claim. It was the theory of the speculator then that the rich deposits found in the famous Cape, were washed down Morris Ravine from the deposit underlying Table Mountain.

CALAVERAS COUNTY.

YEABO.—Angels Mountain: This is the name of a new mining district situated in the southeast portion of this county, which has been located by a large number of capitalists. It is principally gravel digging, and of large extent. In the spring the company propose erecting hydraulic machinery with which to work their claims.

GWIN MINE.—Thirty-six stamps are now in operation giving an average of \$1,000 per day. The rock in the 800 and 600-ft. levels is high grade and improving as work progresses. The new pumps work nicely.

KERN.

THE MINES.—Havilah Miner: Providence never gave to earth a finer country for poor men than the county of Kern. The country is about 24 miles from north to south, and 120 miles from east to west, in extent. The mineral belt extends from the northern to the southern boundary of the county, and is forty miles in width—the whole eastern end of the county. Fully one-half of the gold belt has never been prospected. There are 4,000 lodges recorded in Kern county, of these, nineteen-twenty have been abandoned, one-fourth of these lodges will pay good wages—say from \$4 to \$20 per day to the man for working; always providing, the man himself does the labor—as has been amply demonstrated in every instance, where after large, splurging companies have failed, a company of from two to six have taken hold of the same mine, and not only proved the mine to be a good and valuable one, but made handsome profits out of it.

Antimony veins, sixty feet wide, have been discovered in Kern county. The ore, it is said, will yield from 75 to 80 per cent. of crude bullion, containing enough of silver to pay for the mining and reduction, leaving the smelter for net profit.

MENDOCINO COUNTY.

MINERAL.—A correspondent of the Democrat writing from Conway's Landing, on the coast, near Pt. Arenas announces the discovery on the ranch of W. Tift, of iron, coal and a peculiar and valuable species of clay. The iron deposits have not been prospected, but are believed to be sufficiently extensive to yield an abundance of ore. The coal has been tested in a blacksmith shop and is pronounced superior to Mt. Diablo coal. The deposits of clay, which are very extensive, consist of different layers of deep yellow and deep blue color. It is plastic and is susceptible of a high polish. Artistic mantel ornaments are made of it by the ladies of the family. When dried and burned it becomes very hard and very strong.

NEVADA COUNTY.

THE MANZANITA CLAIM.—Nevada Transcript, Dec. 27: The claims of the Manzanita Hill, just above town, are being fitted up by Roberts & Co., the new owners, in splendid trim for work. They have rebuilt the flume, repaired and enlarged the capacity of the ditch and are fitting up in the best manner for work. They expect to get their work done and have water about the 10th of January. They will run a head of 2,000 inches and the claims will be worked on a more extensive scale than ever before.

QUAKER HILL.—Nevada Transcript: The late storm has given water enough for washing in most of the hydraulic claims. The season is not much later than last, and the indications are that it will be equally as good. The claims of Jacobs & Sargent, at Quaker Hill, in which washing commenced last year on the 23d, started up this year on the 25th, or two days later. The weather during the season has been moderate, and there has been no freezing weather. This makes all the water which has fallen available for mining.

GOLD.—Grass Valley Union, Dec. 25: The Empire mine sent a brick of gold into town yesterday valued at about \$9,000. It was from a run of ten days. The Empire continues to show a rich ledge. Speaking of gold reds, we use to us to say that the article is coming in quite freely. Delano shipped over \$10,000 yesterday morning, most of which came in on Saturday.

BULLION.—The Eureka shipped yesterday gold bars valued at something over \$20,000, the product of ten stamps, after 12 days' run. The Idaho cleaned up \$12,000 after a run of 5 days. In the Idaho only the amalgamators were cleaned up. Three mines of Grass Valley (Eureka, Idaho and Empire) give to the money-circulation of the country something over \$41,000 as a Christmas present. The small mines of Grass Valley district give as much more, to say the least.

PLACER COUNTY.

JULIAN MILL AND MINING CO.—Auburn Argus, Dec. 27: This Co. have again resumed active operations with very

flattering prospects for the future. This company have erected one of the best 20-stamp quartz mills and hoisting works in the State.

THE ST. LAWRENCE MILL AND MINING CO.—Have about completed the erection of a first-class 12-stamp water-power mill on Auburn Ravine, about one-half mile from the town of Ophir. The company have nearly completed a tunnel which will tap the ledge at a depth of about 80 ft.

BELLEVUE.—This mine is yielding very rich ore from the tunnel ledge, and the rock taken from the shafts looks well.

THE GREEN.—Mine continues to furnish an abundance of very rich ore, full equal to any heretofore taken from this celebrated mine.

PLUMAS COUNTY.

GENESEE QUARTZ MINE.—Plumas National: To Mr. Wm. Eagle, who has been working in this mine for several months past, we are indebted for the following mining news: The claim was purchased, some months ago, by Mr. H. O. Bidwell and a San Francisco Company, from Mr. J. H. Blood for the sum of \$10,000. Work was commenced on the "East Hill," and in a short time the tunnel tapped a ledge, the rock from which has paid an average of \$10 per ton, and the 5-stamp mill has been running steadily. A shaft raised from the tunnel, to obtain good air, has developed a very rich "pocket," and some of the finest specimens ever taken from the ledge. A man of decomposed quartz yielded \$61, and Mr. Eagle is of the opinion that a two-inch "dreck" in the ledge will pay at a rate of \$100 to the pan. The prospects of the company are very bright just at present, and this claim promises to be very valuable for years to come. Every pound of quartz in the claim has more or less gold in it, and "pockets" fabulously rich are often found. We hope they will continue to prosper. The discovery of a ledge has been discovered in Tuolumne county, about sixty miles northeast of the town of Sonora. It assays a fraction over \$100 to the ton, and has a width of 30 ft. at the surface.

SAN DIEGO COUNTY.

BANNER DISTRICT.—Cor. San Diego Union, Dec. 20: Times are dull, just now, the weather colder than has been experienced for two years. The Kentuck mine looks well. They began stopping last week in the richest rock they have yet had. They are hoisting with their new whim, which works well. The Bailey boys, in the Ready Relief claim, are using hand-drills. They are taking out good rock and are doing well. The Golden Chariot is working 25 men. They began sinking on Monday last. Their new whim works very satisfactorily. The ledge is 4 ft. wide, of rich rock.

TUOLUMNE COUNTY.

PATTERSON MINE.—The Patterson, sometimes called the Tri-Color Mine, at Tuttle-town, Tuolumne Co., has been sold for J. J. Corrigan, of San Francisco, for \$30,000. This is an old mine, which has been worked more or less since 1857. The vein is a large one and well-defined. Two tunnels will be opened for the more convenient working of the mine, and a mill will be immediately erected.

GRIFFIN.—Tuolumne Independent, Dec. 28.—Dec. 28: Last week on the 600-ft. level in the Griffin mine, the vein was six ft. wide and very rich. Rock will go over \$300 per ton.

HESLEY.—At 300 ft. in the Hesley mine the vein is 10 ft. wide. Every shot they put in the rock, fine gold is perceptible.

COLUMBIA.—Quartz interests are reviving in and about this county. In all parts the pick and shovel are at work on the fodes for "pockets," to obtain means for more systematic working of the veins proper, many of which prospect splendidly. The proper development of the rich veins about Columbia and the American Camp district will put Columbia on her legs again.

The New Albany mine on the North Fork of Tuolumne, has been sold for a good price to a company in San Francisco, which propose to sink a shaft and prospect the lead thoroughly before putting up a mill—a practice not often carried out in quartz mining. The vein is about 3 ft. wide, with good prospects.

THE ALBERGNE.—This vein is at Algerine Camp; the lead is about 2 ft. wide and gold is distributed through the rock. Algerine was a flourishing camp in '53 and '54, and large quantities of gold and silver were taken from the places in the vicinity, before quartz mining was hardly known. A great part of the gold found has no doubt been fed from the various leads. The country is rich in quartz from Algerine to Rough and Ready.

Nevada.

BULLION.—Pioche Record, Dec. 22: The shipment of bullion for the past week has been \$34,249.33.

PAICOT TUNNEL.—Has been driven a distance of 1,136 ft., and the entire tunnel from mouth to face is a masterly piece of work. Thirty-five ft. from the face a drift is now being run. A ledge of some 8 ft. in width has been cut hearing north and south. From surveys made it is ascertained that the tunnel is 502 ft. from the surface. This proves conclusively that the veins of this district run to a great depth.

TEMBEWE.—This mine is situated on the southeast point of Casenknife mountain, and about 800 ft. north of Page and Panaca. The shaft has reached a depth of 55 ft. The ledge has been cross-cut at the above depth, showing it to be 10 ft. in width. Assays average \$100 per ton. Quartz of a peculiar character has presented itself, bearing large quantities of sulphurets of lead. There are two ledges now showing in the drift, running at right angles, and the miners in each gives evidence that at the proper depth an immense body will be struck. The work of sinking an incline is now in progress; both ways are plain and visible, but irregular. The selva and clay exceeds anything yet seen in Ely District.

SILVER PEAK.—The ore on the dump is very poor, only averaging about \$18 to the ton. The shaft is now at an incline depth of 140 ft. and sinking constantly.

PROCEE PROXIM.—This mine within the last week has opened up magnificently. Ore is constantly hoisted. SPRING COUNTRY TUNNEL.—Work is being carried on here in the ledge level, about 250 ft. from the mouth. The depth already attained is 35 ft., and soft ground has now been reached. The ledge is increasing in size.

CHIEF OF THE HILL.—A contract has been let to sink a shaft 100 ft. From portions of the mine from 5 to 5 tons of ore are being taken out daily. The shipment of bullion from the 1st of December to this date is \$5,728.36. On the Magnet mill dump there are 47 tons of ore waiting to be crushed.

AMADOR TUNNEL.—This tunnel has now reached 400 ft., and men are kept constantly at work. About 6 tons of ore are being taken out daily. During the last week a new ore house has been built.

SUNBEAM AND ORO.—Ore of a very rich character is being constantly hoisted, and the mill is steadily employed working the ores of both mines.

BOWERY.—Work on the contract is progressing rapidly. The present appearances give evidence of a rich strike before long.

PIKE.—This mine keeps turning out rich ore. Seventy-five tons are now lying on the dump. Arrangements have been made with the Magnet Mill Company to crush the ore of this Company. The shaft is 550 ft. in depth. At the 450-ft. level an incline was sunk to the depth of 100 ft. Drifting for the ledge from this point will probably be started during the coming week. About 5 tons of rich ore are being raised daily.

PARLAN.—This mine is situated in the northwest direction from the Court House, on the Highland road. Last Tuesday work was commenced, and the ledge now shows 2 ft. in width.

STANDARD.—Depth of shaft, 130 ft. A drift at this depth has been run on the ledge in a westerly direction 150 ft. The ledge is about a width of 10 ft., and assays average \$75 to the ton.

OCEAN BELL.—The principal work on this mine since our last review, is the timbering of the mine. The depth of the shaft is now 175 ft. Sinking will be re-

sumed during the coming week, and will continue to the depth of about 300 ft.

MARION.—The winze has been sunk 150 ft. on the ledge, which is well defined, with very favorable indications. Sinking continues.

MAZEPA.—Has proved itself to be equal to every expectation. The pulp assay of ore at the mill goes \$124.07 to the ton. Ore will be constantly shipped to the mill. The hoisting works will be put up shortly.

MONTANA.—The indications are looking favorable, and the prospects are that 30 ft. more will show up the ledge.

CHIEF EASTERN EXTENSION.—The principal work on this mine lately has been the timbering of the winze below the 90-ft. level. The work will be completed by to-morrow, when the work of sinking on the ledge will be resumed.

EXCELSIOR CHAMPION.—Still sinking at 220 ft., and no material change has shown itself since our last report.

CHARTER OAK.—On Thursday last the Charter Oak mine, one of the early locations of Ely District, made one of the richest strikes that has been made in the camp for a long time—a vein five feet in width that assays \$1,450 to the ton.

EXCELSIOR.—The Excelsior is constantly hoisting ore, and is turning out mill running night and day.

THE SUNBEAM.—Is showing a vein 3 ft. in width, assaying at an average of \$1,380 to the ton. The Portland and many other mines too numerous to mention, have their dumps loaded with first class ore, awaiting their turn for a crushing.

WASHOE.

SILVER HILL.—Gold Hill News, Dec. 28: The shaft is down 85 ft. The main drift is in 24 ft.

GOLD & CUREY.—Prospecting at the lower levels still goes steadily on, with no new developments or change of material interest to note. Sinking the incline is still progressing slowly, the rock working tough and hard.

SAVAGE.—Daily yield of ore 145 tons, worth \$27 per ton. The old ore-body in the upper works of the 661-ft. level, still holds out. The incline is down 104 ft. below the 1000-foot level, the sinking making excellent progress. The main south drift on the 600-foot level is still driven ahead. The main north drift on the 1000-ft. level, is also making much better headway.

CALABONIA.—The main north drift on the 400-ft. level from the new shaft, is pressed vigorously ahead. A cross-cut west from this drift has developed some very fine ore.

CHOLLAR P. ROSS.—Daily yield, 150 tons of ore, the assay value of which is \$32 per ton. Repeating the shaft is progressing slowly. The new Root boiler appears to be a perfect success.

HALE & NORCROSS.—But little ore has been extracted during the past week. The work in the mine has been mostly confined to excavating for the water-tanks and getting the pumps ready for operation. No new developments of interest to note.

EMERALD EXTENSION.—The new development or change of interest to note. The surface-work is being pushed to completion as fast as the material can be obtained.

CON. VIRGINIA.—The shaft is down 94 ft. below the 500-ft. level in good sinking ground. The main north drift, on the 1127-ft. level, is pushed steadily and vigorously ahead. The new hoisting works are about completed.

OVERMAN.—The head of water in the shaft continues very strong, though it is being slowly and steadily lowered by the unceasing use of the hoisting-tanks.

INSURANCE.—The incline is down 85 ft., the full size of the shaft still in good ore. The sinking has been greatly retarded during the week by a cave in the air-shaft.

SUNBEAM.—Daily yield, 150 tons of ore, worth \$27 per ton. Prospecting the 500-ft. level of the new shaft, goes steadily on. The ore producing stations in both the upper and middle portions of the mine are looking and yielding well.

MINT.—Sinking the shaft is making slow but steady progress. An assay of ore taken from the shaft during the week, assays \$42.20 silver, and \$60.80 gold, making a total of \$203 per ton.

BELOCHER.—Daily yield, about the same as last week, 320 tons. The winze between the 1,100 and 1,200-ft. levels, 200 ft. from the Crown Point line, is down 56 ft. The south drift at the 1,200-ft. level, is being driven ahead to connect with the station being opened in the main incline.

YELLOW JACKET.—Drifting and cross-cutting at the 1,300-ft. level north, progress as usual. Drifting east for the ledge at the 1,400-ft. level from the incline is resumed.

JULIA.—Repairing the broken machinery was finished and the rock in the shaft and drifts resumed last Monday. The work in the bottom of the shaft works well, and the sinking is making good progress. The main east drift on the 800-ft. level is in 250 ft., running through ledge matter that promises some fine developments.

SUOCON.—Shaft about 250 ft. in depth. Rock hard, but fair progress is made. The hoisting machinery is in an effective condition, and operates well. Enough water comes into the shaft to keep the pump going considerably.

BUCKEYE.—About 25 tons per day, enough to keep the Hope and Sherman mills running, is being extracted. No change in the mine since last report. The ore assays about \$13 per ton on the average, and there is plenty of it in sight.

ARIZONA AND UTAH.—The new machinery is working splendidly. Sinking the shaft was resumed last Wednesday, and everything in and about the mine is putting on a new look.

CROWN POINT.—The ore breasts at the 1,100 and 1,200-ft. levels are looking and yielding splendidly. The 1,300-ft. level opens out richer and richer, the face of the south drift being still in fine ore.

UTAH.—The north drift on the adit level is still pushed vigorously ahead with no developments of interest to chronicle. The hoisting new and new shafts are still standing idle for want of the supply of wood necessary to run them.

PROTOV.—The drift north from the shaft is in 70 ft., and making satisfactory progress in good working ground. The shaft is not being sunk deeper at present.

GLOBE.—The ore body being developed in the raise from the tunnel shows improvement, and the main west drift is progressing.

EXTORTION.—Nothing doing at the 1,100-ft. level although the water is drained out. The only work done is in the old workings between the 500 and 700-ft. levels.

JACOB LITTLE.—The storm has interfered somewhat with operations in the upper mine, but the ore still continues to improve.

OCCIDENTAL.—The main north drift is still driven steadily ahead by the contractors with no material change of interest to report.

BALTIMORE CONS.—Shaft 393 ft. deep. Drift at the 250-ft. level in 178 ft. Rock still hard in both places, but works well.

WOODVILLE.—Shaft still sinking with good progress. Nothing new to report different from what we had last week.

KNICKERBOCKER.—Main drift in 438 ft. from the shaft. Rock still hard, but good progress made.

SENATOR.—Still shut down for want of the necessary supply of wood.

Idaho.

MARGOANT.—Owyhee Advertiser, Dec. 21: This mine is yielding very rich rock. The richest ore that ever came out of this mine is now found on the 6th level. They are sinking a winze on a new chimney of ore, 104 ft. south of the shaft. The ledge, as they go down, looks well.

MINNESOTA.—This mine looks well. They are sinking a winze on the 4th level, 120 ft. south from the shaft. Out of this it is said, the richest rock that was ever seen in the camp is taken. Also sinking a winze 200 ft. north of the shaft on a ledge 28 inches wide.

EMPIRE.—100 men are employed, and the yield is about 35 tons of ore daily. The ledge is about 2½ ft. wide

14 men are constantly employed in assorting rock. The ore looks splendid—free gold and silver in sight.

GOLDEN CHARIOT.—This mine is 800 ft. deep. Rich strike on the 6th level; stopping in the 6th and 7th levels. The vein is from 18 to 24 in. wide. Employing about 25 men.

SOUTH CHARIOT.—The total depth of the mine is 561 ft. Stopping in the 1st level shows a high grade of ore. The vein is 24 ft. wide. The yield of the mine is principally gold.

INA ELLMORE.—Is now 750 ft. deep, employing at present about 40 men; yielding 12 tons of ore per day, which looks well.

Lower California.

SAN RAFAEL MINES.—Cor. San Diego Union: About two weeks since a new lead, giving evidence of great richness, was discovered. Two tons of the quartz were crushed in arrastras and yielded \$825. Of course this was selected ore; but it is thought that the rock of the lead, which will average from 3 to 4 ft. in thickness, will give at least \$125 per ton. The new mine has been named Apponattox. The Pueblo mine is being worked actively.

A shaft has been sunk to the depth of 45 ft. on the lead, and a tunnel has been opened out. Two tons of selected ore were crushed, from which \$349 worth of gold was obtained. It is the intention of the owners to sink two more shafts, one of them on to San Francisco, in order to make a thorough test. If it "pans out," as they expect it to, arrangements will be made at once to erect a mill on the lead. The lead is a very wide one, averaging fully 4½ ft. It is one of the oldest discoveries; \$10,000 were taken from one pocket in sinking the discovery shaft. The Castillo mine adjoins the Pueblo. It is being worked by its owner, who has a number of men in his employ. A tunnel has been run from the sidehill, 25 or 30 ft. in length, which taps the lead. The quartz all shows free gold, and the men are engaged in taking out small quantities, which are crushed in mortars; 45 to \$20 a day are obtained by this process. Mr. Castillo also contemplates forwarding a quantity of ore to San Francisco, and has in view a purchase of a mill. The Zapata mine is located on a splendid lead, has rich quartz, and will pay to work. The St. Nicholas is not being worked at present, and the McKean & Hoffmann mill, which is on the St. Nicholas lead, is also idle. Both mine and mill, it is expected, will be worked very soon.

There is some prospecting going on, principally by Mexicans. Some of the dry places are also being worked with tolerable success. Frequently the industrious workers are rewarded to the extent of \$4 or \$5 per day for their labor.

Utah.

SILVER PRODUCTION.—The production of silver from the mines of Utah for the year 1871 is roughly estimated at \$5,000,000, and a writer in the Omaha Herald predicts that the total yield for 1872 will reach double that amount. It is difficult, however, to arrive at an accurate estimate of the production in that Territory, as the shipments are made, some of them in refined silver bullion, others in base bullion of varying value, and others still in ores of widely different degrees of fineness. It is believed, though, that the Little Cottonwood District alone has yielded more than \$500,000 worth of silver this year. There are seven mines there, besides the Emma, yielding more than \$500,000 each, some reaching as high as \$1,400,000.

NEW MINING DIST.—Salt Lake Herald, Dec. 19: Drum Dist. is a new discovery, and lies about forty miles south of Tintio. Mr. Hooper, who discovered the district on the 5th inst., gives us the following particulars in regard to it:

He found a large ledge regularly outcropping for about a mile, which carried a large and rich lode of copper ore, specimens which Mr. Hooper acknowledges were selected, have been assayed since his return to town, and yielded as high as sixty per cent. of copper, and forty dollars in silver per ton. Nevertheless, from tests made the ore is of a high average quality, and the quantity of it is represented as enormous. The district is less than sixty miles from the U. S. R. R., and some timber and water are stated to be abundant for steam purposes.

DE SOTO.—The De Soto mine continues to yield rich ore. The ore-streak in the vein is from 3 to 5 ft. wide; 4 miners are employed, who extract from 1½ to 2 tons of ore per week, besides several tons of second-class ore. The first-class is worth on an average \$400 per ton, and is shipped to San Francisco. The second-class is piled on the dump, to await the completion of the concentrator.

STAR DIST.—The Krom Concentrator, building in Star District, on which a large force of mechanics has been engaged for some months, is inclosed. It is 70 ft. high, 40 ft. wide and 74 ft. long. One car load of the machinery has arrived, and is being placed in position in the building. The balance of the machinery weighing 49,000 pounds is expected at Mill City daily. Water is to be the motive power. A "hardy-gurdy" wheel, 8 ft. in diameter, running under pressure of 250 ft., is to be used. 1,300 ft. of heavy sheet-iron pipe, capable of resisting this pressure, manufactured by C. W. Purdin, of this town, has been laid to convey the water from the creek to the mill.

ELY DISTRICT BULLION.—The bullion shipments from Pioche for 1872 amounted to about \$5,359,409, showing an increase of nearly 50 per cent. over that of the previous year. An improvement is noticeable in nearly all the principle mines of the district.

THE SNOW SLIDE IN UTAH.—The accumulation of snow in Cottonwood cañon, Utah, is immense, and this year, as last, numerous slides have occurred. A heavy avalanche occurred there on the 26th ult., in which eleven men are said to have lost their lives.

TIMBER.—President Grant indorses the recommendation of the Commissioner of Agriculture, that in disposing of public lands, that one-tenth be reserved in timber where it exists, and that where it does not exist, inducements be offered for planting this proportion. It is probable that the bill before Congress will be amended in accordance with the President's suggestion. From experience on the frontier, and knowledge of the circumstances of settlers on the public lands, President Grant is able to estimate correctly the probable result of such Legislation. He knows exactly what the average settler can do, or will try to do.—Northern Enterprise.

THE PRODUCT OF THREE IRON FURNACES IN BOYD COUNTY, KY., yielded more profit to the owners last year than all the tobacco raised in Davies County, where that staple is largely raised, to all the producers of that weed combined.

"BABY RAILROADS" is an expressive Western phrase for narrow-gauges.

The Railways and their Mineral Traffic.

Were proof required of the remarkable degree of activity which has characterized the staple trade of the United Kingdom during the past six months, the dividends paid and payable to the shareholders of the principal lines of railway would be most conclusive. On some lines the increased dividends have not been so substantial as the shareholders anticipated, nor, perhaps, as they had the right to expect; but these lines were principally passenger lines, and the increased receipts were largely diminished by the extraordinary high price of coals and the general advance in the wages of those employed. The receipts upon the mineral mines have, however, been steadily increasing, and there can be no doubt that, properly developed and with the requisite facilities granted, the iron and coal trades prove the "back-bone" of the railway system. Statistics demonstrate that a line of railway running through a good mineral district, and having good ports of discharge, or leading to large "nests" of manufacturing, must pay; and railway directors but ill advance their own interests and those of the shareholders when they ignore the claims which the iron and coal trades have upon them. The Taff Vale Railway, a short mineral line in Wales, will always be cited as one of the best paying lines in the whole kingdom, with its 1001 shares worth some 140% or 150%, and paying its 10 per cent. dividend with a regularity quite enviable by other lines, besides laying up almost every half year a considerable sum as a reserve fund to provide for any unforeseen contingency. This line is not only one of the best paying lines in the kingdom, it is one of the best managed; its trains run with clock-like regularity, and the wants and requirements of the colliery proprietors, the ironmasters, and the traders generally are not only met, but studied and promoted. Gladly, too, we acknowledge that of late years, and under the able management of Sir Daniel Gooch, the Great Western is directing far more attention to the necessities of the colliery proprietors and promoting the interests of the traders than in years gone by; and, verily, the increased dividends and the extraction of the affairs of the company from the financial complications which once surrounded them is the reward.

The line, as is well known, runs through the very vitals of the Principality, while its many arteries lead to sources of wealth, which, if still promoted and fostered, will yield results in the shape of dividends, of which the most sanguine scarcely now venture to imagine. Can anyone doubt the expediency and policy of the Great Western in the last venture they made on behalf of the colliery proprietors and traders of Wales? Does not the last report of the directors conclusively prove the soundness, even financially considered, of the expenditure in laying down the narrow-gauge? The golden harvest is at hand, and the present dividend is the highest paid in very many years past. The London and North Western has also tasted the fruits of its connection with the colliery districts, and its traffic receipts show an enormous increase as compared with those of former years. The Midland is evidently so well satisfied with its alliance with the Hereford, Hay and Brecon system, that they naturally yearn for a closer connection, and seek powers which will give them access into the very interior of Wales. The Swansea Vale is an essentially mineral line, and for many years never paid a shilling dividend; but such is the wonderful expansion of the staple trades of the district that the last half year at least 5½ per cent. was legitimately earned. The Monmouth, the Neath and Brecon, the Llanelly, the Rhymney and other lines have all more or less shared in the prosperity of the iron and coal districts, and there is every proof, therefore, that the dividends of railways, if not altogether governed by, is at least greatly dependent upon the activity or otherwise of the staple trades of the country. The Welsh line has been principally cited in this article, because they afford the most striking illustration of the point we are endeavoring to prove and have ever maintained—that the interests of railway directors and shareholders, and those of colliery proprietors and iron makers are very closely allied; they go hand in hand together; and all the directors of our main or trunk lines would promote their own interests

if they would strain every nerve to develop the resources of new mineral districts and encourage the expansion of trade by every means in their power.

As far as can be ascertained, the mineral traffic passing over the railways of Great Britain and Ireland in 1871 amounted to 102,222,464 tons. To this total England and Wales contributed 81,412,357 tons; Scotland, 20,337,781 tons; and Ireland, 472,326 tons. The receipts derived from this traffic were 10,029,253½, to which England and Wales contributed 8,610,713½; Scotland, 1,360,513½; and Ireland; 58,027½.—*Exc.*

New Idria Quicksilver.

But few people are acquainted with the history of the discovery of the New Idria quicksilver mines, and some facts having come under our notice, we give them for the benefit of our readers. In 1856 a party prospecting for silver in the southwestern part of this country—the present location of the New Idria works—discovered a deposit of chromate of iron, which they supposed to be a silver deposit, and for some time worked it as such, before finding out their mistake. Here the party separated, some going one way and some another. Some of the party shortly after discovered cinnabar at the San Carlos mine, and at about the same time ore was found at the Idria mine, proper, in the company's grounds. Among the company's mines are the Idria, San Carlos, Aurora, Molino, Washington, Benada and Victorener. The largest amount of work has been done in the Idria mine, proper. San Carlos has produced well and been quite extensively worked. The San Carlos mine is several hundred feet higher than Mount Diablo, and is the highest point in the range except San Benito, (misnamed on the maps of California, being named Panoche Peak,) which is quite near. San Carlos is 4,977 feet high, and Mount Diablo 3,876, and San Benito Peak still higher than San Carlos. The workings consist of tunnels, with communications by shafts from level to level, to a depth of 600 feet. The company are now engaged in erecting machinery, probably the heaviest of its character in the State, for the purpose of sinking 500 or 600 feet lower. The new machinery is being put up at a point 1,000 feet under ground. In the Idria (proper) the underground work will probably measure four miles. The mine has been producing constantly since 1857. The process for reducing the ore consists of thoroughly roasting the ore in furnaces holding from 50 to 60 tons, and the vapors (quicksilver at a temperature above 50° of heat passing off in vapor,) condensed in large brick condensers, where it comes in contact with cold air. These condensers consist of a series of 12 to 16 large brick compartments, having a single opening in each wall, through which the smoke of the fuel and the vapors of the ore pass finding their way to the chimney, before reaching which the quicksilver is supposed to be precipitated, and the wood smoke finds its way out. The chimney alone is an institution worthy of note. It is built on the slope of the hill on which it rests, and is large enough to admit the passage of a man comfortably from top to bottom. The quicksilver rarely if ever reaches the top of the chimney. In no other part of the world has cinnabar, the common ore of quicksilver, been found so widely disseminated as in California. Outside of California, and until the California discoveries, the world had depended almost wholly upon the old Almaden, of Spain, and the Idria, of Austria, for this important requisite in the collection of its metallic wealth. The event of the California discoveries should be appreciated by every individual who uses a pound of quicksilver, for there are thousands of gold and silver mines that could never have been profitably worked but for these discoveries. Prof. Von Cotta, in his book on ore deposits, says, "That even platinum is not so equally distributed as this metal, and it may be asked how it happens that this metal is collected in such masses at some localities." "After platinum mercury is the rarest metal used in the arts and manufactures." The old Almaden quicksilver mines of Spain, it is well established, was worked seven hundred years before the Christian era, and is now still producing perhaps the largest amount of any in the world. Cases of salivation are frequent among the men engaged about the furnaces, caused by inhaling the mercurial vapors. In some portions of the reducing works the laborers receive one dollar per hour for their services. These men handle the ore in a heated state, and tie heavy bandages over their mouths and noses to prevent the inhalation of mercurial fumes, and even with this precaution they are frequently salivated. A visit to these mines will repay one amply for their trouble.—*Fresno Examiner.*

ENGLISH MANUFACTURERS LOOKING AMERICANWARDS.—Many English manufacturers, in view of the rapidly advancing prices of coal and labor in England, are looking to this country as a favorable place for re-locating their works—especially such as manufacture largely for this market. Mr. Coats, the celebrated English thread maker, has already moved his establishment to Pawtucket, R. I., where he employs three hundred persons.

The Tailor-bird.

Our own engraver has executed the accompanying cut, which enables us to illustrate an interesting fact and trait in the natural history of the Tailor-bird, which we find in the *Illustrated Monthly*.

"The ingenuity and skill displayed by many of the lower animals in the construction of their homes is so marked and marvellous, that we do not wonder that the enthusiastic naturalist should be led to believe that they are possessed of reasoning faculties similar to man's. The spider's web, the beaver's dam, and, more remarkable than either of these, the endless varieties of bird's nests, all tend to prove that what we call the *instinct* of animals is as mysterious a mental quality as the *reason* of man.

The illustration here given represents the leafy nest of the Southern Tailor-bird; and, if it appears more wonderful in its construction than the queer little mud cabins of the barn-swallow or the swinging nest of the oriole, it is only that by its resemblance to the work of the human hand we are the better able to compre-

THE TAILOR-BIRD'S NEST.

hend the difficulties attending its construction.

With only its beak and claws, this expert little artisan obtains from some vine or sallows bark the long thread with which the edges of the leaf are stitched together; and, as the nest is located at the end of a long swinging branch, the sewing must be done by the beak alone, as the claws are needed to grasp the limb above; and yet this is only half the work, for, after the leafy shell is finished, it must be lined with a closely-woven and braided cushion, that the eggs and young may be safely housed.

It is not difficult for us to understand how a child, under the guidance and direction of its parent, may at last succeed in producing a work as perfect in design and finish as that which served as a pattern; he sees where the first attempt was wrong, and improves upon it in the second. But not so with the young Tailor-bird. No sooner is it able to fly than it leaves the nest, of which it has seen only the interior, and with no lesson or advice, at once seeks a mate no wiser than itself; and together they two build a new nest, so perfect in finish, and similar in design to the one they had left, that it is hard to believe that the old home was not transported to a new branch. The child had *reason*; the bird, *instinct*."

CHEAPER SEWING MACHINES.—There appears to be a prospect that the price of sewing machines will be reduced. The patent for the Wheeler & Wilson machine will shortly expire. During the last session of Congress there were several unsuccessful efforts made to have it extended, and the application for an extension is still before the Senate Committee on Patents, with little prospect of its being reported this Winter. In case the application for an extension is defeated, it is thought the price of sewing machines will be brought down to \$20 or \$25. In the testimony filed before the Committee, given by skilled machinists, it is stated that the average cost of manufacturing sewing machines is \$7 to \$12. This patent is owned by what is known as the sewing machine combination, but the application for extension of the patent is in the name of A. B. Wilson. Many of the smaller machine companies oppose the extension. There are, before the Committee, petitions signed by over twenty thousand persons, many of whom have from one to twenty machines in operation in manufacturing establishments, asking that the extension be refused. The old companies have made millions upon millions upon their patents, and it is now time that their monopolies should be done away with, and the public benefitted by throwing the business of making and selling machines open to competition. The question seems hardly to admit of argument.—*Call.*

THE SIGNAL SERVICE AND THE FISHERIES.—General Myer, the head of the United States Signal Service, has intimated his desire to promote the interests of fishermen through the operations of his department, as we learn from the Gloucester Telegraph, by establishing stations which shall not only notify the fishermen of changes in the weather, but also of the movements of fish, such as mackerel, herring, etc., alongshore. The idea seems to be an excellent one.

Silver and Silver Coinage.

In the annual report of the Secretary of the Treasury, says the *Territorial Enterprise*, it is suggested that general silver coinage be suspended throughout the United States, owing to the depreciation in the value of silver compared with gold, and that silver dollars alone be coined hereafter—the piece to correspond in weight and fineness to the Mexican dollar, which is largely used, and at a premium, in our trade with China and Japan. During the past ten years the value of silver in relation to gold has decreased three per cent. To what extent this depreciation is due to the silver product of Nevada, we are not advised; but it is remarkable that the decline commenced with the opening of the Comstock mines, and has steadily gone down with the increased yield of this great deposit. It is a curious fact that when the great gold discoveries of twenty years ago were made economists like Cobden and Chevalier thought that silver would replace gold as the standard money of the world. Holland acted upon the theory, and made silver the sole standard currency.

Now, on the other hand, gold has beaten silver out of the field, so that—with the exception of Holland—no country places silver on equality even with gold as money. Silver is now quoted at lower rates in the English markets, according to the *London Economist*, than it has been for twenty years. "Ten years ago," says the writer, "the price was 62½d. per ounce standard; a year ago it was 61d.; it now is 59½d." The Secretary of the Treasury attributes the decline of the past year to certain changes in the standard money of Germany. So, also, does the *Economist*. It directs attention to the fact that, before the late changes, silver was in all the States of Germany the sole legal tender; gold was only an article of merchandise; the greater part of the circulation is consequently silver. But, by the recent law of the new empire, gold is already a legal tender as well as silver. Before long, according to the announced policy of the Imperial Government, it will supersede silver. Instead of there being various silver standards, as until lately, in the several States throughout Germany, there will be one imperial gold standard. In consequence no one likes to keep much silver; every individual and still more every bank, tries to "pass on" that metal; every one sees that silver will soon be demonetized; that every one who holds a large stock of it when it is demonetized will be a heavy loser. "All Germany," says the *Economist*, "which has now principally a silver currency, is before long to have principally a gold currency. Now Germany is a country of great extent, great trade, and great wealth, and a country where banking is but little developed, and where the percentage, so to speak, of coin to wealth is, if measured by an English standard, enormous.

To change the main actual "coin," of such a country from one metal to another, will cause a permanent use, on a large scale, of the metal which is chosen, and a temporary setting free on a large scale also, of the metal which is abandoned." The late decline in the price of silver may be due, as assumed by Secretary Boutwell, to the action of Germany; but the depreciation of the preceding nine years must be traced to another cause. What can this cause have been but an increased yield of silver? Until 1860 but little silver was produced in the United States. Since that time, Nevada, Colorado, Idaho and Montana have given to the world silver to the value of about \$150,000,000, while the gold yields of California and Australia have decreased yearly. As the product of silver has increased during the past ten years while the gold product has decreased, it is but natural that the relative value of the two metals in the money markets of the world should have been correspondingly affected. But the mine-owners of Nevada need not be alarmed. Silver will always be a marketable commodity, even should it be used somewhat less in coinage. Although Nevada will turn out nearly one thousand tons of silver bullion next year, it will produce an amount of gold but a fraction less in value, and it is probable that the relative value of gold and silver will not change materially for many years to come.

I. L. D.—Under the above peculiar heading the *Carson Appeal* gives the following item: We were allowed by Mr. Whitehill, State Mineralogist, at our earnest solicitation, to publish the following item of his travels through Southern Nevada on his exploring tour in the Summer of last year. Near the summit of the Clarke mountains, in the Kingdon range, on its eastern slope, there is a limestone cliff with smooth surface, almost perpendicular, and 250 feet in height. About 100 feet from the base of the cliff, on its front, are engraved the above characters of immense size, 60 feet high and 2½ deep which may be seen at a great distance. There is no tradition respecting these characters. The crosses and the Roman letters seem, however, to argue the workmanship of Jesuit missionaries. A mission was established at the mouth of the Gila river in 1633, and also at various points in New Mexico, by Eusebius Kino. There is also an old map extant representing forty towns and villages in Arizona. Probably the letters were made by the followers of the good priests while making some settlements in the vicinity, in their endeavors to Christianize the Indians; or while passing by on a tour to California, where permanent missions had been established.

USEFUL INFORMATION.

How to Varnish.

Varnishing should always be done in a warm atmosphere 72 deg., or as warm as you can comfortably work in. In a reduced atmosphere water is always present, an invisible dew, and will give to varnish a milky and clouded appearance, even on a fine summer day this may happen, and the only way to obviate the difficulty is to heat to 72 degs., sufficient to keep the moisture suspended in the air until the solvent has entirely evaporated leaving the gums in a thin glossy coat; the brilliancy and defensive value of the varnish will depend upon this.

To produce a brilliant surface have your work in the varnish room a few hours before varnishing that it may acquire the same temperature as the atmosphere. Smooth the surface, wash off and wipe dry with a camels skin or piece of old silk, removing all traces of dust, moisture or grease—no oil or grease should be allowed or used—have your brush as large as the nature of the work will admit—soft, clean and free from loose hair. Lift the varnish lightly with the brush, charging moderately, and apply a thin coat. Begin at a little distance from the edge or at the inside of the panel, highest point first, and work to the outside edge in direct, long, rapid, and steady strokes with a moderate pressure, sparingly upon the edges and angles, working alternately toward the ends; spread evenly and quickly the thickness of paper and draw lightly for finish, in this great care and watchfulness are required.

After varnishing expose your work to the heat of the sun or keep in heat free from dust and draught. Cold air and draught passing over varnish will dull the surface wherever they extend. If the varnish should so become chilled, the brilliancy and clearness may be restored by giving the surface another thin coat, and immediately hold near the fire to dissolve the chilled coat but not too near to blister.

THE WATER TELESCOPE.—For seeing under water, consist of a tube to enable a person looking over the gunwale of a boat to rest the head on one end, while the other is below the surface of the water; the upper end being so formed that the head may rest on it, both eyes seeing freely into the tube. Into the lower end is fixed (water-tight) a plate of glass, which, when used, is to be kept under the surface of the water; so that the spectator, looking down the tube, sees all objects at the bottom whose reflective powers are able to send off rays of sufficient intensity to be impressed on the retina, after entering the loss of light caused by the absorbing power of the water. Light in passing through pure sea-water, loses half its intensity for each 15 feet through which it passes, says Sir John Leslie. In clear water the bottom may thus be seen at the depth of twelve fathoms. This contrivance is much used in scuba diving along the northern and western islands of Great Britain, where, sometimes in the form of an ordinary washing-tub with a piece of glass fixed in its bottom, the shot seal is looked for, and the grappling-hook let down to bring him to the surface. The Norwegian fisherman also often use this telescope when their anchors get into foul ground, or their cables warped on a roadstead.

MOTION OF THE EYE.—On coming into a room, we think we see the whole side of it at once—the pictures, the cornice, the chairs—but we are deceived; being unconscious of the Motions of the Eye, and that each object is rapidly, but successively, presented to it. It is easy to show that if the eye were steady, vision would be quickly lost; that all those objects which are distinct and brilliant, are so from the motion of the eye; that they would disappear if it were otherwise. For example, let us fix the eye on one point—a thing difficult to do, owing to the very disposition to motion in the eye. When we have done so, we shall find that the whole scene becomes more and more obscure, and finally vanishes. If we then change the direction of the eye but ever so little, at once the whole scene will be again perfect before us. These phenomena are consequent upon the retina being subject to exhaustion, by the lights, shades, and colors of objects continuing to strike upon the same relative parts, and thus exhausting the nerve; but when the eye shifts, there is a new exercise of the nerve.

CULTIVATE HABITS OF CAREFUL OBSERVATION.—Prof. Buckland in a late address asked his audience, which he supposed contained young men who one day would be among the rulers and chief men of our land—to see for themselves, to hear all they could, but not accept as gospel what they heard till they had proved it. He wished to encourage a habit of examination and inquiry among young and old, and gave amusing instances of attempts that had been made to impose on himself. A "monster," said to have been shot in the woods of Japan, was brought to him, and a large sum asked for it. A hideous wretch it was when produced, but he soon discovered that it was made of gutta serena, and was ingeniously fitted with eyes, teeth, nails etc., from various incongruous animals.

USEFUL IF EFFECTIVE.—A citizen of Bedford county, Va., has invented a machine to melt the snow and ice on a railroad track as the train runs, by means of a flame of efficient intensity to produce the result instantly. The invention is just in time, if effective.

POWER OF THE EYE IN VIEWING MINUTE OBJECTS.—The smallest particle of a white substance distinguishable by the naked eye upon a black ground, or of a black substance upon a white ground, is about the 1-400th of an inch square. It is possible, by the closest attention, and by the most favorable direction of light, to recognize particles that are only 1-540th of an inch square; but without sharpness or certainty. But particles which strongly reflect light may be distinctly seen, when not half the size of the least of the foregoing; thus, gold dust of the fineness of 1-1125th of an inch may be discerned with the naked eye in common daylight. When particles that cannot be distinguished by themselves with the naked eye, are placed in a row, they become visible; and hence the delicacy of vision is greater for lines than for single particles. Thus, opaque threads of no more than 1-4900th of an inch across, or about half the diameter of the silkworm's fibre, may be discerned with the naked eye when they are held towards the light.—CARPENTER'S *Animal Physiology*.

BOGUS CHINESE PEARLS.—Minute descriptions have been written of the manner in which the Chinese claim that they obtain real pearls by placing foreign substances within the shell of the fish which produces pearls, when the animal, unable to get rid of it, makes a deposit of "pearl" matter around it, so that it becomes a real pearl. Professor Buckland has recently shown that this is possibly a deception which has been quite successfully practiced upon the "outside barbarians." During a recent lecture he exhibited a large pearl shell in which were seven or eight images of the God Buddha, coated with a secretion of mother of pearl.

The professor said it was claimed by the person who presented the shell that the oyster deposits this secretion itself, when Master John Chinaman inserts these images. Mr. Buckland was sceptical, but said nothing till he had proved that the secretion was as much artificial as the little images themselves. It was a solution of the real mother of pearl, artificially applied and painted over the images.

HOW THE DIAMOND CUTS GLASS.—Dr. Wallaston ascertained that the parts of the glass to which the diamond is applied are forced asunder, as by a wedge, to a most minute distance, without being removed; so that a superficial continuous crack is made from one end of the intended cut to the other. After this, any small force applied to one extremity is sufficient to extend this crack through all the whole substance and across the glass; for since the strain at each instant in the progress of the crack is confined nearly to a mathematical point at the bottom of the fissure, the effort necessary for carrying it through is proportionally small. Dr. Wallaston found by trial that the cut caused by the mere passage of the diamond need not penetrate so much as the two-hundredth part of an inch. He found also that other mineral bodies, recently ground into the same form, are capable of cutting glass; but they cannot long retain that power, from want of the requisite hardness.

FORCE OF LIGHTNING.—In August, 1846, St. George's church, at Leicester, England, was entirely destroyed by the effects of a thunder-storm! The steeple was hurst asunder, and parts of it were blown thirty feet; while the vane-rod and top part of the spire fell perpendicularly down, carrying with it every floor in the tower. Mr. Highton, in comparing the power of this discharge of lightning with some known mechanical force, states, that one hundred tons of stone were blown a distance of thirty feet in three seconds; consequently a 12,220 horse-power engine would have been required to resist the effects of this single flash.

SUBSTANCES THAT MOST RESIST THE ACTION OF COLD.—Pure alcohol, ether, bisulphide of carbon, and glycerine do not freeze at any temperature to which they have ever yet been subjected. Ammonia freezes at about 45° below Fah. zero, and pure nitric acid at about the same point. Mercury freezes at -39° Fah., sulphuric acid and some other substances require also a temperature far below the zero of Fahrenheit scale to produce solidification. The union of any liquid, which by itself remains fluid at a very low temperature, with water, will raise its freezing point.

THE PILOT FISH.—That little fellow, crossed with blue stripes, that is said to pilot the shark to its prey is really no pilot at all. The idea is a delusion. He is no more a pilot to a shark than the starling is to the sheep. Do we think the starling is in love with the sheep that it settles on its back? No; it is then busily ridding the sheep of its natural tormentors—its Norfolk Howards. Such an office does the so-called pilot fish fill in regard to the shark.

UTILIZING COTTON WASTE.—The experiment at Westville, Conn., of a factory for the extracting of oil from cotton waste has proved a decided success. By this process old grimy, greasy rags and waste cotton are rendered perfectly pure, odorless and merchantable. The waste of the Connecticut and Massachusetts cotton mills will more than supply the Westville Oil Extracting Works with materials.

NEW USE FOR MICA. A new use has been found for mica. It is now attracting public attention as a material for roofing buildings, for which purpose it has been found to be peculiarly adapted.

GOOD HEALTH.

The Blood.

Blood, in its ordinary condition, is always fluid; withdrawn from the vessels of the living animal and left for a time to itself, it separates into two portions, a semi-solid mass, and a liquid portion, in which the mass floats; the solid part is called the clot. This phenomenon (the formation of the clot) is due to the presence of fibrine in the blood; it is held in solution in the serum during life; but when this loses its influence over it, it solidifies, enclosing with it the globules; and thus forming the red gelatinous mass called the clot.

Blood is the special agent of nutrition, and is the general restorer of what is lost. But in addition it is proved, by simple experiments in blood-letting, and of transfusion, to form an essential stimulus for the performance of the functions of life. By severe loss of blood we become enfeebled and seemingly dead; but, if, before this happens, the blood of another animal be transfused into the veins of the suffering individual, the vitality is restored.

The importance of the globules is also proved by the same experiment; for if simple serum be so transfused, death takes place. The fibrine of the blood also plays an important part; for when the blood is deprived of its fibrine and injected into the veins of a dog, the animal dies with symptoms resembling those of putrid liver. The influence of the blood over nutrition may also be readily demonstrated. Withdraw the blood more or less from an organ, and it gradually wastes away in proportion to the quantity withdrawn, while, on the contrary, the greater size of the muscles in those who employ them actively, and hence draw to them a larger amount of blood. To the important functions and uses of the blood, some physiologists go so far as to assert that "the life is blood," in that the entire principle of life exists in the blood.

A morbid condition of the blood is the fruitful source of many diseases. Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions or sores; cleanse it when you find it is obstructed and sluggish in your veins; cleanse it whenever it is foul. Keep the blood healthy and all is well; but with this vital fluid diseased, there can be no lasting health.

POISONOUS CONFECTIONERY.—If a report just presented to the Newcastle (England) town council had been available at the time Christiana Edmunds was on her trial, it might have been found useful in support of the theory of her lunacy. No one but a lunatic, it might have been urged, would take the trouble to poison confectionery and thereby incur suspicion, where there are, ready-made to hand and openly sold in shops, sweetmeats artistically coated with deadly poison. That such is the case in Newcastle-upon-Tyne, is shown by a report of Mr. Pattinson, analytical chemist, upon which the local corporation have decided to take immediate action. Mr. Pattinson says he has examined various samples of sugar confectionery sold in Newcastle, and finds that nearly the whole of the articles colored yellow and orange are so colored by chromate of lead. Out of thirty-five different kinds of sweetmeats examined, obtained from twenty different dealers, twenty-eight were colored by this poison. Some of the articles contained upwards of a tenth of a grain of metallic lead, the engaging substance being supplied to manufacturers under the names of "lemon chrome" and "orange chrome." Mr. Pattinson adds that "Some of the confectionery contained plaster of Paris to the extent of 1 1/2 per cent., besides a good deal of wheaten flour." If parents were allowed their choice, they would doubtless prefer this last named adulteration to the lead salt mentioned above.

MECHANISM OF THE BONES.—In the human skeleton there are commonly enumerated 260 bones, which present every variety of size and figure. But all these varieties may be reduced to three classes: the long and round, as the bones of the upper extremities; the broad and flat, as the bones of the skull; or the short and square, as the separate bones that compose the vertebral column. The long bones are adapted for motion, the flat for protection, and the square for motion combined with strength. Accordingly, the long bones are moulded into lengthened cylinders, and form so many levers, exquisitely constructed and combined. In the employment of the flat bones for the covering of some of the more tender and delicate organs, as the brain and spinal cord, the form of these bones adds to their strength, as in the vaulted roof of the skull; while in the construction of the vertebral column, composed of the short and square bones, which are so adjusted, as to afford a limited range of motion with a great degree of strength, so many and such opposite purposes are effected by means so simple yet so efficient, that no fabric constructed by human ingenuity approaches the perfection of this admirable piece of mechanism.

AN INTELLIGENT DRUGGIST.—It is said a Syracuse druggist recently received the following prescription, with a request to put it up:—Fix kramps—Tinct kamfire, won ounce; tinct lode-num, a little tinct hot drops, a few drops; tinct kyan peap, five cents worth; klonform a little, but not much, as it is dangerous medicine. Dose, half-teaspoonful when the kramps come on.

Nourishment in Food.

The wholesome or unwholesome character of any aliment depends, in a great measure, on the state of the digestive organs, in any given case. Sometimes, a particular kind of food is called wholesome because it produced a beneficial effect of a particular character on the system of an individual. In this case, however, it is to be considered as a medicine, and can be called wholesome only for those whose systems are in the same condition. Very often a simple aliment is made indigestible by artificial cookery. Aliments abounding in fat are unwholesome, because fat resists the operation of the gastric juice. The addition of too much spice makes many an innocent aliment injurious, because spices resist the action of the digestive organs, and produce an irritation of particular parts of the system.

In any given case, the digestive power of the individual is to be considered, in order to determine whether a particular aliment is wholesome or not. In general, we can only say, that aliment is healthy which is easily soluble, and is suited to the power of digestion of the individual; and, in order to render the aliment perfect, the nutritious parts must be mixed up with a certain quantity of innocent substance affording no nourishment, to fill the stomach; because there is no doubt that many persons injure their health by taking too much nutritious food. In this case, the nutritious parts, which cannot be dissolved, act precisely like food which is, in itself, indigestible.

It is a very mistaken idea that the nourishment in food is according to the quantity; a person may eat a great deal of some articles, and receive very little nourishment from them. The quantity of nourishment depends greatly on the aromatic flavor contained in food; and whatever is insipid to the taste is of little service to the stomach. Now, the difference between good cookery and bad cookery lies principally in the development of the flavor of our food; articles properly cooked yield the whole of it; by good cookery we make the most of every thing—by bad cookery, the least.

POWER OF MAN TO ENDURE COLD.—One who took part in a telegraphic expedition in Siberia writes as follows:—"I didn't believe that it would be possible for me to lie out in the snow, without shelter, in a temperature of even 20 deg. below zero, but I have done it once in 50 deg. below, and repeatedly in 45 deg. One of Bush's parties, in February of last year, passed the night on an open, barren steppe, with their spirit thermometer standing 78 deg. below zero, or 100 below the freezing point. Quicksilver they molded into solid bullets with four minutes' exposure to the air. It is true they did not dare to go to sleep that night, but I believe that, had they been properly fitted out with heavy furs and wolf-skin sleeping bags to tie over the head, they might have done it with perfect safety.

"I'm afraid you would think that I was availing myself of a traveler's privilege, and relating a very large 'yarn,' if I told you how comfortably I have slept on the snow in a temperature of 30 deg., 40 deg. and 45 deg. below. We are obliged to sleep in fur bags, of course, with our faces entirely covered, to take the utmost care to have our fur stockings perfectly dry; but I have slept in that way through the long Arctic nights as comfortably as ever I did in bed at home."

THE ART OF WALKING.—In a graceful human step, the heel is always raised before the foot is lifted from the ground, as if the foot were part of a wheel rolling forward; and the weight of the body supported by the muscles of the calf of the leg, rests for the time on the fore part of the foot and toes. There is then a bending of the foot in a certain degree. But where strong wooden shoes are used, or any shoe so stiff that it will not yield and allow this bending of the foot, the heel is not raised at all until the whole foot rises with it; so that the muscles of the calf are scarcely used, and, in consequence soon dwindle in size, and almost disappear. For the same reason in Paris where the streets have (few or) no side-pavements, and the ladies have to walk almost constantly on tiptoe, the great action of the muscles of the calf has given a conformation of the leg and foot, to match which the Parisian belles proudly challenge all the world—not aware, probably, that it is a defect in their city to which the peculiarity of their form is in part owing.

BISULPHIDE OF CARBON ON THE SYSTEM.—This substance is a deadly poison. Its vapor when inhaled converts the iron of the blood into sulphide of iron, causing death. It is a very volatile liquid; and its manufacture is quite dangerous from the above mentioned reasons. A vessel of it placed in a close room would cause death about as rapidly as carbonic acid or charcoal fumes. A cup full of the bisulphide placed in a tight apartment filled with grain will in a few hours kill not only every weevil but also its larva and eggs. It is a very useful substance, but at the same time, under certain conditions, an extremely dangerous one.

A correspondent of the *Scientific American* calls attention to the danger to be apprehended from the efforts now being made to free it from its very disagreeable smell, and says:—"What on earth people want to smell bisulphide of carbon for, I cannot understand. The more disagreeably it smells the better, for thereby some warning is given of its presence."

W. B. EWER..... SENIOR EDITOR.

DEWEY & CO., Publishers.

GENERAL EDITORIALS.—The Coming Exposition; A Monster Casting; A New Volume, 1. California Art Gallery; Smelting on the Pacific Coast; Cheap Coal. 8. ILLUSTRATIONS.—The First Quartz Mill in California, 1. The Tailor-Bird's Nest, 6. Hendee's Patent Gun Lock; The American Bottle Filler, 9.

MECHANICAL PROGRESS.—Bessemer's Steady Ship Saloon; Resistance of Building Stone to Heat, 3. **SCIENTIFIC PROGRESS.**—Experiments in Nature's Laboratory; Nickel as a Gas Occluder; Heating Water Above the Boiling Point in Open Vessels; Origin of Storms; Gummata of Iron Paper; There is no Object Unworthy of Our Notice, 3.

USEFUL INFORMATION.—How to Varnish; The Water Telescope; Motion of the Eye; Cultivate Habits of Careful Observation; Power of the Eye in Viewing Minute Objects; Bogus Chinese Pearls; How the Diamond Cuts Glass; Force of Lightning; Substances that Most Resist the Action of Cold; The Pilot Fish, 7.

GOOD HEALTH.—The Blood; Poisonous Confectionery; Mechanism of the Bones; An Intelligent Druggist; Nourishment in Food; Power of Man to Erase Cold; The Art of Walking; Bisulphide of Carbon on the System, 7.

MINING SUMMARY from various counties in California. Lower California, Nevada, Idaho and Utah, 4-6. Market Reports, 12.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 4.

MISCELLANEOUS.—Practical Uses of Geology; Klamath River Mines; Mining for Tin; Another Ancient City; Street Car Tracks; The Reported Chicago Grain Frauds; The Lake Superior Tin Discoveries, 2. The Railways and their Mineral Traffic; New Idria Quicksilver; Cheaper Sewing Machines; Silver and Silver Coins; I. T. D. Coal and Quicksilver; Frozen Up; Delays of Law—Courts of Conciliation; Shell Mounds on the California Coast; Co-Operation in Great Britain; What is Slate, and How was it Formed; The Bessemer Saloon Steamboat The Discovery of Petroleum in Pennsylvania; Nevada Salt and Soda Beds; Virginia Gold Mine; Superior Lake Railroad Iron, 10. New Code Mining Law, 12. New Incorporations, 16.

CALIFORNIA ART GALLERY.—The first number of which is before us, is devoted to music, drama, art and literature, and is published by Alfred Chaigneau & Co., 409 Washington street. Terms, \$5 per year. It is a very fine specimen of typography; the "heading" in particular is worthy of mention, having been made by the zincograph process, by the publishers themselves. The number contains "Mrs. Plattsware's Campaign," "Art in California," "Free Art Galleries," A sketch of Thomas Nast, a poem by J. F. Bowman and one by Chas. Warren Stoddard. "The Art Exhibition and the Gsrome," "Jottings at a Window," Local Art Notes, The Yosemite Waltz, (Music), "Is Joaquin Miller a Poet?" "Roman Recollections," "Unknown Benefactors," "Pauline Lucas Debut," Tales from the Greenroom, etc.

The zinc-chrome which accompanies the paper, is made by a new and peculiar process, a fact which our contemporaries seem to have overlooked. Too much has been expected from this first attempt, and the manner in which it is made, has not been taken in consideration. We will not attempt to criticize the skill of the artist who drew the picture, but think that in this style of printing they have done very well and made a fair beginning. The work is done by ordinary letter press printing and not by the slow and expensive process of lithography. This process is ten times as rapid and is correspondingly cheaper than regular chromo-lithography. The zincography done by this process would do credit to any journal in the United States. This manner of making and printing the picture is not generally understood, but when it is the excellence of the work will be appreciated. We look forward in future numbers to an improvement, and think they will make satisfactory progress in this new art.

Smelting on the Pacific Coast—No. 2.

A Few Hints on Making Smelting a Financial Success.

In our last issue we gave a short history of the business of smelting on this coast, its successes and failures. In this, we shall try to give a general view of the operations to be gone through with in smelting the argentiferous galena and lead ores of this coast, as well as a few hints that may assist those who propose engaging in it as a business, to avoid the errors into which others have fallen.

Of course no operation can be regarded as successful as a business

Unless it is profitable in a financial point of view, and consequently it often requires some close figuring in order to determine whether the enterprise will pay, though every facility for smelting may be obtainable and the character of the ore may be such as to make it susceptible of reduction by this process.

We shall first proceed to give the elements necessary for the success of the operation as a reducing process, and then some of the points to be observed in figuring the cost of production and the chance for profits. Of course, the first question to be answered before engaging in the erection of furnaces is, whether the

Ores to be Worked

Are susceptible of complete and satisfactory reduction by smelting. This may be answered by stating that at least in the ore should be contained 30 per cent. of metallic lead, though the greater the quantity of lead contained, the easier will be the operation, other things being equal. If the ores contain as high as forty per cent. or over, further advantages is found in the possibility of mixing in the smelt a small proportion of rich silver milling ore, if obtainable, and thus giving the bullion a higher percentage of silver.

In regard to the presence of other base metals than lead, in the ore, we would say that as a rule, they are deleterious not only to the smelting but to the appearance and value of the bullion produced. Antimony in small quantities is not, as a rule, very injurious, as it passes off in great part in the furnace, carrying with it, however, some portion of the silver. Copper in small quantities gives the bullion a hard nature and dark appearance.

Arsenic goes off in fumes, leaving a very small percentage in the bullion, but has the disadvantage of being very injurious to the workmen. These are the three metals most generally found in the argentiferous lead ores of this coast.

Self-Fluxing Ores.

The next thing to be determined is whether the ore is self-fluxing i. e. whether the matrix is sufficiently fusible at ordinary furnace temperature to liquify the whole mass. 2d, whether there is enough oxides and metallic iron in it to thoroughly reduce the lead to metallic form, when in contact with the charcoal of the furnace. This can be most easily determined by a small blast furnace which should always be attached to the works, its construction is but a trifling expense, and the convenience of one is very great; a single twyer is only necessary and the results are always of a practical character, and though chemical analysis of the ores are sometimes necessary to show what their properties are, and what they lack, in case the small furnace shows them to be not self-fluxing, this furnace obviates their use to a great extent.

In case the ore is not easily fusible, it may be made so by the addition of hematite (red oxide of iron) found generally all over the Pacific coast, which being easily melted and holding heat well, generally effects the desirable object, besides being also of value in another manner to be described hereafter; or sometimes the addition of salt or alkali will effect the desired object. In case the

Ore is Not Self-Reducing

That is, does not contain oxide enough to reduce the lead in the ore to metallic form in conjunction with the charcoal of the furnace, it may be made so either by roasting the galena so as to oxidize the ore, or by partly oxidizing the ore and then adding the hematite or metallic scrap iron to form with the excess of sulphur in the ore, sulphide of iron, which is carried off in the slag.

We will next try and form an idea as to whether the operation will be successful

In a Financial Point of View.

Of course this depends so much on the particular circumstances governing each case that only some general rules to be considered, can be given; 1st, other things being equal, it is always more economical to run several furnaces, than one; 2d, a loss of 5 to 10 per cent. must be expected on both lead and silver from assay results. The more silver and gold in the bullion the greater percentage can be obtained the cost of refining being no greater for bullion containing 500 ozs. of silver per ton, than bullion containing 100 ozs. per ton. In regard to running expenses, it takes from 20 to 40 bushels of ordinary charcoal to smelt

one ton of lead ore; on an average 30 bushels might be calculated. In making calculations the following must be regarded as outlay.

Cost of ore extraction; cost of transportation to works; cost of crushing; cost of fluxes; cost of bullion transportation to market; wear and tear of works; cost of charcoal, 30 bushels per ton; cost of three sets of hands, three each set for each fifteen ton blast furnace, i. e., one feeder, 1 smelter and 1 helper; 2 engineers, at 12 hour shifts; cost of wood for engine; one blacksmith for sharpening bars, etc. Against amount of bullion less ten per cent. on average assay, at from \$1 per oz. silver to \$1.20, according to amount of ozs. per 2,000 lbs., also 4½ to 5 cents a pound for lead.

This estimate is for 15 ton blast furnaces, the most economical in our estimation. They ought to have an inside diameter of 22 to 24 inches, with 12 to 15 feet fall from feed hold to twyers, a single front, two side and back twyers, or two back and two side twyers, and with blast direct into furnaces. Arched sides to enable burnt out stones to be removed; single tap hole and slag spout. This furnace, with 48 inches hearth, will smelt 15 tons of material a day; that is 12 tons of lead ore, 3 tons of iron ore (flux), lead slags and rich silver ore, etc., and properly managed, will do it well. In regard to the actual

Working of Such a Furnace

We do not pretend to attempt to give any general rules except this advice. To obtain some one thoroughly and practically acquainted with it as superintendent, and man that know their business to act under him, and be assured that they will save much money, anxiety and vexation, even if the salaries paid are higher. The following hints may be useful. In building the furnaces, the spaces between the furnace and the lining should be filled with fire sand, to fill any cracks that may be made in the lining. After being built the furnaces should have full time to dry; water lined twyers are most economical. In starting the furnace great care should be taken to heat it very thoroughly, but gradually. For a number of days a very light fire should be kept in it, and 24 hours before charging the fire should be kept at full force, the blast from the twyers being as strong as when the ore is being melted. A metallic bottom should be obtained for the furnace, if possible, by putting a ton or so of lead or bullion in the bottom. This keeps the bottom covered with molten metal and prevents freezing below the twyers. Half charges should be put into the furnace for the first 12 hours, after that, if everything is right, full charges may be made.

In charging, care should always be taken to charge in the centre of the furnace, or otherwise too much work will be given to some particular twyer; unless, in order to cool some particular portion of the furnace that shows signs of getting too hot and burning out, you charge over that particular point.

We consider it a matter of little importance whether one bushel of charcoal and small charges of ore are put into the furnace, or two bushels of coal and double the quantity of ore is used to each charge; though in large furnaces we are inclined to think the latter the preferable plan.

In Preparing the Ore

For furnace reduction, if it is found necessary to roast it, it can be done in kilns, cut into the sides of a hill and the wood and ore properly arranged to carry a draught of air through the mass; the sulphur of the ore will generally furnish a great portion of the fuel needed, thus making the operation comparatively inexpensive. Before going into the furnace the ore should be broken into pieces the size of hens' eggs, which permits the draught to pass readily through and the heat to penetrate and melt it rapidly. Great care should always be taken to

Keep the Furnace Free

So that the blast passes easily through the ore; this is perhaps the most important point in furnace management. As long as the fumes from the furnace are solid and dense and pour out regularly, the slag liquid, and running copiously, and no impediment offered to the bars that the smelter puts into the furnace from time to time, to be sure that it is not clogging; everything is as it should be; but if the blast is intercepted and the other things right, the trouble is above the twyers and consequently not to be got at so easily, and only to be removed by some change in the charging, which should be increased in flux and fuel and lessened in ore until this difficulty is removed. In case the slag is not as thin as it should be, more flux should be used, and if the furnace is clogged below the twyers it must be barred out by the workmen. As a general rule the furnace at the feed hole should be kept "dead," i. e., with no visible flames at that point, in order to avoid loss by fumes. Sometimes, however, to burn out obstructions above the twyers the fire is brought to such a point and the furnace charged so little as to permit the flame to be seen at the feed hole.

We have not mentioned reverberatory furnaces as they have been but little used on this coast, the labor being greater to reduce the same amount of ore by them and the blast consequently having the preference.

In conclusion we would say that in our opinion when the people of this coast have obtained the same experience in smelting as they have in amalgamating, and railroads reduce rates so as to reduce the price of fuel in remote regions, smelting will be not only profitable to a few, but will furnish a living to thousands, and many mines now deemed worthless will be made of great value to their owners and to the country generally. At some future time we

may discuss the propriety of refining argentiferous lead bullion at this place it is manufactured.

A Very Unusual Mineral.

EDITORS PRESS:—In presenting you with a sample of the very rare mineral—the "Molybdate of lead"—(sent by Captain John Tonkin from the Tecoma mine, near Buel City, Nevada, for examination,) it may be interesting and valuable to many of your readers to know its principal characteristics, and general comportment before the blowpipe, etc., some of which are new, and others not in strict accordance with book records.

It has been found of various colors, from orange yellow to aurora red, and from wax yellow to gray and brown; these samples are, for the greater part, bright amber yellow, certain portions being changed by oxides of iron, to snuff-color; the amber parts are crystallized either into irregular tables, which lie at all angles, or as very flat, four-sided prisms, of strictly lamellar structure, which may be cloven with the greatest ease, parallel to their base, to thin scales, whilst the whole stone is so soft and friable that it may be crumbled between the fingers more like an artificial drug than a natural mineral.

When heated, it first decrepitates into very numerous thin scales, which on increase of heat becomes of a dark, wax yellow, (returning as before to pale amber yellow when cold) on the temperature being still further increased it fuses into a light sulphur yellow mass.

Fluxed with carbonate of soda it may be smelted on charcoal, in the blowpipe's yellow flame, when about half its weight of lead will be reduced to one or more buttons, whilst the molybdic acid will pass into the coal, this is similar to tungstic acid, with the difference, that after the removal of the lead, the molybdenum may be oxidized before the blue flame, to coat the surface with its copper colored oxides.

When fused with carbonate of soda in platinum wire, it forms a limpid molten glass, which becomes milk white when cold. This bead when fused on charcoal in or before the blowpipe's flame, passes into the coal and the red oxides may be made to disappear, as best seen by a lens.

Fused with borax in platinum wire before the point of the blue flame, the resultant glass is dark yellow when hot, and of beautiful opaline appearance when cold; but when an excessive quantity is added, the glass when hot is dark red, then yellow, and when quite cold, a bluish-gray opal. This manner in which this opaline appearance closes in from the wire to the center of bead, during the cooling, is very characteristic. Merlet's moist method may also be resorted to for the detection of molybdic acid in this mineral, as follows:

Fuse the powdered sample with nitre in a platinum spoon or crucible, then dissolve this molybdate of potash thus formed, in water boiled over a spirit lamp (or hot stove) filter or pour the clear liquor into a porcelain dish (or saucer) then, after placing a small piece of bright copper therein, add to the boiling solution just sufficient hydrochloric acid to dissolve some of the copper, which will form a general light green solution, and after some time (if molybdic acid is present) just immediately over and around the metallic copper, its characteristic indigo blue. This is a very exacting test for a very small quantity,

J. S. PHILLIPS, M. E.

San Francisco, Dec. 31, 1872.

Cheap Coal.

Notwithstanding the extensive deposits of coal in the neighborhood of Coos Bay and elsewhere on our coast, the citizens of San Francisco pay pretty high prices for coal. The only three mines shipping coal from that district to this city at present are the Eastport, Newport and Hardy. Some comes from Mount Diablo, and considerable is brought here from Sydney and from England. The reported discovery of coal in the vicinity of Temecula, in San Diego county, has been confirmed, and several claims have been taken up under the new law.

If the coal is mined systematically and the business carried on in a more extensive manner than it is at present, we have little doubt but that it will be a profitable investment. The coal companies at present at work pay regular monthly dividends and are very profitable institutions to the stockholders. In fact the greatest drawback to our manufacturing interests in this city is the great scarcity and high price of fuel. There are known to be extensive deposits of coal all over this coast and still many of the places remain even unprotected. It seems rather peculiar that while coal mining here has proved so successful, financially, where the mines have been developed, that no more capital has been invested in the business. Let us have cheap coal by all means and plenty of it. It will help build up our manufacturing interests, be of the utmost benefit to many poor families and be as important a thing for the welfare of the city as can be done.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Dec. 31st, 1872.

For WEEK ENDING DECEMBER 17TH, 1872.

CHURN.—James W. F. How, Douglas Co., Oregon.

SAW-SHARPENING SWAGE.—Alfred J. Hinds and James S. Howe, Santa Cruz, Cal.

THRESHING MACHINE.—James T. Watkins, Santa Clara, Cal.

PORTABLE WATER HEATER.—John S. Woolsey, Gilroy, Cal.

MINERS' SAFETY CANDLESTICK.—Theodore A. Washburn, Gold Hill, Nevada.

BED BOTTOM.—David P. Mahan, Antioch, Cal.

REISSUE.

HYDRAULIC MINING APPARATUS.—Frank H. Fisher, Nevada City, Cal.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Eclipse Gold Mine, Inyo County, Cal.

Eds. Press:—Naturally feeling some little interest in the welfare of this mine, I have from time to time, read the *London Mining Journal* and other papers relating to it, and at last seeing in the *Inyo Independent* Mr. Polkinghorn's reply to Tamblin's remarks on the mine, inserted in former, and judging from the tenor of same, that many may run away with the idea that the mine never can be made profitable, I beg to say, from my knowledge of the property, to those interested, that I consider the Eclipse with water-power of large capacity for milling purposes, or such as I understand the company are in possession of, second to no gold mine on the Pacific Coast, if handled in its management by parties who thoroughly understand both mining and milling such ore; but to think for a moment, that anyone accustomed to pick and gad is a fit manager, is decidedly wrong, and the like is too often the cause of such failures, as made in this mine. It is to be very much regretted that such is also too frequently the case in foreign mines, especially where the character of the ore differs so much from home mines, or to that which the parties sent to manage are accustomed to. The process at the mill, and assorting or separating the ore in the mine, not only bothers, but make many a good man of experience, after doing his best, think he has a great deal to learn to treat it right; hence, permit me to ask your numerous readers, where does the good lay in a stranger to such ores.

I am fully convinced if both managers engaged in this mine, prior to the present one, could and would speak the truth in regard to it, they would admit that they knew but little of the component parts of the Eclipse Lode—what to save for milling or smelting, or which to throw away—in case at any time a portion of the lode should be minus both gold and silver. And not being conversant with that part containing base metal makes it still worse, being detrimental to amalgamation in saving the precious ore. If such is not separated and thrown aside whilst breaking the ore underground, it never can be done after, to any advantage of moment. This important point being elighted or overlooked was the cause, no doubt, in a great measure of the rock paying so much less than the average made by the old company.

I assure you at the time of my leaving the present company, that the pile of ore at the mill, some eighty tons or more, taken out of the mine long before the purchase of the property, by the present owners, would have paid close on \$25 per ton, if treated rightly in melting; this yield being the lowest ever made from the same ore taken from the same pile and dump. My full impression always has been, and is yet, in fact, that in shape of reserves there still remain in the mine, large quantities of the same kind of ore. After my leaving the property, I can't vouch for anything poor Trellas, or his foreman Tamblin did. They might have made a bad mixture of the ore in breaking it, and I think more than likely they did so. At all events, permitting me to speak plain, I attribute the failure of the Eclipse entirely to bad management on the mine, and I do hope that the present manager, Captain Jones, will repair to the company the great waste occasioned by it. The mine, with its large and highly metalliferous lode, I have looked on to be very valuable, though knowing it would take capital to bring it out; but the company, having perfected that great desideratum, water-power, should now especially make a desperate effort for another trial, under different management, as in their ultimate success I have the greatest faith.

JOSEPH ENDREY.

Hendee's Patent Gun Lock.

The accompanying cut shows an improved gun lock, the invention of Edwin B. Hendee, which consists of a cock or hammer and trigger, constructed and arranged to operate in connection with each other so as to dispense with the use of the tumbler, sear and sear-spring, heretofore in use. The ordinary breech-piece of a gun, which fits against the under portion of the stock, is extended and the guard is secured to it. The nipple, *a*, communicates with the chamber in the barrel from the under side, as shown, being secured in a proper sized hole, which is made at any angle through the breech of the barrel near the forward part of the guard. The hammer, *C*, is hinged to the guard between two lugs, so that when it stands vertical its striking face will bear upon the nipple, *a*.

A strong steel spring, *e*, is connected to its

HENDEE'S PATENT GUN LOCK.

lower end by means of a link, as shown, and is bent so as to be parallel with the guard, its opposite end being secured between the guard and gun-barrel, *a*, or stock. Across the upper face of the hammer is a groove or channel, which serves to catch the half-cock notch. The trigger, *D*, is hinged to the plate above the hammer, and is held by a small rivet, at the proper angle, the finger-piece of the trigger being formed at the opposite end. In the face of this trigger, *D*, which is next to the hammer,

when the cover is off. The cap being entirely below the gun, the eye will be protected from defective caps or flying pieces. The hammer can readily be brought to a full cock while the gun is in position to be fired, and the gun then fired very quickly, especially when provided with a self-loading device. The parts, being outside, are easily cleaned and kept in order. This lock can be applied to arms of all descriptions. Parties desiring further information can address Mrs.

Fig. 1

THE AMERICAN BOTTLE FILLER.

is a peculiarly shaped recess, into which the grooved end of the hammer, *C*, enters when drawn back, and forms the half-cock, in which position the groove in the end of the hammer, *C*, and the recess in the face of the trigger, *D*, with their projecting parts, form a dovetail which holds the hammer, *C*, firmly, and from which position the hammer will not be released by drawing upon the trigger.

Just back of the recess, on the trigger, *D*, is a projection which is slightly curved backward, so that the hammer can be drawn past it and catch at the full cock on its concave side, the point of the projection entering the groove in the hammer, *C*, from which the hammer can be readily released by drawing backward on the trigger, *D*, the reactionary force of the spring, *e*, causing the hammer to strike the nipple, *a*, with the force necessary to explode the cap. In order to protect the lock from the weather, and remove every possibility of accident from carelessness in handling or otherwise, a cap or cover is provided, which is made of a suitable shape to slip over the guard, and thus enclose the entire lock. This cap can be removed in

M. J. Hendee, widow of the patentee, room 45, No. 314 Bush street, in this city.

PERSONAL.—Mr. O. H. McKee, for several years last past chief of the Mining Claims Division, General Land Office, Washington, D. C., has recently resigned and formed a connection with Messrs. Hoyt & Sears, Mining Attorneys, Merchants' Exchange building in this city. The specific knowledge of the technicalities of the mining laws of Congress and rulings thereunder possessed by Mr. McKee, will render his services especially valuable to parties desiring mining patents or wishing to present adverse claims. The card of the firm of Hoyt, Sears & McKee will be found in another column.

THE MINING WAR AT POCHE.—On the 27th ult. the Picoche Phoenix Mining Co. took possession of about 100 feet of ground, lately worked by the Raymond & Ely company and claimed by both companies. A barricade was raised by the Phoenix on the disputed ground and other preparations made to hold it. One of the Phoenix men was killed while the parties were exchanging shots. Since then the hostility has ceased and no farther violence is anticipated. The Raymond & Ely people agreed not to work west on levels Nos. 4 and 5 and the Phoenix people agreed not to work east from winze, while the latter retain possession of all the ground they hold.

The American Bottle Filler.

Among the articles brought into requisition on this coast by the necessities of our large and increasing wine interest, are bottle fillers, designed to do away with the slow and tedious process of filling bottles by hand, where large numbers have to be filled. The latest improvement in this useful machine is that of Messrs. Armstrong & Marks, which was patented through this agency, and a sketch of which is shown in the accompanying cut. The inventors of this machine claim that one man can do as much work with it as three can without it. In fact, it is only a question of how fast a man or boy can handle the bottles, as it will fill bottles faster than the full ones can be removed and empty ones replaced.

A, represents the tank or reservoir in which the liquid to be bottled is contained. One or more siphons, *D, D*, are secured at their middles to the edges or sides of the tank by means of urns or trunnions, so that one leg will pass down inside of the tank while the other hangs outside. A cap, *E*, fits over the inside end of the siphon, (Fig. 2,) to the upper end of which a spiral spring, *d*, is secured. This spring coils around the tube upward, and is secured to it at some point between the cap and bend of the siphon. The cap, *E*, has an opening at one side, as shown, a short distance above the end of the tube through which the liquid passes when the cap is in position. It will be seen that the spring will draw the cap upwards so that its closed end will be against the open end of the tube; but when the cap is forced downward the opening on the side of the cap, *c*, and the liquid enters the siphon.

In order to operate this cap, a rod, which has its lower end secured to the cap, extends upwards to a sufficient distance to strike the underside of a bar which passes across the tank, *A*, just back of the siphons. Now when the leg of the siphon, *D*, which is outside of the box, *A*, is forced toward the box, the leg inside of the box is raised so as to cause the rod to open the inner end of the siphon; and when it is again freed, the force of the spring will again throw the siphon to its former position and close the inner end.

In order to cause the siphon to retain its charge when not in use, the outside extremity of the outer leg is closed and an opening made in the side of the pipe just above the closed end. This opening is not as large as the hole through the siphon tube. This the inventors have discovered will cause the siphon to hold its charge until the inner end is opened and the liquid allowed to flow through it, thus rendering the siphon automatic and perfectly under control. Secured horizontally to the tank, *A*, is an outward projecting flange, *B*, in which a recess is made opposite each siphon. A latch, *C*, is hinged to this flange and a spring draws it arms the opening in the manner shown. To fill the bottles the outer leg of the siphon is introduced into them until the head around the upper end of the bottle rises above the flange, *B*. The bottle and outer leg of the siphon are forced towards the tank until the neck of the bottle enters the recess in the flange, *B*; the latch *C* then embraces the outside of the neck below the head and holds it in position.

This same movement lowers the cap in the opposite or inside leg of the siphon and allows the liquid to run through until the bottle is filled. By keeping the liquid in the tank at the proper level the bottles will not overflow and the work of filling can be accomplished without waste. The bottles being held by the neck in a similar position would be all filled. The removal of the bottle from the latch causes the valve at the rear end of the siphon to close and stops the flow; while the removal of the bottle from the siphon causes displacement enough to admit of corking without bursting the bottles. The siphons when once charged will retain the liquid an indefinite length of time.

To use the machine the apparatus is placed in front of the hogshead containing the liquid, so that the faucet will project over the top of the tank *A*, or it can be connected by hose if more convenient. When the tank is filled to a level with the latches *c*, and by the usual manner fill the siphons and release them from the latch. The attendant then places himself in front of the apparatus, with the empty bottles at his left hand and space for full ones on his right. A bottle is placed on the end of the first siphon and it is pressed into the latch, the others in proper order. By the time the last bottle is in the first is full; this is removed with one hand and a new bottle placed in its stead, and so on. By this means a large number of bottles can be filled in a short time with little labor. The inventors claim that any one can, after a little practice, fill 75 dozen bottles per hour with this machine. Parties desiring further information can address James Armstrong, No. 240, 6th street, or Samuel Marks, corner Folsom and Fourteenth streets, in this city.

DOMESTIC ECONOMY

Table Customs.

EDITOR OHIO FARMER:—It is a sad fact that there are many families in the country in which exists a feeling of inferiority when thrown into the company of city or refined people. This feeling is not lessened when they are playing the part of hosts, and the awkwardness felt is in exact keeping with the home customs. Well-to-do families are not unfrequently found in the rural districts wherein there is a great want of system, order and politeness, and especially is this found at the table.

A lady from the city, or any well-regulated household, does not feel comfortable when seated at the table of a friend or simple acquaintance, as the case may be, and requested to "help herself or be at home," and she had a thousand times rather "be at home" than to reach over the table for this and that in place of being helped. It does not increase her appetite at all to have the madam cut bread from the loaf as it is wanted with the knife she is eating with, nor to see each member of the family cut from the butter with their individual knives, first drawing them through their mouths to make them clean (?) or to have the pie cut with an eating-knife and passed around, each taking a piece upon a greasy plate, and perhaps one-half filled with meat, potato, cabbage, etc.

I might enumerate any number of such delicacies, far too often practiced, but will not take up space to do so, but wish to simply add a suggestion as to the remedy. A family, to appear well to others, must be so systematized in its regulations that there is harmony at all times in action, if not in words. Cultivation is not necessarily dependent upon capital, for those the most humble in circumstances can have admirable harmony in their home affairs. Seventy-five cents will supply a table with a very neat silver-plated butter-knife, and every pantry is supplied with sufficient cutlery to afford an extra knife for the bread, meat, pie, and with sufficient table-ware to afford each a clean plate for pie, a cup for boiled egg, etc. The bread can be as well cut in the pantry and brought to the table properly sliced, as to be messed out as required; the pie can as well be served on small, clean plates from the pantry as in the manner above mentioned.

Now, some may say that this method is more trouble than profit, and not necessary to practice when only the family is together. I do not propose to argue the question at all, but will add, if not practiced when the family only is together, it never will be. The members of one's family should be the dearest objects of earth; the sons and daughters should be taught those rules in social life which will enable them to stand above ridicule and command respect, and every one is at liberty to adopt them, for they are free. I said, however, that I would not argue the question, and I won't.—*Ohio Farmer.*

INDIAN FRITTERS.—Take three tablespoonfuls of flour, boiling-water, the yolks of four eggs, the whites of two, hot lard or clarified dripping, and jam. Put the water into a basin, and pour over it sufficient boiling-water to make it into a stiff paste, taking care to stir and beat it well, to prevent it getting lumpy. Leave it a little time to cool, and then break it into it (without beating them at first) the yolks of four eggs and the whites of two, and stir and beat all well together. Have ready some boiling lard or butter; drop a dessertspoonful of batter in at a time, and fry the fritters of a light brown. They should rise so much as to be almost like balls. Serve on a dish, with a spoonful of preserves or marmalade dropped in between each fritter. This is an excellent dish for a hasty addition to dinner, if a guest unexpectedly arrives, it being so quickly made, and it is always a great favorite. It takes from five to eight minutes to fry the fritters.—*Mrs. Beeton's Everyday Cookery.*

APPLE TAPIOCA PUDDING.—One coffee-cup of tapioca, covered with three pints of cold water, and soaked over night. In the morning set it on the side of the range, or stove, stirring it often, till it becomes transparent. If too thick, add more water, till it is as thin as good, clear starch. Stir in a small teaspoon of salt. Pare and core, without breaking, as many good apples as will set close on the bottom of a medium-sized pudding-dish. Fill the holes full of sugar, and a very little nutmeg and cinnamon; then pour over the tapioca, and bake slowly till the apples are soft and well done. To be eaten with hard sauce, which is made as follows: One cup sugar, two-thirds of a cup of butter, beaten together until perfectly smooth and white.—*Western Rural.*

APPLE SOUFFLE.—Always stew the apples nicely, then adding a little grated lemon peel and juice, and omitting butter; line the sides and bottom of a baking-dish with them. Make a boiled custard with one pint of milk and two eggs, flavoring with lemon and sweetening it to taste. Let it cool, and then pour into the center of the dish. Beat the white of two eggs to a stiff froth (they can be left out of the custard), spread them over the top; sprinkle white sugar over them, and brown in the oven. The stewed apples should be about half an inch thick on the bottom and sides of the pudding-dish.

CARRIAGE CUSTARD.—Procure an ounce of carrigan moss, and divide it into four parts; one part is sufficient for one mess. Put the moss into water, and let it remain until it swells; then drain it, and put it into two pints end a half of milk, and place it over the fire; let it boil twenty minutes, stirring it continually; then strain it, sweeten it with loaf-sugar; put into cups, and grate nutmeg over the top of them.

Coal and Quicksilver.

The two leading wants of the State are fuel and quicksilver. Both are essential to the mining and reduction of our gold and silver ores, and the prices of both are steadily increasing. The consumption of wood and timber in carrying on mining operations in Storey county alone is enormous. Within a circuit of five miles, including Virginia and Gold Hill, not less than 600 cords of wood are consumed daily. This consumption is at the rate of 18,000 cords per month, or 216,000 cords yearly. All of ninety per cent. of this wood is used in the mills and hoisting-works connected with the mines. In addition to this, the timber consumption in the mines is a heavy daily draft upon our vanishing wood-ranges, and our future timber and wood supplies are matters of increasing anxiety. The accessible mountains, for many miles west of us, have been stripped of their timber, and the bulk of our supplies is brought a distance of from thirty to fifty miles. The wood is flumed down the mountain-sides, where water for the purpose is obtainable, and floated down the Carson River and its tributaries. Thence to this city and Gold Hill it is brought by rail.

For the supply of this market, wood-lands have been located between sixty and seventy miles distant, and the question of fuel is becoming one of grave importance. The hope is that our timber-lands may be relieved of the enormous drain upon them by the discovery of coal somewhere within the State. Small deposits of an inferior quality have been found near Reno, Elko, and within fifteen or twenty miles south and east of this city, but nothing of real value has yet been discovered. Coal indications, of more or less promise, have been found in many localities throughout the State, and in view of the importance of the fuel question, the possibility of the existence of coal here is enough to warrant substantial encouragement in searching for it. Only second to this in importance is the question of quicksilver. The leading cinnabar mines of the world are either owned by or under the control of a gigantic combination of capitalists, and a continued increase in the price of quicksilver may be expected. This combination embraces the control of the New Almaden and New Idria mines of California, from which our supplies of mercury are drawn. The former is one of the richest and most extensive cinnabar deposits in the world, and could easily be made to yield double the quantity of quicksilver now produced by it; but the product is limited by the combination, in order that the price may be maintained, and nothing in the way of relief need be looked for in that quarter.

The consumption of quicksilver in the State amounts to many thousands of pounds daily, and the discovery of a productive cinnabar mine in Nevada would be of immeasurable value to our mining interests. As we said before, coal and quicksilver are our great wants, and as it is possible that both may be found in the State, the next Legislature might with great propriety and general approval offer a reward for the discovery of both. To this end let some of our newly-elected legislators give the matter the attention it deserves, and prepare a bill with provisions something as follows: With the view of encouraging the search for coal and quicksilver, the State will agree to pay a premium of ten thousand dollars for the first 100 flasks of quicksilver produced from a cinnabar mine within the State, and ten thousand dollars for the first 100 tons of coal mined in the State, of a quality not inferior to the Rocky Mountain or Mount Diablo coal. Should the offer result in the discovery either of coal or quicksilver, the money would be well bestowed. The mining industry of the State is the corner-stone, yes, the arch and pillar of our prosperity, and the least the commonwealth can do to assist in providing means to work our precious metal mines after they have been discovered and opened by private enterprise.—*Virginia Enterprise.*

FROZEN UP.—Says the Nevada Transcript: Charles Marsh, Secretary of the South Yuba Canal Company, informs us that all the water in the upper part of the county is frozen up, and the ditches are blocked completely. Thus far this season four inches of water has fallen, the aggregate being an inch less than at this time last season. Little mining can be done in the gravel mines in the county until after from ten to twelve inches of water has fallen at this place. When such a quantity falls the ditches are full, and nearly all the leading mines can be supplied. Very extensive preparations for hydraulic mining have been made in the county this year, and a good season with abundance of water, will make this branch of mining exceedingly lively.

Very extensive preparations for hydraulic mining have been made in Nevada county this year.

Delays of Law—Courts of Conciliation.

No one has satisfactorily answered the question, why is the business of our Courts always behind hand? This subject occupied the attention of the French Government, years ago, and a remedy was devised, which has worked admirably in all lawsuits that occur in the ordinary dealings of industry and commerce.

Courts of conciliation were appointed for every district of town and county. The Judges are selected from retired men of business generally, who know the usual disputes between neighbors, and who have an instinct that quickly discerns which is the crooked stick. We have by invitation, attended the hearing and deciding, in a case in Paris. The written agreement, as is usual, had been drawn by the magistrate two months before. In a moment he perceived who was wrong, and in ten minutes the case was settled. He invited the plaintiff to retire, and then addressed the defendant: "My friend, you have got the wrong impression, will you take my advice?" "Yes, sir." "Then let me settle the matter for you." The defendant retired and plaintiff re-entered. "It was a Madame. Madame," said the Judge, "you are both good people—too good and too wise to affect yourselves, and break friendship over such a matter. I am sure you would willingly yield a little on both sides rather than nurse ill-feeling." "Oh, yes, Monsieur, if he would also be reasonable. I leave it all to you, Monsieur." In a moment they shook hands; apologized for words said in anger; all was settled and two adversaries were made friends. Moreover they entered into an extended contract, in proof of reconciliation. No lawyer appears, no costs are paid, and not one case in fifty is ever appealed. And of such appeals, not one case in a hundred is ever reversed. Surely the system is eminently practical for California. Let benevolent minds be interested in advocating this most desirable reform.

There are just such men in California, who are competent in capacity and inclination for judges of courts of conciliation, and to whom such daily occupation from two to three o'clock would be a merciful dispensation, to say nothing of the alluring title it would confer. They must have no politics. How much ill-feeling, how much permanent malice now engendered would be averted, if all mechanics and tradesmen would make bargains before such a judge and mutually agree to be bound by his final decision!

This is worthy of the notice of all associations. It ought to be the leading object of every united confraternity to confer upon its members and their families, the unquestioned benefits of this system, as well for its economy as for its morality.—*Alla.*

Shell Mounds on the California Coast

San Pablo is about fifteen miles from Oakland, and lies almost due north, and the road follows the beach. When within three miles of the town we came to a shell mound, says a correspondent of the *St. Louis Globe*, rising up from the plain to almost the dignity of a hill, and which is now covered with a growth of shrubbery. There is no telling when or by whom that mound was raised, but it is almost a mile long and half a mile wide.

Fragments of pottery made of red earth, not to be obtained anywhere in this State, are found on the surface and near the top; and about two years ago Mr. McHenry, the owner of the land, dug a trench, and at a depth of twenty feet, sixty feet in from the west, near the base, found numerous skeletons of Indians of all sizes, and some bones of dogs and birds, and many implements of stone. One baby had been rolled in a monstrously long piece of red silk, like the mummies, and had been covered with a coating of a sort of asphaltum. Mr. McHenry also found in other parts of the hill evidences enough to show that this mound was a burying place for some extinct tribe of Indians, as the skulls are different from all others known in some particulars.

Where the red silk came from would puzzle any one to know, as this must have been a primitive race, judging by the rude implements and utensils. All the skeletons were in a sitting posture, with their faces turned northward. The shells that form this mound are oyster, clam and mussel shells, all having been exposed to the action of fire, and nearly all broken fine. Very rarely are entire shells found. The same kind of mounds, though not so large, are found near San Mateo, on the San Francisco side. They are all near the shores of the bay, and have been made of shells of the oysters and mussels that the Indians used as food, and which they evidently roasted to open.

CO-OPERATION IN GREAT BRITAIN.—Co-operative societies are much more numerous in Great Britain than most people would suppose. We see it stated that one wholesale co-operative society in the north of England supplies 99 other societies with goods, "and has no less than 235 societies in federation," and that its sales for the year ending April 1 amounted to over \$3,793,820. Another society in Scotland had 97 retail stores "in federation"—or as branches, we suppose—selling annually \$1,000,000 worth of goods. A retail society at Oldham has 8,000 members, a capital of \$2,550,800; and its receipts for last year were \$1,550,000. In all, there is about 4,508 societies, with over 400,000 members, and many societies number from 1,000 to 4,000 members.

What is Slate, and How was it Formed?

That slate may have been once mud is more probable by the simple fact that it can be turned into mud again. If you grind up slate, add then analyze it, you will find its mineral constituents to be exactly those of a very fine, rich, and tenacious clay. Wherever the top of the slate beds and the soil upon it is laid bare, the black layers of slate may be seen gradually melting, if I may use this word (says the Rev. Charles Kingsley in "Town Geology"), under the influences of rain and frost, into a rich tenacious clay, which is now not black like its parent slate, but red, from the oxidation of the iron which it contains. But, granting this, how did this first change take place? It must be allowed at starting that time enough has elapsed, and events have happened, since our supposed mud began first to become slate, to allow of many and strange transformations. For these slates are found in the oldest beds of rocks, save one series, in the known world; and it is notorious that the older and lower the beds in which the slates are found, the better—that is, the more perfectly elaborate—is the slate. The best slates of Snowdon (I must confine myself to the districts which I know personally) are found in the so-called "Cambrian" beds. Below these beds but one series of beds is as yet known in the world, called the "Laurentian." They occur to a thickness of some 80,000 feet, in Labrador, Canada, and the Adirondack mountains of New York; but their representatives in Europe are, as far as known, only to be found in the northwest highlands of Scotland and in the island of Lewis, which consists entirely of them. And it is to be remembered, as a proof of their inconceivable antiquity, that they may have been upheaved and shifted long before the Cambrian rocks were laid down "unconformably" on their worn and broken edges.

THE BESSEMER SALOON STEAMBOAT.—The project of the Saloon for the avoidance of seasickness seems to have taken tangible shape since the demonstration of the fact that the anticipated results will follow from such a mode of construction. Mr. Bessemer has associated himself with Mr. E. J. Reed, a gentleman of means and scientific attainments, to carry out the project, and a company has been formed with a capital of \$1,250,000. Two vessels are to be immediately constructed for the Channel navigation. In addition to the advantage of the comparatively motionless Bessemer saloon and promenade deck, they will embody every improvement for space, comfort and speed that the skill of the designers can introduce.

THE DISCOVERY OF PETROLEUM IN PENNSYLVANIA.—We made reference, a few weeks since, to some "Notes on the History of Petroleum," read before the Academy of Sciences of this city, by Mr. R. E. C. Stearns wherein he traced back the discovery of petroleum, or rather what was supposed to be the first printed mention of it to the *Massachusetts Magazine* for 1789, page 416.

A correspondent of the *American Chemist* now furnishes that journal with an extract from an "old book," published in 1772, in which is found a map entered according to Act of Parliament in 1771, upon which the exact location of the "oil spring" is set down, upon the banks of what is now known as Oil Creek, in the northern part of Pennsylvania.

NEVADA SALT AND SODA BEDS.—The *Carson Register* says that the borate of soda and salt beds of that country are receiving the attention of capitalists, and that preparations are being made to work them on an extensive scale. As soon as the road from Columbus to the Nine Mile House, this side of Aurora, is completed, one Nadau expects to have freight enough from the working of these beds to keep thirty-two ten-mule teams constantly employed in hauling to this place.

VIRGINIA GOLD MINE.—The gold mines of Spottsylvania county, Va., are still worked to advantage. According to the *Fredericksburg Ledger*, the work is vigorously prosecuted at the White Hall mine, and in the Old Dominion four new shafts have been sunk, each one hundred feet in depth. New buildings and other improvements to the value of \$20,000 have also been added, and the work now in progress employs forty hands. The ore lately taken from this mine is said to be very rich.

LAKE SUPERIOR GOLD.—A mining engineer, who has spent some time in exploring upon the north shore of Lake Superior, reports that the gold discoveries on Lake Sheldandown, of which so much was said a year since, turn out to be of little practical importance. There is gold there in quartz rock, in well defined veins, but it cannot be made to yield more than forty dollars per ton, and this is not enough to pay the cost of getting it out.

RAILROAD IRON.—The importations into the United States of iron rails for the eleven months ending with November, were 186,084 tons, against 200,123 tons in 1871, or enough probably for 2,115 miles of track this year, and for 2,275 miles last year. The imports in November were very light—11,411 tons—but of this more than one-half was steel. The American production is much greater this year than last.

THE LEAVENWORTH, LAWRENCE & GALVESTON, AND KANSAS CITY AND SANTA FE RAILROAD COMPANIES are building large machine shops at Ottawa, Kansas, at a cost of \$400,000.

READ THIS.
HEALTH FOR ALL.

What is Wealth, or Fame, or Life, Without
Health?

Persons afflicted with any Disease, helped or not by
other treatment, should consult DR. AIKIN, who effects
many astonishing cures, and treats, with unequalled
success, all those serious, obstinate diseases (not
understood or well treated by the family physicians or
others), and performs the more difficult, particular
operations in Surgery.
The Approved, Scientific Treatment given by

DR. AIKIN

CHRONIC AND CHRONIC DISEASES OF THE
Eyes, Ears, Throat, Lungs, Heart, Nerves,
Stomach, Liver, Kidney and Blood; including
Catarrh, Deafness, Discharges from the Ears,
Falling Sight; Sore, Weak, or Inflamed Eyes;
Cough, Bronchitis, Consumption, Night Sweats,
Epilepsy, Palsy, Nervous Affections, Debility,
Neuralgia, Rheumatism, Dyspepsia, Piles, Dropsy,
Scrofula, Fever Sores, Skin Diseases, Erysipelas,
Corpulence, Gout, Hæmorrhoids, Fistula, Rupture, etc.
Ladies out of Health, assured of Speedy,
Safe Cure.
Cancers and Tumors easily removed; also, Wens,
Warts, Enlarged Tonsils, and Disfiguring Marks.
Young or old, desiring to attain and preserve full
health and vigor, no matter what they have read or
doctored, first or last, will be given conscientious coun-
sel and reliable aid, without quackery or deception;
and those affected with blood or other diseases, who
would avoid mercury, poisons, or nauseous drugs, can
be sure of obtaining of DR. AIKIN the most efficient
treatment by mild remedies, and a rapid, thorough and
permanent cure. Those visiting this city (travelers,
miners, and others) are advised to consult DR. AIKIN
for skillful and satisfactory treatment of any case,
medical or surgical. Terms reasonable. Medicines, if
most, supplied. Patients, of every class, can rely on the
most careful attention and best results. Do not suffer
or delay, nor use the worthless, injurious patent medi-
cines.
Whatever your disease or circumstances, or doctoring
in vain, do not despair, for you can here be certain of
relief if ever curable.
Omeo prepared to arrange requisite treatment.
Office hours, 9 to 3, and from 4 to 8. Sundays, 12 to 2.
Call, or write symptoms carefully, and send (by regis-
tered letter, P. O. Order or Draft) \$10 to \$50, according
to case, for Advice and supply of Remedies by Express.
Address N. J. AIKIN, M. D.

posite Occidental Hotel, San Francisco. 21v25eow3m

EUCALYPTUS.

The attention of the Medical profession is respectfully
called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of Intermittent and Marsh
Fever, often supplanting the use of Quinine. The
paroxysms of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Blad-
der it seems to act like a specific.
This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus
THE ELIXIR OF EUCALYPTUS.
This compound presents the properties of the leaves
in a palatable form and elegant appearance. Dose—
One tablespoonful, to be repeated as often as the case
demands.
Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.
Prepared and sold by JAMES G. STEELE & CO.,
Chemists and Apothecaries,
No. 521 Montgomery St., between Clay and Commercial,
San Francisco. no28

P. S.—The article wanted is known under the several
names heading this adv. It is a peculiarly white and
hard substance, infusible, looks like chalk, but scratches
wood instead of marking it. de14-1m

Patent Ore Bags—A New Article.
These bags, by virtue of a patent lining, prevent ore
siftings, and are the most durable bags used.
For sale by
A. GERBERDING,
318 Front Street, Room 10. S. F.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as follows:
The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.
Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.
Declared by Counsels-
sors to be the only good
SAUCE
Caution Against Fraud.
The success of this most
delicious and unrivaled
Condiment has long caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way
to secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.
Some of the foreign markets having been
supplied with a spurious Worcestershire
sauce, upon the wrapper and labels of which the names
of Lea and Perrins have been forged, L. and P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-
ter; Crosse & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. 16v24-1f

SAN FRANCISCO, CAL.

Mining Laws Under the New Code.

Mining Corporations.

584. Every mining corporation may change its principal place of business from one county or city to another, within this State. Before such removal is made the consent in writing of the holders of two-thirds of the capital stock must be obtained and filed in the office of the corporation. When such consent is obtained, notice of the intended removal must be published for thirty days in some newspaper published at the principal place of business of the corporation, giving the name of the county or city where it is then situated, and that to which it is intended to remove it.

585. When the publication provided for in the preceding section has been completed, the Directors of the corporation must file in the offices of the Clerks of the counties from and to which such change has been made, and in the office of the Secretary of State, certified copies of the written consent of the stockholders to such change, and of the notice of such change, and proof of publication; also, a certificate that the proposed removal has taken place; and thereafter the principal place of business of the corporation is at the place to which it is removed.

586. Any corporation organized in this State for the purpose of mining or carrying on mining operations in or without this State, may establish and maintain agencies in other States of the United States, for the transfer and issuing of their stock; and a transfer or issue of the same at any such transfer agency, in accordance with the provisions of its by-laws, is valid and binding as fully and effectually for all purposes as if made upon the books of such corporation at its principal office within this State. The agencies must be governed by the by-laws and Directors of the corporation.

NOTE.—Stats. 1863-4, p. 429, Secs. 1, 2.

587. All stock of any such corporation, issued at a transfer agency, must be signed by the President and Secretary of the corporation, and countersigned at the time of its issue by the agent having charge of the transfer agency. No stock must be issued at a transfer agency unless the certificate of stock, in lieu of which the same is issued, is at the same time surrendered for cancellation.

NOTE.—Stats. 1871-2, p. 413.

An Act for the Protection of Miners.

[Approved March 16, 1872.]

[Enacting Clause.]

SECTION 1. It shall not be lawful for any corporation, association, owner or owners of any quartz mining claims within the State of California, where such corporation, association, owner or owners employ twelve men daily, to sink down into such mine or mines any perpendicular shaft or incline beyond a depth from the surface of three hundred feet without providing a second mode of egress from such mine, by shaft or tunnel, to connect with the main shaft at a depth of not less than one hundred feet from the surface.

SEC. 2. It shall be the duty of each corporation, association, owner or owners of any quartz mine or mines in this State, where it becomes necessary to work such mines beyond the depth of three hundred feet, and where the number of men employed therein daily shall be twelve or more, to proceed to sink another shaft or construct a tunnel so as to connect with the main working shaft of such mine as a mode of escape from underground accident or otherwise. And all corporations, associations, owner or owners of mines as aforesaid, working at a greater depth than three hundred feet, not having any other mode of egress than from the main shaft, shall proceed as herein provided.

SEC. 3. When any corporation, association, owner or owners of any quartz mine in this State shall fail to provide for the proper egress as herein contemplated, and where any accident shall occur, or any miner working therein shall be hurt or injured, and from such injury might have escaped if the second mode of egress had existed, such corporation, association, owner or owners of the mine where the injuries shall have occurred, shall be liable to the person injured in all damages that may accrue by reason thereof; and an action at law in a court of competent jurisdiction may be maintained against the owner or owners of such mine, which owners shall be jointly or severally liable for such damages. And where death shall ensue from injuries received from any negligence on the part of the owners thereof by reason of their failure to comply with any of the provisions of this Act, the heirs or relatives surviving the deceased may commence an action for the recovery of such damages as provided by an Act entitled an Act requiring compensation for causing death by wrongful act, neglect or default, approved April twenty-sixth, eighteen hundred and sixty-two.

SEC. 4. This Act shall take effect and be in force six months from and after its passage.

NOTE.—Stats. 1871-2, p. 443.

An Act supplemental to an Act entitled an Act concerning Corporations, passed 22d April, 1852.

[Enacting Clause.]

[Approved March 21, 1872.]

SECTION. 1. On petition of the majority of the shareholders of any corporation formed for the purpose of mining to the County Judge of the county where said corporation has its principal place of business, verified by the signers, to the effect that they are severally the holders on the books of the company of the number of shares set opposite their signatures to the foregoing petition, the County Judge shall issue his notice to the shareholders of said company that a meeting of the shareholders will be held, stating the time, not less than five nor more than ten days after the first publication of such notice, and the place of meeting within such county, and the object to be taken into consideration the removal of officers of said company; which notice, signed by the said County Judge, shall be published daily in one or more daily newspapers published in said county for at least five days before the time for the meeting.

SEC. 2. At this time and place appointed by said notice those claiming to be shareholders who shall assemble shall proceed to organize by the appointment of a Chairman and Secretary, and thereupon those claiming to be shareholders shall present proof thereof, and only those showing a right to vote shall take part in the further proceedings. If it appears that at the time appointed, or within one hour thereafter, shareholders of less than one half the shares are present, no further proceedings shall be had, but the meeting shall be *ipso facto* dissolved; provided, however, that by a vote of the holders of two-thirds of the capital stock of the corporation aforesaid, the Board of Trustees may be required to furnish to the meeting a written detailed statement and account of the affairs, business and property of the corporation, but if the holders of more than two-thirds of the shares are present they shall proceed to vote, the Secretary calling the roll and the members voting yea or no, as the case may be. The Secretary shall enter the same upon his list, and when he has added up the list and stated the result he shall sign the same and hand it to the Chairman, who shall also sign the same and declare the result.

SEC. 3. If the result is that the holders of a majority of all the shares of the company are in favor of the removal of one or more of the officers of the company, the meeting shall then proceed to ballot for officers to supply the vacancies thus created. Tellers shall be appointed by the Chairman, who shall collect the ballots and deliver them to the Secretary, who shall count the same in open session, and having stated the result of the count in writing, shall sign the same and hand it to the Chairman, who shall announce the result to the meeting.

SEC. 4. A report of the proceedings of the meeting shall be made in writing, signed by the Chairman and Secretary and verified by them, and delivered to the County Judge, who shall thereupon issue to each person chosen a certificate of his election, and shall also issue an order requiring that all books, papers, and all property and effects be immediately delivered to the officers elect, and the petition and report, endorsed with the date and fact of the issuance of such certificate and order, shall be delivered to the County Clerk to be by him filed in his office, and thereafter the persons thus elected officers shall be the duly elected officers and hold office until the next regular annual meeting, unless removed under the provisions hereof.

SEC. 5. For all services in these proceedings the County Clerk shall receive ten dollars on the issuance of the notice and ten dollars on the issuance of the certificate.

SEC. 6. All Acts or parts of Acts conflicting with this Act are hereby repealed.

SEC. 7. This Act shall take effect immediately.

Leather Market Report.

[Reported for the Press by Dolliver & Co.]

SAFETY, Tuesday, Dec. 31, 1872. Shipments of Sole Leather to the East are quite heavy, and prices are firm, though there has been no advance. Domestic Calf Skin has advanced 10 per cent., in consequence of the large amount destroyed, and French Skins are firm with an upward tendency.

A NEW BOOK.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 640 Pages and 81 Engravings. BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, \$10 (in coin); in leather, \$12. Forwarded by mail, in cloth, \$11.40, currency; in leather, \$13.75. Address all orders (wholesale or retail) to

DEWEY & CO.,

Montgomery street, San Francisco.

PACIFIC MINERAL LAND OFFICE.—HOYT, SEARS & McKEE—MERCHANTS' EXCHANGE, CALIFORNIA STREET, SAN FRANCISCO, CAL.—Mining Patents obtained for claims in California, Nevada, Utah, Arizona, and elsewhere. Plans and papers prepared for adverse claimants, as required by the new law; relocations effected where claims have lapsed under the Congressional Act of May 10, 1872; Mining Contests conducted before the Departments and Courts.

Mr. McKee's experience as Chief of the Mining Claims Division, General Land Office, Washington, D. C., will be valuable to parties desiring to properly appear either as claimants for patents or as adverse claimants. Cases attended to in person at any of the District Land Offices, or at the Departments at Washington, where deemed necessary. JAS. T. HOYT, W. H. SEARS, O. H. MCKEE. 1726-3m.

WONDERFUL CURE.—A young man, a resident of this city, gives us the facts of the following remarkable cure. He says: "I suffered with Catarrh in its worst form. Bones came from my nose; my breath became offensive; I was compelled to eat alone. I had given up all hopes of being cured. At this time met Dr. Evory, of Chicago, who had been cured by a remedy discovered by himself. I tried the remedy, with little faith; but at the end of three months I was completely cured." Our informant has now associated himself with the discoverer in the manufacture of the article, which will be known under the name of the Diamond Catarrh Remedy. Price 50 cts.; sent by mail for 60 cts. A. F. EVORY & CO., No. 9 Post street, San Francisco. Sold by all druggists. 2625-3m.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO. J. B. ROBERTS, 315 California street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

Polishing and Fluting Iron.

This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for fluting is made of brass, and highly polished. The Polishing Iron and Fluter, being in one, are both heated at the same time. We are now prepared to furnish them in quantities to suit.

WIESTER & CO.,

PROPOSALS

For Material and Work

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF BOARD OF CITY HALL COMMISSIONERS, SAN FRANCISCO, November 25, 1872.

SEALED PROPOSALS FOR FURNISHING certain material for a portion of the New City Hall Building and Hall of Records and for the construction thereof, will be received at the office of the Board of City Hall Commissioners, corner of McAllister and Leavenworth streets, until 12 o'clock M. of FRIDAY, the 27th day of December, A. D. 1872, except for Iron Works, and for that, until 12 o'clock M. of FRIDAY, the 24th day of January, A. D. 1873, viz:

10,000,000 Brick;
5,000 Barrels Lime;
5,000 Barrels Cement;
Stone for Facing of Basement Story and Building the same in the Walls, etc;
Rolled Iron Joists;
Iron Girders and Columns;
Building Brick in the Walls, etc., including Bonding, Anchors, etc.

Building Brick Facing of Basement Story;
Fixing, Fitting and Laying Iron Joists and Girders. All according to the Printed Specifications, Schedule, etc., and Plans and Drawings.

The Printed Specifications and Printed Forms of Proposals can be had on application to the Secretary, and the Plans and Drawings can be seen, and all further information—as to the details of the work, etc.—can be obtained from the Architect, at the office of the Board.

The Bids must be endorsed for the Material proposed to be furnished or Work done, and addressed to the Secretary of the Board.

No Bids will be entertained unless made on the specified "Printed Forms of Proposal," and accompanied by a certified check, or bond with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, to be returned on the due entering into the contract of the party to whom it may be awarded, or to be forfeited, if the party fail to enter into the said contract.

Each bidder for Brick will state what quantity he will furnish within one year, and at what times he will deliver the same. Samples must accompany each bid.

The Board reserve the right to reject any and all bids. Payments will be made monthly in "City Hall Warrants," of 76 per cent. of estimated amounts due, and the remaining 26 per cent. when the contract is completed.

Office, No. 415 Montgomery street, San Francisco, Cal. de21-tt

Ophir Copper, Silver and Gold Mining Company of Placer County, California. Location of works, Ophir, Placer County, California.
Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 19th day of Dec. 1872, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the company, Room 2, Express Building, at 402 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 25th day of January, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth day of February, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
Office—No. 402 Montgomery street, San Francisco, Cal. de28-tt

Piermont Milling and Mining Company— Location of works, Piermont Mining District, White Pine County, Nevada.
Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 21st day of November, 1872, the several amounts set opposite the names of the respective shareholders, as follows:
Names. No. Certificate. No. Shares. Amount.
Cohen, Henry..... 37 50 \$25 00
Cohen, Henry..... 51 10 5 00
Dickinson, E. B..... 62 250 125 00
Dickinson, E. B..... 63 250 125 00
Feusier, Henry..... 24 750 375 00
Feusier, Henry..... 46 143 71 50
And in accordance with law, and an order of the Board of Trustees, made on the 21st day of November, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of said Company, on the 24th day of January, 1873, at the hour of 2 o'clock P. M. of said day, to pay said delin-

quent assessment thereon, together with costs of advertising and expenses of sale.
J. W. CLARK, Secretary.
Office, 418 California street, San Francisco, Cal. de1-tt

Quail Hill Mining and Water Company— Location of works, Calaveras County, California.
Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 4th day of December, 1872, an assessment of ten dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 438 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 14th day of January, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 4th day of February, 1873, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees.
Office, 438 California street, up stairs, San Francisco, California. de14

San Francisco Co-operative Land and Building Association.
Notice is hereby given, that the following specified shares of stock in said Association have been, by resolution duly adopted by the Board of Directors, declared forfeited for non payment of instalments due and delinquent thereon, respectively as specified, to wit:

The highest price paid for Scrap Iron. 5v143**THE GOODWIN PUMP.**This Pump, which was awarded the PREMIUM at the last State Fair, where a large number of Pumps were exhibited, is the CHEAPEST, MOST EFFICIENT and DURABLE PUMP now manufactured.
We are rapidly increasing our Patterns and extending our facilities for manufacturing, but have not yet been able to fully supply the demand. As our Pump has no valves, it is the best Pump for mines where water containing sand or sediment, or where hot liquids have to be pumped.

It is Unsurpassed for Hydraulic Mining,

And will throw a stream of from two to six hundred inches of water with a force equal to a fall of two hundred and fifty feet. It is peculiarly adapted to windmills for irrigating, or domestic purposes, and is equally as efficient and noiseless at a high or low speed, the water raised being in the ratio of its revolutions. Our large irrigating Pumps will throw twenty thousand gallons per minute.

PUMPS FOR EVERY PURPOSE AND ALL CAPACITIES,

MANUFACTURED BY

cisco, and State Fair, Sacramento, 1871.These Lubricators are acknowledged by all engineers
to be superior to any they have ever used; feed con-
stantly by pressure of condensed water, supplied by
pipe A, regulated under the oil by valve J, and forced
out through check valve and pipe B into the steam pipe
C; it then becomes greasy steam, passes to all the
valves and cylinder at every stroke of the engine; glass
tube I indicates amount used per hour. Packing on
rods and stems lasts longer, and the rings on the piston
will not corrode. One pint of oil will last from three
to six days, according to speed and size of engine; I,
sliding gauge; K, valve to shut off when engine stops;
H, F, valves to shut off in case of frost; steam does not
enter the cup; it is always cool; warranted to give satis-
faction. Patented February 14, 1871. Manufactured by

Sketch of Delaney's New Patent Cushion.

DESCRIPTION OF ENGRAVING.

E, pin or regulator, extending into rail; D, steel wire,
tension from pin into and through rubber cushion; B, rub
ber cushion; C, is end of rubber cushion; A, lining.
Their construction is of the simplest kind, thus making
no heavy expense for superfluous elaboration. The im
provement is a steel wire running lengthwise, and commu
nicating with a pin at each end and inside of the rails;
the wire is imbedded in the rubber cushion, near its edge or
surface. The pin mentioned is controlled and operated
upon by a key, regulating the tension of the wire, accord
ing to the necessities of the case. It keeps the edge of the
cushion straight and sharp. It prevents the rubber berde
ning from the impingement of the ball; and, above all
other considerations, the angles are bound to be perfectly
correct.

The ball never lumps from the table, bowever severe the
stroke. It makes no noise when leaving the cushion.
Nine cushions are made upon our tables with the same
degree of force requisite to make six up n any other.

These unrivalled cushions are self-protective and will re
tain their elasticity other is hot, cold, dry, or damp weather,
almost forever.

Thousands of Delaney's cushions have been introduced
throughout California and the Great West, where the
large-t billiard manufacturers now make exclusive use of
them, to the eminent satisfaction of their patrons.

About California's Gold-Bearing Rocks.

[Written for the Press, by AMOS BOWMAN.]

Charles Kingsley never said anything more truly than when he said geology is the Science of Common Sense. All who have the gift of common sense may read the book of out-doors. Any standard of exclusiveness in geological observation other than the possession of the noble gift of common sense, to follow where necessary from the known to the unknown is, whenever set up, a bar to the general progress, and to scientific progress a curse. It may even be a bar to merited material prosperity, and nothing less than a curse to a State.

The geography and approximate continuations of the world-famous auriferous slates of the Sierra Nevada of California should have been determined and become universal property in outline at least, a great many years ago.

Where annually since 1849, ten thousand men of superior intelligence—chiefly miners—have been making sections of exploration across them, and several thousands have travelled along their whole length and observed them in longitudinal profile, what cloud of darkness can it have been that prevented the light of the common intelligence from beaming forth in a common recognition of the facts?

I have no hesitation in presenting to the readers of the MINING PRESS in connection with the subject of our gold mining geology in brief as far as I can, what is known from the public Geological Surveys on the subject of the extent of the gold-bearing slates and accompanying rocks of California.

P. T. Tyson, in a report to the Secretary of War in 1849,* described the principal lithological characteristics and the physical relief of the Sierra Nevada's gold-vein bearing slope. Wm. P. Blake and others* in the Pacific Railroad reports dating down to 1862, and the members of the Geological Survey of California since 1860, besides various travelers and contributors to the United States records of the Bureau of Mining Statistics, and to the mining journals of the day have added to the general knowledge on the subject; a summary of which is given in the accompanying sketch, showing besides their relation to older rocks the geography of the slates, etc., as perfectly as delineated by the State Geological Survey, on one of Holt's large maps, colored by Prof. Whitney and exhibited at his request by the writer to the Governor and Legislature a year ago.

The unshaded white in the accompanying diagram represents the ocean bottom, of to-day, along shore; the lightest shading not cross-hatched, the palaeozoic shore bottom in the early or dark ages of geology; the lightest cross-hatched, the land, or the Pacific coast of that period.

Silurian, devonian and carboniferous fossils brought by Mr. Clayton and others, from Silver Peak and other points lithologically related in Nevada, have determined for us in general terms, the great fact as represented.

The intermediate one between the lightest and darkest shadings of the sketch, is the ones which concern us most. It represents in general the area of the auriferous slates. A portion of this shading, it will be observed, is done by lines sloping down towards the left; this represents the off shore or deep sea mud which washed down from the palaeozoic or ancient shore in the middle-age or Reptilian period of geology that next followed the Palaeozoic time, or age of fishes.

The area so shaded was dotted by islands

from which came the conglomerates we find interspersed here and there in the slates—or muds as they were.

Another portion of the same general tint, it will be observed is shaded by lines sloping down towards the right; this and the last mentioned having a close relationship to each other. This is the area of predominating granite which was once probably pretty generally

we should not find it difficult to hit upon the precise method of granitic uplift whereby the off-shore mud-strata became shaped into a dome of unparalleled sublimity, presenting to our view a base or section of 70 miles, and an altitude of 8,000 or 10,000 feet.

The relation of this mesozoic formation to the palaeozoic shore becomes obvious from the diagram. The granite island centers as they

DIAGRAM REPRESENTING THE GEOLOGY OF THE GOLD BEARING SLATES, viz: The Areas of the Palaeozoic (Ancient or Primary); the Mesozoic (Middle Ages or Secondary); the Cenozoic (Geologically Modern or Tertiary); and Present Shore Bottoms.

covered by slates—which were accordingly subjected to all the vicissitudes attending the uplift of a granite mountain core, that of the Sierra Nevada; showing only spots of slates, as represented. The slates are mostly gone; they

were then in the axis of the Sierra Nevada, before the uplift of these beds, had the same relation to the Pacific shore of the period that the granite Farallone islands have to the Pacific shore of to-day.

would naturally have been less thickly hedged so close to the middle age shore.

Between the Oroville table mountain and Piety Hill (near Shasta City) gold mining districts, the slate or gold formation sags into, or crosses, Sacramento Valley, and is partly cut off, partly only exposed by the deep erosions of the upper Sacramento; being covered at the surface throughout this fifty miles of distance by a broad sheet of lava from Lassen and Shasta peaks, the tabular cliffs of which as plainly seen from the railroad, designate the shore line where these lavas broke into the Pliocene sea.

That the slate forming muds were deposited in pretty deep water throughout a long period of time, we have good reason to believe, from their consistency, and from their vast thickness. No careful geological measurement of the thickness in feet has ever been attempted with satisfactory results. Yet it would seem that in the extreme simplicity of the regularity of the hedding of the slates as here indicated along the entire western slope of the range,

It will be observed that the axes or efforts of uplift developed a form like this. A valley was formed opening northward like Eel and Salinas rivers, as if intended to connect with the Klamath (see the striking identity of axis) and drain into the ocean at its mouth. But the Siskiyou mountains near Weaverville developed a split or spur more to seaward,—in sympathy with the Monterey and San Francisco granitic arms from the Tejon; thus laying the foundation for the future topography of the great California valley, a valley of depression.

The extensive (scarcely explored) volcanic plateau of Shasta and Lassen peaks extending to Goose Lake, (the Modoc's country) represented by the letters A E F, owes its origin primarily, perhaps, to the manner in which these forces of uplift affected that inter-montane

area. Ages later, in the Tertiary when the Pliocene rivers were scooping out their treasure chests for the hydraulic miners that are now at work in them, and when the great valley of California was not yet dry land, there were further changes of level, interesting to consider in connection with this plateau—the history of which, as read in the Pliocene gravels, is only the later history of the auriferous slates. Belonging to surface geology, however, I will not follow in this connection, the story of the slates any further.

It will be next in order to consider the auriferous contents of the Slates: the veins gashes, chimneys, nests, gutters and beds, etc., in which gold has located itself, in association, in each case, with certain families of minerals; which are perfectly recognizable, and peculiar to the districts from which they come.

*To be found in the State and Mercantile Libraries.

Seattle Coal.

A new vein of coal has lately been discovered on Cedar River, which empties into Washington Lake near Puget Sound. The vein is from nine to ten feet in width wherever it has been opened or crops out. The parties owning the ledge have a charter for a narrow-gauge railroad to Seattle, 16 miles distant, and propose to open the mine systematically as soon as they are able. Seattle coal is in demand in this city and retails at about \$16 or \$17 per ton. These parties think they can sell it here at \$5 per ton. Coal ought really to be sold here at not more than two or three dollars per ton more than it is in the East, which would greatly benefit our manufacturing interests.

This vein of which we speak is about six or eight miles from the Seattle Coal Company's mine and in the same coal field. It crops out 80 feet above the Creek near by, and also crops out on a level with the creek. Other coal croppings have been found in the vicinity but this is the largest and most important as far as known. We are glad to know that efforts are being made to furnish coal to this city at lower rates than at present charged. We know of nothing which would benefit us more, and hope that capitalists will turn their attention to the mining of this most essential article, which will not only be very profitable to themselves but will help build up the industrial and manufacturing interests of the city.

A NEW DISCOVERY OF MARBLE.—A correspondent writes us from Camptonville that Messrs. Peter Butts and James Dimond, of that place, have discovered and located a very fine ledge of marble. The ledge is said to be large and well-defined, and some very fine samples have been brought into town for exhibition. The marble is nearly white and susceptible of receiving a very fine polish, and will probably be found pure white as the ledge is opened deeper.

There appears to be a heavy ledge of marble running through the country, for thirty miles or more in length, crossing the Feather River, below Strawberry Valley and the Yuba, above Emery's old crossing.

COAL MINERS' STRIKE.—As was expected a few weeks since, about 70,000 men have "struck" in the coal mining districts of Wales, for an increase of wages. Many of the mines have suspended operations. Coal is at famine prices, and the effect is being disastrously felt all over England.

AGASSIZ INSTITUTE.—Prof. Gilman has consented to lecture before this Association, in Sacramento.

CORRESPONDENCE.

Quartz and Gravel Mines in El Dorado County.

[Written for the Press.]

After an almost unprecedented cold snap, causing a suspension of mining—where any considerable quantity of water was required—by the freezing up of canals, ditches and streams of water, the weather has moderated and at this time—Dec. 25th,—we are having a fine warm rain, and the indications are that the storm will continue for several days. The cold dry fall has given the miners a fine opportunity to prospect, both quartz and gravel mines. El Dorado county is certainly taking a step forward in prospecting and working her quartz veins successfully. The

St. Lawrence Mine and Mill

Situated in Kelsey Township, north side of the South Fork of the American river, is a most excellent mine and mill, and they are running full time on from \$20 to \$40 rock. The main shaft is down about four hundred feet, and the ledge has been widening for the last two hundred feet, and is now some six feet in width. I am told that the gross receipts are about \$1,200 per each 24 hours. Col. D. E. Buel and Ike Bateman are the reputed owners of five-sixths, and—McNevens the Superintendent of the works, one-sixth of this valuable property.

The Isabel Mine and Mill

Situated northwest, and about half a mile from the St. Lawrence is claimed to be valuable; the vein being over four feet in width at a depth of 50 feet. Rock from this vein that has been milled, has paid \$39 per ton. The ledge has been traced two thousand feet. The Isabel is an incorporated company of which C. W. Brewster of this city is one of the principal owners.

The Dolly Varden Mine

Situated in the vicinity of those mentioned above, was discovered by McKinstry & Co., last summer and sold to Bennett & Co. of Sutter Creek, for a few thousand dollars, is now held at high figure and probably could be sold for as many thousands, as Bennett & Co. gave hundreds for it. There is no doubt of its permanency, as it has been prospected to the depth of 130 feet.

The Gopher Mine

Is situated in Kelsey Township not far from those spoken of, and is owned by citizens of Coloma and Napa. It has been sufficiently tested to warrant the belief that it is a valuable mine, but I am informed that the manner of prospecting has been to follow the vein on the surface rather than drive a shaft into the ground. Rock that has been taken from this vein and milled has yielded \$30 per ton. No richer placer mines have been found in the State than those known as Rich and Irish flats, in the immediate vicinity of the quartz mines I have spoken of. From my own knowledge, immense quantities of gold were taken from Rich and Irish flats, and Irish Creek, in Kelsey Township during the years 1851-2-3-4-5.

A San Francisco and New York Co.

Own some three thousand feet, commencing near the South Fork of the American river and extending north towards the St. Lawrence, but nothing has been done of late by this company on the vein. There are several other locations of quartz leads in this vicinity which I may notice hereafter, if subsequent developments warrant me in so doing.

The Cedarberg Mine,

In Greenwood township, I am informed, continues to be a paying institution. I am also informed that Ex-Senator Hunter, Mr. Sempers and their associates have struck the old porphyry or decomposed quartz lead, from which enormous quantities of gold were taken in 1851-'2 and '3; and an occasional strike has been made since that time. This claim is west of the Cedarberg, in Spanish Dry-Diggings district. Many thousands are reported to have been taken out of this claim by its present owners, within the last few months. There are a number of valuable quartz mines in Georgetown township—of their doings and prospects I am not posted. Senator McKusie has a fine ledge at Volcanville, six miles from Georgetown, which prospects remarkably well. He has about a thousand tons of quartz at the dump, ready to mill; but a scarcity of water, during the summer, has prevented mill-work.

Quartz in Mud Springs Township

Is receiving considerable attention, and business of all kind feels the influence of large and profitable mining operations there. Several large amounts of gold have been taken from porphyry claims in that township during the past summer and fall.

Quartz and Other Mines within a Radius of three miles of the Court House in this City.

Within one thousand feet of the main street of this city, Shephard & Whitten have located and are now prospecting a quartz ledge. It was discovered in a ravine below the County Hospital, and traced south over the hill in the rear of the Episcopal Church to Hangtown Creek. The locators sunk a shaft at the creek

twenty-five feet deep, and have now commenced a tunnel, following the vein, which is over five feet in width, and carries gold more or less in all the rock, although the hanging or under sides of the ledge is the richest. Not a pound of rock when pulverized and washed but shows more or less gold. The claim is considered valuable.

The Gross Mine,

Which was discovered last summer on Poverty Point, about one and a half miles north of the Court House in this city, from present indications is a remarkable rich mine. The vein is some four feet in thickness and is well defined, a tunnel having been driven in from one of the gulches that put down from the point, several hundred feet, being some three hundred feet below where the ledge crops out at the top of the hill. About four tons of the rock was taken to the Oregon Hill mill, and crushed last week, which yielded one hundred and fifteen dollars per ton. Gross has a hundred tons or more of rock which he intends to have crushed. The rock has to be packed to the top of the hill on mules, and then dumped into wagons and carted to the mill, two miles from the mine. I saw the gold which was taken from the rock crushed at C. W. Brewsters. I have been told that \$40,000 currency has been offered for this mine, by a New York Company.

True & Son have a vein south of the Gross lead, which I am informed has been bonded to some San Francisco gentlemen, for a pretty round sum. The

Oregon Hill, Mine and Mill

Has passed into the hands of Blair, Brewster and Lemon. Active operations have been resumed, and new developments thus far indicate a good mine.

The Excelsior Mining Claim,

Situated at Coon Hollow Hill, is probably one of the best hydraulic claims in the State. It has paid large dividends for the past two years—although knowing the amount, I am not at liberty to make it public—with only a limited supply of water. Two thousand inches of water could be used at much greater advantage proportionately, than two or three hundred.

Ames & Co.

Near the Excelsior claim have a hydraulic claim; they also have a ten-stamp water power mill, for crushing cement and gravel taken from the same claim. Their mill has yielded well since it was put in operation last fall.

Dickeroff & Goodyear's Gravel Mill

Has now been in operation some three years. Water for operating mill, and to use in batteries costs them 30 cents per hour, ten stamps of 450 lb each; capacity of mill is from 60 to 70 tons of gravel in 24 hours. The gross product of this mill had been from \$500 to \$1,800 per week since it commenced running, of which—I am informed—more than one-half is clear profit. Blacklock & Co.'s claim on Spanish Hill, has been paying well; also the Hook & Ladder claim, adjoining Blacklock & Co.'s claim owned by John and James Blair. About one year ago a large quantity of powder was exploded under the hill, shaking up the ground 160 feet in depth. They inform me that a like operation will be performed the coming spring. This claim has paid large dividends to its owners. Robinson & Co.'s mill, at Prospect Flat—steam power—has been in operation most of the time for the past three years, crushing gravel obtained near the mill, some 100 feet beneath the surface. A new shaft was lately sunk and a lead of gravel struck which is estimated to be worth, at least, \$40,000 to the owners.

The Granite Claim,

At Smith's Flat, owned by a San Francisco Co., of which I. I. Holmes is managing agent, is known to be a valuable claim, and great profits are expected from it, when it is properly drained and in working condition.

The Deep Channel Claim

Adjoining the Granite, owned by Creighton & Co. is also a valuable claim and has for a number of years paid large dividends. Creighton & Co. have a water power mill, eight stamps, for crushing the gravel that does not yield readily to hydraulic washing. Jess & Co., Crumson & Co. and several others have claims on Smith's Flat of which I have no time to make suitable mention. Hancock & Solter on Reservoir Hill have a valuable hydraulic mine, which is worked winters only. Ward Brothers have a remarkable rich streak of gravel at White Rock Cañon; they have a small water power stamp mill—five stamps. The gravel yields from \$20 to \$40 to the car load. This claim has made fortunes for four or five brothers, two of whom have gone to their former homes in the Eastern States and settled.

A Bedrock Flume in the Creek, or a Tunnel Through the Hill.

Last spring the City Council granted to Thomas Alderson—one of the owners of the South Fork Canal—a franchise of putting a bedrock flume in Hangtown creek through the city. Estimated cost of flume between \$40,000 and \$50,000. This work if completed would be a profitable investment, providing there was sufficient room for dumpage at the outlet of the flume. When it is considered that in a few years—if our supply of water is increased, which it must be within two years—that nine miles of hill, in some places three hundred feet high, is to be washed down and run through this flume—if it is built—it will readily be discovered that there is not sufficient room in Hangtown creek below the city to deposit the

debris thus sent through the flume from the working of the mines above.

To obviate the depositing of the enormous amount of earth and stone, to be washed down from the hills into the creek, and thus overflow the city,

Robert Patten, Engineer

Of the South Fork Canal, has conceived the plan of an outlet into Weher creek, by means of a tunnel some 3,000 feet in length through Hangtown Ridge, commencing at or near the Excelsior mining claim. This would give a dumpage of more than one hundred feet fall and all the bed of Weher creek for five miles as a receptacle for all the debris from the hill and claim above; besides, the heavy rains of winter swell this creek frequently to the size of a river, which would annually wash away such deposits as would have accumulated during the other seasons. Again, such a tunnel would drain all the claims along this ridge spoken of above—and some twenty not mentioned—but more particularly the Pacific quartz mine, Deckeroff and Goyan, Cedar, Prospect and Smith's Flats, which would be of incalculable value to the owners. The estimated cost of such a tunnel, all complete, ready for use, is \$60,000. The yield of gold from claims that would use this outlet, would not be less than a million of dollars per annum, might be two or three times that sum. A plat has been drawn of the tunnel, the line of the present canal, which runs along the ridge, the claims that would be benefited by it, and submitted to the officers of the South Fork Canal Company. Several others have been made by persons interested in mining on this ridge, to procure the necessary funds to construct the tunnel, but none have been accepted. E. N. SMOOT.

Placerville, Dec. 25, 1872.

Tintic District, Utah.

EDS. PRESS:—Owing to unforeseen circumstances I have been unable to fulfill my promise of a few weeks ago, until the present time. As mentioned in my previous letter "Diamond City," one of the mining camps of this district, is well worthy of note, from the excellency of its mines, and will at no distant day, rank with any of its sister cities in Tintic. It would take up too much space were I to enumerate the different leads separately, and therefore, will only give you a brief sketch of a few of the most prominent ones.

The Undine is a fine, rich lead owned by the Jackson brothers. No large amount of development has yet taken place. A shaft has been sunk down some 60 feet, following the ledge all the way, and a considerable amount of first-class pay ore taken from it. The lead is well defined and the ore paid well from the surface. Another shaft is about being sunk and from present indications, will prove very profitable.

The Joe Bowers, a claim owned by the Wendigo Company, of Lake Superior, is looking well; three shafts have been sunk to a depth of 100 feet. Very little work has been done upon this mine the past fall, but they are now preparing to proceed vigorously with the work of its development. Assays from the ledge show from \$25 to \$500 ore.

From the Jefferson a considerable amount of silver bearing quartz has been taken, and the prospects are flattering for a further increase. This lead is at present idle. The owners are, however, making preparations for the resumption of work at an early date. They have a shaft down upon the ledge 100 feet.

The Washington has a shaft 140 feet in depth with several drifts opened, and furnishing large quantities of milling ore which is accumulating upon the dump and ready for reduction as soon as the mill, now being erected, is ready to start. The vein is about four feet in width, encased in granite walls. All of the above mentioned mines are in granite formation.

The Morning Glory is a promising mine, ranking second to none in this district. It is located about three miles southerly from this place. The claim extends 3,000 feet in length, on a well defined vein of silver-bearing rock of free milling ore. It also carries some little copper.

The mine is thus far opened by two shafts, being respectively 78 and 120 feet deep. Two drifts have been run on the vein for from 15 to 20 feet each, and from which large quantities of ore have been extracted and forwarded to mills in East Cañon for reduction.

The shafts are distant from each other about 300 feet. When commencing to sink, the vein was three feet in width, with two regular firm walls, proving itself to be a true fissure vein. At a depth of 25 feet the vein enlarged to such an extent that the shaft was sunk in nothing but one mass of ore, and its present depth, 110 feet, the width of the vein is still unknown.

The character of the ore is a yellow and brown chloride, intermixed with a dark decomposed quartz, which, for mill reduction is very desirable, it being a free milling ore.

The ore taken from this mine has been shipped a distance of 40 miles to East Cañon for reduction, yielding from \$80 to \$135 per ton. A large quantity of second class ore is now piled up upon the ground, waiting for reduction by one of our new local mills; this class of ore will yield about \$44 per ton.

The bearing of this lode or vein is north and south, dipping west about 18 inches in 6 feet.

The vein is imbedded in granite formation. It is easy of access, and a desirable property for its owners. Work has been but slowly prosecuted upon the mine, owing to the inability of its owners to procure the necessary improvements required to work such a mine successfully. C. F. J.

Silver City, Utah, Dec. 1872.

The Seattle Coal Mines.

The coal deposits of Washington Territory are known to be very extensive, but for want of capital only those at Bellingham Bay have been mined to any great extent, but within the past three years the Seattle Coal Mines have been opened, and the production is rapidly increasing. The following extracts from a private letter written to us by a valued and reliable contributor at Seattle, Washington Territory, give some interesting information regarding the mines:

"The Seattle Coal Company is a stock company organized under the laws of California; office at San Francisco. The mine is located seventeen miles from Seattle, and four miles is railroad (narrow gauge); balance of distance is by water over lakes Union and Washington. They are taking out an average of 80 tons per day; employ about 120 men, two steam tugs, two large barges, one steam engine, 40 horses and 160 two-ton cars. The coal is conveyed from the mine to vessels at the port without change of cars. Last year they mined 15,000 tons, 10,000 of which was shipped to San Francisco. This year they have taken out 35,000 tons, and 25,000 tons shipped to San Francisco. Is now worth there \$12.50 per ton. The expenses are as follows: \$3.50 per ton to mine it and put it in ships at Seattle; \$5 per ton for freight, leaving a net profit of \$4 per ton, or 30 per cent. Mr. Charles J. Shatwick is Superintendent, and resides here, the other owners of the stock live in San Francisco and New York. The demand for coal is said to be steadily increasing. The mines are very large, in fact the different mines on this Sound now known would supply the United States for fifty years. It is a second Pennsylvania for coal and iron, but it requires capital to work them. This company have not capital sufficient to run it as it should be. If they owned their own ships they could save or make for themselves 40 per cent. more by proper outfit then coal could be placed in ships at \$2 per ton."—*Commercial Reporter, Oregon.*

The Champion Numismatist.

It may not be generally known that Dr. Charles Spier of this place is the oldest living and most successful numismatist in the world. He has been engaged in the collection of coins for over fifty-seven years and has now over 14,000 pieces, representing every species of coin ever produced in any year or under the dominion of any sovereign or Government from the days of Semiramis and the Pharaohs down to the present time. His collection is worth hundreds of thousands of dollars. He has over 10,000 of his pieces in the vaults of the Bank of California, and 4,000 or over here. At the Bank of California his collection is pronounced the best and most valuable in existence, not excepting those of Queen Victoria and the Sultan of Turkey, which are particularly extensive and valuable. A few days ago we examined the 4,000 of his pieces which he keeps here. They proved a most interesting study. Coins of the ancient Jewish Kingdom, of the various kings, consuls and emperors of Rome, Tyre, Sidon, Carthage, Nineveh, Babylon, China, Palmyra, Egypt, Japan, etc., with specimens of every year's coinage in all Christian lands from the time of Constantine till now, were exhibited in prodigious profusion. The Doctor has many coins which would sell for many thousands of dollars each. His collection has been the work of a very extended lifetime. He has traveled nearly all over the world and is constantly receiving new additions to his pieces from Europe and the East. He has gold and silver coins from the size of a very large teacup down to that of a pea. We wish we had the space to particularly describe them. The Doctor, who is in easy circumstances and greatly advanced in years, though still robust for one of his age, remains in Visalia on account of the excellency of the climate. His collection is very interesting to any one appreciating the mementoes of antiquity.—*Visalia Delta.*

UTILIZING ABALONA SHELLS.—Sixteen tons of abalona shells have been ordered from this coast by two firms, one in Boston and the other in Philadelphia. They are used for manufacturing into buttons and many kinds of fancy articles and bring good prices. The islands opposite to this county are literally covered with the finest shells for this purpose found in the world. Why are they not utilized? On the shores of Anacapa or Santa Cruz, a few men could soon load a schooner.—*Ventura Signal.*

SCIENTIFIC PROGRESS.

Electricity.

We are seemingly but little nearer a true solution of the nature of electricity now, than Franklin was a hundred years ago. Modern physicists have pretty generally concluded that it is only another form of motion, but this is only shifting the difficulty one step farther back; for who can define motion, or rather force, of which motion is the visible manifestation? Although we cannot define its nature, we are able to understand it far more fully, and to measure its effects and control its manifestations more successfully, than was thought to be possible at that earlier day. So many new terms have been introduced into this department of scientific research within a few years, that we think it may be of interest to our readers to define a few of these. The non-professional reader is sorely puzzled when he meets with such uncouth words as *volt*, *ohm*, and *farad*, or sees mention of primary and secondary currents.

The *primary* current is the current flowing directly from one element of a galvanic battery to the other.

The *secondary*, or *induced* current, is the current of electricity that is induced in a coil of insulated wire, when a magnet is suddenly introduced into its interior. It is also produced by revolving the armatures of electro-magnetic machines, by the Ruhmkorff coil, and in many other ways. Faraday was the first to study it.

Dynamic electricity is that produced by the galvanic battery, as manifested by the primary current. *Static* electricity is that produced by friction, and by the induced current in the Ruhmkorff coil. The two differ mainly in tension. By tension is understood the power of overcoming obstacles. Thus, static electricity will pass through the air for considerable distances, as is seen in the discharge of a Leyden jar, or a stroke of lightning. But dynamic electricity is rarely produced of sufficiently high tension to pass through greater thickness of air than a fraction of an inch. The quantity of electricity that is concentrated into a single instantaneous flash in lightning is spread out over hours in the battery, and is consequently weakened in intensity, though the quantity remains the same.

A simple illustration may serve to make the difference more readily understood. If a ball of lead weighing ten pounds were dropped upon a man's head from a height of sixteen feet, it would most likely injure him seriously. If, however, the ball of lead were converted into shot of a grain weight each, and these were allowed to fall in a continuous stream until the whole ten pounds had fallen, they would be scarcely noticed.

The standard of the resistance of bodies to the passage of electricity is called an *ohm*, from the name of the man who investigated the influence of resistances on electric currents. One ohm is equal to the resistance of 48.61 metres of pure copper or silver wire one millimetre in diameter, at the temperature of 65° F. When, therefore, a resistance of a thousand ohms is spoken of, we understand that a certain circuit opposes a resistance a thousand times as great as this to the flow of the current.

The *volt* is the unit of tension, and is so called from Volta. It is about equal to the electromotive force produced by one Daniell's cell. Thus, two Daniell's cells coupled for intensity would have an electromotive force equal to two volts. A Bunsen cell has an electromotive force equal to about 1.8 volts.

A *farad*, so named from Faraday, who investigated the relations of electrical quantity, is the unit of current.

The question is often asked, How can a telegraph operator, sitting in his office, tell within a few feet where a break in the wire is, or rather where it makes a connection with the ground? The operator knows the resistance of his wire per mile. Suppose, for instance, that it is fifty ohms. Now in the first place, he connects his battery with the wire, and also puts into the circuit a rheostat and a galvanometer. A rheostat is an instrument so constructed that a greater or smaller amount of wire or resistance can be readily introduced into or removed from the circuit. Having adjusted the rheostat so that the needle of the galvanometer points to a certain division, the wire is removed from the circuit, connection being made directly with the rheostat and galvanometer, instead of through the line and the earth. Suppose it is now found that more resistance must be introduced into the rheostat, in order to bring the needle to the same place; for instance, we have to introduce 500 ohms. The break must then be ten miles away; for the resistance of the earth is zero, and the additional resistance introduced must just equal that of the wire removed. In practice, the apparatus employed is a little more complicated than this, but the principle is the same.—*Boston Journal of Chemistry*.

RED LEAD GLASS UNFIT FOR INSULATION.—Prof. Henry Morton, in a recent lecture before the N. Y. Polytechnic Institute said that red lead, although one of the best of non-conductors, will render glass a very good conductor, if it enters into its composition. Such glass, which is usually of high refracting power, and therefore brilliant in appearance, is utterly unfit for purposes of insulation. This fact is of much importance to such as have to do with the construction of electrical apparatus.

THE SPECTROSCOPE.—A correspondent of the *Scientific American* says that notwithstanding the spectroscopic is regarded by scientists as the most wonderful instrument of the age, and is doing more than all other instrumentalities to-day for the advancement of astronomical science, it does not tell the same story to all observers. The same light does not prove to be composed of the same substances when different men and instruments are employed. For example, to Prof. Young the corona seen during the eclipse of the sun is a permanent aurora, and deemed by him electrical in character; to Prof. Harkness the instrument suggests that the appearance is not in the nature of an electrical discharge, and its light not polarized, but that this mystical aureole of the source of light is incandescent hydrogen gas with vapor of iron. I could name many operators with various results.

RAINDROPS AND RAINBOWS.—According to Kolbe, the size of the drops in a rainstorm essentially modify the character of the rainbow that may be formed. He shows this by a quivering apparatus, which produces three kinds of drops simultaneously: the first, large and easily recognized as drops; the second, small, and whirling at first among each other, then falling in parallel directions to the ground; the third, very fine, and forming thin clouds of spray, which rise in the air. In the last no trace of a rainbow can be observed, even in a darkened chamber into which a ray is admitted; the second kind gives a bow (blue and orange), distinctly visible, at a distance of three feet, but more distinct where the drops fall parallel than where they whirl together; the large drops give a bow with much livelier hues.

COPPER IN COCOA AND CHOCOLATE.—M. E. Duclaux, who recently ascertained the existence of a small quantity of copper in cocoa and chocolate, gives as the best method to determine its presence, the precipitation of the metal in a platinum capsule by the action of tin. If a series of determinations are made the capsules increase in weight. The variation of a capsule of 15 gms. may exceed 3 milligrams. In one experiment he detached a grayish-black substance weighing 30 milligrams, which he recognized to be spongy platinum, produced by the occlusion of hydrogen. The barks of cocoa were found to contain as much as 0.025 per cent. of copper. Less quantities were found in the kernel.

SELF-PURIFICATION OF FLOWING WATER.—Concerning the rapidity with which contaminations are got rid of by flowing water, Dr. Letheby asserts that sewage impurities will entirely disappear in a flow of a dozen miles. If, he says, ordinary sewage, containing say one hundred grains of solid matter to the gallon, of which solid matter probably something like fourteen or fifteen grains will be organic, be mixed with twenty times its bulk of ordinary river water, it will not contain, after a flow of ten or twelve miles, a particle of that sewage discoverable by any chemical process. Dr. Parkes also believes that flowing water thus purifies itself, but he does not undertake to say how far it must run to make the process of purification complete.

TENDENCY TO CRYSTALLIZE.—There has been noticed a singular tendency in old silver ornaments and coins to become crystalline and friable. An ancient fibula was found in the island of Cyprus, and supposed to be at least 1500 years old, which, through the greater portion of its substance, presents a fracture something like that of cast iron, and its specific gravity has been reduced in round numbers from ten to nine. It contains a little copper. This property of certain metals or their alloys to change in condition and volume is worthy the attention of those whose duty it is to make our standards. Experiments should be instituted for the purpose of learning what metals or combinations of metals are least subject to this change.

SELF-PURIFICATION OF FLOWING WATER.—Concerning the rapidity with which contaminations are got rid of by flowing water, Dr. Letheby asserts that sewage impurities will entirely disappear in a flow of a dozen miles. If, he says, ordinary sewage, containing say one hundred grains of solid matter to the gallon, of which solid matter probably something like fourteen or fifteen grains will be organic, be mixed with twenty times its bulk of ordinary river water, it will not contain, after a flow of ten or twelve miles, a particle of that sewage discoverable by any chemical process. Dr. Parkes also believes that flowing water thus purifies itself, but he does not undertake to say how far it must run to make the process of purification complete.

ORGANISMS IN CRYSTALLINE ROCKS.—Dr. Jenzsch, of Gotha, who has devoted himself for some years to microscopic lithology, announces that in various kinds of crystalline and volcanic rocks he has discovered minute animal forms in prodigious numbers in a fossil condition. Among them he finds infusoria and rotifers intermingled with algae, and he infers their formation in a large expanse of stagnant water.

SPECTRUM OF THE AURORA.—Vogel has determined that the spectrum of the aurora may with great probability be regarded as a modification of the air spectrum, the variability of the spectra of gases under different circumstances of temperature and pressure being well established.

MECHANICAL PROGRESS.

The Laws of Combustion in Steam Furnaces.—How to Render Combustion as Complete as Possible.

The *Engineer* condenses from the *Journal of the Royal United Service Institution* the following very interesting paper by M. T. S. Prideaux, who has for many years labored energetically to secure efficient combustion in steam-boiler furnaces. The subject is one of much importance to every one who employs steam-power. Mr. Prideaux, after a few general remarks, proceeds substantially as follows, as we copy from the *Engineer*:

When a pound of carbon is completely burned it liberates 14,500 units of heat. In other words, 1 lb. of carbon so burned liberates heat enough to convert 15 lb. of water into steam. In practice it is quite impossible to burn the 80 per cent. or so of carbon which coal contains at one operation. When the furnace is charged with fresh cold fuel it will not burst into flame all at once—on the contrary, it undergoes a species of distillation. Ordinary coal may be regarded as containing 80 per cent. of carbon and 5 or 6 per cent. of hydrogen in chemical combination with the carbon, and at low temperatures—less than 800 deg.—the hydrogen escapes in combination with carbon as carburetted hydrogen; but hydrogen at a high temperature unites with eight times its weight of oxygen; the result is, that the combustion of 1 lb. of hydrogen liberates about 60,000 heat units, or four times as much as a pound of carbon. Unless eight pounds at least of oxygen are supplied to each pound of hydrogen, the carburetted hydrogen gas does not burn at all, however high the temperature, but flies up the chimney with a resulting waste equal to about 15 per cent. of the whole fuel.

Turning now to the carbon, we find that, if enough oxygen be supplied, that is to say, 2½ lbs., or 12 lbs. of air per pound of carbon, and if the temperature be sufficiently high, we have complete combustion, the resulting product of combustion being 3½ lb. of carbonic acid. But this perfect combination can never be secured at once. A portion of carbon next the fire-bars unites at once with the required quantity of oxygen, and the resulting carbonic acid, in ascending through the green fuel above it, dissolves carbon; 3½ lbs. of carbonic acid resulting from the complete combustion of each pound of carbon next the grate-bars dissolves another pound of carbon, and becomes converted into carbonic oxide, sacrificing, in doing so, 5,700 units of heat. Each pound of carbonic oxide then represents 14,500 units of heat due to the pound of carbon dissolved, and 5,700 units of heat absorbed in effecting the solution, or 20,200 units of heat in all. To recover this we must supply each pound of carbonic oxide with 2½ lbs. of oxygen when it burns with a blue flame and gives out all its heat.

It will be seen from this that by wasting the carburetted hydrogen and the carbonic oxide we can sacrifice, in round numbers, about two-thirds of all the heat generated. In practice few furnaces are so badly constructed that this result always takes place; but it is also true that under ordinary conditions most furnaces send a great deal of carburetted hydrogen and carbonic oxide up the chimney. The remedy is, of course, to supply sufficient air; but from the very nature of the case it appears to be impossible to do this through the bars. The larger the supply through them, the larger will be the quantity of carbonic acid produced per minute, and the greater the quantity of carbon dissolved and carried off as carbonic oxide. Air must be admitted above the fire as well as through the bars, in order that a sufficient quantity of free oxygen may be supplied to combine with the carbonic oxide and reduce it to carbonic acid. The late Mr. C. Wye Williams, and many others with him, held that it was proper to admit air continuously above the bars to secure complete combustion. In a certain sense Mr. Williams was right, but practically he was wrong; and although complete combustion may be effected with perforated doors, it is well known to every engineer that as a result of the free admission of air over the fire, the steaming powers of a boiler are reduced although the economic efficiency of the fuel is to some extent increased.

The reason is this: The air admitted carries off heat, which ought to go to the water, the temperature in the furnace and flues is reduced, and it is, indeed, quite possible to admit air enough to defeat the object in view, because the temperature of the gases may be so lowered thereby that they will not burn. The great demand for air above the bars occurs just after firing. In the first place, because it is only during the few minutes after firing that carburetted hydrogen is produced; and in the second place, because just then the influx of air through the bars is reduced to a minimum in consequence of the increased thickness of the bed of fuel through which it has to force its way. After the fire has burned clear we are done with hydrogen, and as the fire thins, efficient air will find its way through the bars to secure the combustion of most of the carbonic oxide. Under the best

circumstances it is probable, however, that a considerable portion of this gas escapes unburned; but it is better to submit to this loss than to incur the far greater evil caused by admitting air freely at all times above the bars.

In all that we have just written we have expressed opinions with which Mr. Prideaux coincides, although we have placed the statement of facts in a different form from that adopted by him. We have now to explain how Mr. Prideaux applies his knowledge in practice. It is well known that a great number of inventors have devised schemes for admitting air above the burning fuel for a limited period, varying, say, between one and five minutes after firing. The great difficulty to be contended with is the inherent roughness of the conditions under which stoking is effected. It will not do to leave the regulation of the air admission to the stoker, as has been abundantly proved in practice; nor can any delicate combination of automatic mechanism be trusted to remain in order for any time in the dust and heat of a stovehole.

For about twenty years Mr. Prideaux has labored to produce some device which will get over these difficulties, and we think we can say, after a personal and careful examination of his apparatus, that he has been in the main successful. A portion of his paper in the *Journal of the Royal United Service Institution* is devoted to a description of his apparatus, which may be condensed as follows:—To the inside of the fire-door is fitted a perforated false door. The space of a couple of inches between the two doors is closed at the bottom and two sides. The top is fitted with a light flap of thin iron. When this flap is raised air rushes down between the doors and through the perforations in the inner door into the furnace. When the flap is shut down, no air can enter the furnace save between the fire-bars. The door is fitted with the simplest conceivable device, by which, whenever it is fully opened—as for firing—the flap is thrown up and air admitted. In order to retard the falling of the flap, a little mercury cataract is fixed on the top of the door, and the time during which air is admitted is determined by the rate at which the mercury can escape from the under to the upper side of a cup. As this cup fills, the air admission flap sinks and cuts off the supply of air. There is nothing about this apparatus to get out of order, and we are unable to see how anything can be simpler or better suited to the object in view. The apparatus has been tried on a very large scale in the steamship Republic, with results of the most satisfactory character.

We believe he has solved a difficult problem, in a way upon the whole satisfactory. We know by personal observation that he has completely succeeded in preventing smoke under difficult circumstances, which is perhaps no remarkable feat; but he has done more than this, for he has succeeded in effecting a considerable saving in fuel as well without reducing the evaporative efficiency of the boiler. This is a point of very considerable importance, as we have shown. Mr. Prideaux has brought a thorough knowledge of his subject to bear in working out the details of his invention, and this is no doubt the reason why he has obtained satisfactory results from it.

Metal Paper-Hangings.

Paper-hangings of tin-foil, a recent invention to which we have already alluded, seem to be gaining favor in Europe, and bid fair to secure a much more general use and wider application than was at first anticipated. *Chamber's Journal*, in alluding, to this improvement, says:

The sheets are from 30 to 40 inches wide and about 16 inches long. They are painted and dried at a high temperature, and are then decorated with many different patterns, such as foliage, flowers, geometrical figures, imitation of wood, or landscapes. When decorated the sheets are varnished, and again dried, and are then ready for sale. Tin-foil is in itself naturally tough, and the coats laid upon it in preparing it for the market increase the toughness. The hanging of these metallic sheets is similar to paper-hangings, except that the wall is varnished with a weak kind of varnish, and the sheet applied thereto. Thus, in this way, a room or house may be newly painted, without any small of paint to annoy or harm the inmates. Moreover, tin-foil keeps out damp, and as the varnish is a damp resister, the protection to the room is two-fold.

Experience has shown also that cornices, moldings and irregular surfaces may be covered with the tin-foil as readily as the flat surface; hence, there is no part of a dwelling house or public building which may not be decorated with these new sheets; and, as regards style and finish, all who saw the specimens exhibited at the reading of the paper were made aware that the highest artistic effects could be achieved at pleasure. The decoration of small tin plate for ornamental purposes has, we hear, been introduced into Cornwall—the county of tin. In this case, the color and pattern are printed on the plate by means of lithographic stones and rollers; but, to insure excellence and permanence, the plate must be heated. Difficulty was first experienced in keeping the plate at the required temperature, the upper part of the oven being always hotter than the lower; but it was overcome by fitting into the oven a vertical roundabout, which carried the plate from top to bottom of the oven during the whole process of heating. We think there are many purposes to which the plates could be applied beyond that of mere ornament.

THURSDAY, Jan. 9th, 1873.

seen prior, at least the increase will be still

greater. Its assistance to quartz mining is too well known to need comment, and it has materially aided in developing our mines throughout the Coast by facilitating bleating operations, and thereby increasing the yield of gold.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

WOLVERINE.—Calaveras *Chronicle*, Jan. 4. The main shaft of the Wolverine is now about 270 ft. deep. The vein, in bottom, is 4 ft

Countees and Democrat which their level cuts, pay better and the veins are larger than on the surface. The Democrat, which they are now working, was not supposed to be worth

WOLVERINE.—Calaveras Chronicle, Jan. 4

ledge with a vein on either side running parallel, and in no place are they more than 20 ft. apart. Mr. McKeadney and Col. Rand are the only miners who have gone down to any con-

only miners who have gone down to any considerable depth on this hill, and both have

proved the fact that the quartz in this belt of ledges never ceases to carry gold, but on the contrary get richer as they go down. Mr. McK. has now in successful operation steam hoisting works 100 feet below the surface. In a few months he contemplates moving his mill immediately on the mine.

NAPA COUNTY.

WHITTON.—Cor. from Yountville to the Napa Register: This mine is located about 7 miles west of here, near the line between Napa and Sonoma counties and opposite Rutherford's Station. It is 1760 feet above the level of the valley. It was discovered by R. J. Whitton in 1865. A company was organized called the "Summit Consolidated" composed of R. J. Whitton, W. T. Whitton, W. H. Whitton, J. M. Whitton and A. C. McDonnell—all residents of this place. They kept the mine until last summer, when after expending \$11,000 on it, they sold out to Mr. J. Pershacker, the present owner, for \$45,000. Mr. P. has spent about \$25,000 more in improvements, and is just beginning to make it productive, the first shipment of 32 flasks of quicksilver having been recently made. These flasks contain 76 pounds each, and, at present prices, are worth \$64.50 per flask. The old company had produced 262 flasks up to the time of sale, making the total product of the mine thus far, 394 flasks. The present management is working 26 Chinamen, and 14 white men. A south extension of the "Whitton" called the "Overland," was discovered 10 months ago, and has 100 ft. of tunnel run.

NEVADA COUNTY.

MOORES AND WOOLSEY'S FLATS.—Nevada Transcript, Jan. 4: The Illinois claim, at Moore's Flat, is now yielding handsomely. In twelve weeks' run they took out \$14,000, of which \$8,000 was profit. The Eagle Company, at Moore's Flat, having taken out \$8,000. The Oriental, at Woolsey's Flat, cleaned up \$8,000. A chunk of gold, worth \$659 was found in these claims a few days before they cleaned up. The Boston claims, owned by Hagerly & Co., have yielded about \$60,000 this season. The Company has made a contract with Marke & Co., to run 1,500 ft. of bed rock tunnel. The Blue Bank at Woolsey's have taken out \$7,000.

EUREKA MINE.—Grass Valley Union, Jan. 1: The Eureka made a clean up of \$7,000 last Saturday, after a run of 7 days with 10 stamps. The mine is looking very well and considerable prospecting is being done.

GREEN MOUNTAIN.—Jan. 3: This mine, situated on Osborne Hill, is doing very well. The company have had their 5-stamp mill running for a month past, and gold to the amount of about \$5,000 has been cleaned up. The ledge is looking splendid, and some very rich rock was taken out last week.

COE.—At this mine Mr. Hill is at work putting down an escape shaft. That will be 100 ft. in depth making an egress in case of accidents. The Coe shaft is down 450 ft., and in 50 ft. more it is expected that the pay chute will be cut.

EMPIRE.—Jan. 4: The Empire is paying well. We yesterday saw, at Delano's bank a bar of gold valued at \$9,500, which was taken from the Empire mill after a run of ten days. The Empire has produced, within the past four weeks, gold to the value of \$19,500.

GRASS VALLEY.—We are glad to hear that this Co. has struck a good ledge which shows free gold and is heavy with gold-bearing sulphurets.

GREENHORN.—Jan. 7: This mine is doing well. The mill has plenty of water, and is running night and day. Saturday last a rich strike was made in the 3d level, 315 ft. down, and in an hour or two about \$400 worth of specimens were sent to the surface. The ledge in that level is from 12 to 18 inches in thickness. The ore now being milled will pay about \$20 to the ton, excluding picked rock.

PLACER COUNTY.

JULIAN.—Placer Herald, Jan. 4: From Mr. Schnabel we learn that the new twenty-stamp mill commenced crushing ore on Monday last, and works finely, and from the appearance of the plates the rock is yielding well. The ledge and mill are near Newcastle, and are now being worked under bond. It yields low grade but even paying rock. This mine promises to be a second Amador.

PLUMAS COUNTY.

GREENVILLE.—Quincy National: Bidwell & McIntyre have just completed their new 24-stamp mill, and commenced crushing quartz from their mine—the Union—on the 26th ult. They have opened the mine to a depth of 500 ft. Operations in their main lower tunnel have been in progress for the past two years, or nearly so, and it has cost the company \$20,000. The tunnel is 1,425 ft. in length. This insures to the company about 250 ft. of milling rock above the lower level, and it is estimated that there is enough to run the mill for the next two years. The ledge in the drift shows a width of from 8 to 12 ft.

GENESEE.—This mine continues to yield some fabulously rich rock, some of which, taken out during the past week, it is thought will yield thousands of dollars to the ton. The Superintendent proposes to add a number of stamps to the mill as soon as possible.

LARGE FORCE.—The Eureka Co., it is said, will keep all the hands now employed at the mine, through the winter. The mills will have to shut down before long, probably, but the men will be steadily employed taking out rock and making ready for next season.

NISSER GULCH.—Mr. Bell is cleaning out his ditch and making preparations to work his claims at his point.

SALE OF KU-KLUX CLAIMS.—Messrs. Goodwin and Garrey have recently purchased a one-fourth interest in the Ku-Klux claims, near Hungarian Hill, of Messrs. McCready & Roes for the sum of \$1,500.

RICH.—Mr. H. C. Bidwell was in town the other day, and showed us a prospect which amounted to 4½ ozs., the result of washing a pan of decomposed quartz in the Genevieve. Mr. B. informs us that he had one each of quartz, weighing 102 lbs., which would pay \$1,000.

GOON CLEAN UP.—The New York claim at Sawpit has paid much better than was anticipated for the past season. The recent rain furnished water for washing up the drift dirt which has been accumulating in the dump-house, and the yield is at the rate of about \$10 per day per man.

SAN DIEGO COUNTY.

THE COAL DISCOVERY.—San Diego Union, Dec. 26: Confirmation of the intelligence of the discovery of extensive coal fields in the vicinity of Temecula, in this county, is brought from San Bernardino by Judge Winder. Persons from Temecula had arrived at San Bernardino, bringing with them samples of the coal. They state that the deposits are very large, and that veins of coal can be found in all the hills in the vicinity of Temecula and San Jacinto. The Judge brought with him samples of the newly discovered coal. It is an excellent article of fuel, and if the deposits are half as large as represented, San Diego will supply the State with coal.

SIERRA COUNTY.

A BIG CLAIM.—Nevada Transcript, Jan. 4: J. M. Hickey, in company with Marke & Co., own a valuable mining claim at Brandy City, Sierra county. During the last season they have had abundance of water, and have taken out \$130,000, as the result of their work.

SONOMA COUNTY.

GEYSER PEAK QUICKSILVER.—Santa Rosa Democrat, Jan. 4: Mr. William G. Greene, in company with E. White, located the above named mine within about 6 miles of the Geysers. There are 3,000 ft. in the mine, and Mr. Green considers the discovery of great value. An specimen of the croppings was left here. If there is a deposit of the same character there can be no question of its value. A man was put to work, and Mr. Green will at once return and put on a sufficient force to test promptly the value of his discovery.

TUOLUMNE COUNTY.

DISCOVERY.—Tuolumne Independent, Jan. 4: Judge Lynch, an old mountaineer, has discovered a good quartz vein between the Spring Gulch mine and the Old Hunter mine, on the north boundary of Hunter cañon. He informs us that the vein is 2½ ft. deep, and the lead widens as they go down. It is thought that at a depth of 50 ft. the vein will be 10 ft. wide.

The Tuolumne Water Co. have now an abundance of water, and after a few necessary repairs to the works—expected to be completed yesterday—will run a full supply.

Nevada.

ELY DISTRICT.

BULLION.—Pioche Record, Dec. 28: The bullion shipments for the past week amount to \$73,289.00.

PORTLAND.—From the 100-ft. level a winze has been sunk 300 ft. in ore, the vein averaging from 2 to 3½ ft. wide. The ore for the last few ft. in the bottom has greatly improved and of superior quality. About 60 tons of first-class ore is now on the dump and as much more of second class is being cleaned. Average assays of \$250 per ton. Three shifts are at work. They are sinking a winze, and will cut the ledge in the working shaft at a distance of about 240 ft. Only such ore is being taken out as is met in the process of sinking and drifting.

RAILROAD.—This claim was located some months ago. The mine has got to the depth of 20 ft., with a ledge showing good ore for a rich strike before 50 ft. will be sunk. It is about 250 yds. distant from the Sunbeam, and alongside the Bullionville railroad track.

MALDONADO.—This mine was located in March, 1871, and is on the same mineral belt running from the Alps to the Sunbeam, and in a northerly direction about 300 ft. from the Silver Peak. The shaft has been sunk 95 ft., and about 24 ft. of ore below the ledge was struck and ore assaying \$50 per ton extracted.

ALPS.—During the week a rich ledge was cut in the drift from the main shaft. Drifted on the ledge 20 ft. The ore-vein is from 18 to 28 in. wide, with \$200-ore in sight. They are building a permanent ore-dump; they will forward and have milled immediately some 300 tons. The ore from this mine, worked last spring, yielded \$145.

CHIEF OF THE HILL.—A contract has been let to sink a shaft 200 ft. from the level of the tunnel, which has already reached a depth of 20 ft. The prospects are good at the present depth. The Magnet Mill commenced crushing ore for this company on Friday.

MONTANA.—The shaft is now 100 ft. deep, in quartzite and quartz, and all the indications point to the close proximity of a large body of ore. The work will be prosecuted night and day.

PIOCHE CHAMPION.—The main shaft in this mine, which was started about the 1st of October last, has now attained the depth of 230 ft.

GREY & BISHOP.—This mine is being worked vigorously. Three shifts of men are kept constantly at work. The indications are very favorable for a permanent ledge.

SPRING MOUNTAIN TUNNEL.—Superintendent Phillips feels confident that within the coming week he will make a rich strike.

SILVER PEAK.—Work is being carried on briskly.

WASHINGTON CO. CLAIM.—The mine is located in the Wasatch Mountains, within 4 miles of Kanarrva, Kane county, Utah. Veins have been opened in two or three places, and the work of development continues. A tunnel 677 feet is being run into the mountain, and the valuable deposits are being extracted. Owing to the heavy weather and the bad condition of the roads no coal is now being sent to market, but every preparation is being made for shipment to market early in the spring. A road from the mine to the valley is now being built, and will be completed in time for the opening of the spring trade. The coal beds are only about 90 miles from Pioche, and a road between this point and Kanarrva can be constructed at a trifling expense. Near to the coal beds are found vast deposits of iron, which, with coal at hand, will in a few years be utilized and added to the wealth of the world. The coal and iron so near to our doors, will cheapen the process by which silver is brought to the surface, and will permit the working of much rock now wasted on account of the expense.

HUMBOLDT.

GALENA.—Ulenville Silver State, Jan. 4: The Trinity mine, near Galena, is represented as being the richest in the State. Last week, at a depth of 25 ft. below the surface, a fine body of ore was struck.

HENNING MINE.—Twelve miners are now employed on the mine. The ledge is looking well, and is yielding considerable ore, which is being reduced at the Pioneer Mill. The company has expended several thousand dollars in building a road to the mine, and contemplates the erection of a furnace at an early day.

M. O. HANSEN.—J. O. Harris and J. C. Phillips, both experienced miners, have leased the Inskip mine, of the Pioneer & Inskip M. and C. Co., till the 1st of September next. The lessees will commence work on the mine immediately with a force of 4 or 6 men.

REESE RIVER.

BELOMONT.—Reese River Review, Dec. 31: Mr. Crockett reports from Belomont that he has spent several days at that place, during which time he examined several of the principal mines there. He speaks in the highest terms of the mineral resources of the district, and is of opinion that the mines in that district will in a short time prove the most productive in the State.

BULLION FROM BELOMONT.—Last week there arrived here, by F. & C. Co.'s freighter for San Francisco, seven bales of bullion, weighing 644 lbs., valued at about \$14,000. The bullion was shipped by the Monitor.

BULLION FOR DECEMBER.—W. F. & Co. shipped from their office in Austin, during the month of December, 25 bars of bullion, weighing 2,485 pounds and valued at \$35,299.09. It was all from the Manhattan mill, which was closed for repairs during the greater portion of the month.

BULLION SHIPMENT FOR 1872.—W. F. & Co. shipped from this city during the past year 754 bars of bullion, weighing 83,675 pounds, valued at \$1,074,618.92.

BELOMONT.—The rich strike of last week in this mine proves to be of a greater extent than it was at first supposed, and the ore is of a better quality. Work on the transport and the incline is increasing in size as the work progresses. The hrest of ore in this place is over five feet. All the slopes in the mine look splendidly.

MONITOR.—Cor. from Belmont, Jan. 4: The mill of this Co. has been running steadily on ore from the Monitor. Some 20 tons of ore per day are taken from the dump. The north level is now in 180 ft. from the lower tunnel. The winze being sunk from the level above is still going down rich ore. The slopes above the upper level look well.

EL DORADO SOUTH CO.—This company's mill is nearly completed. The machinery has been placed on top of the Steffelsfeldt furnace. The battery, pans, settlers, boilers and engines are set and ready to start up.

The work in the El Dorado progresses as usual. The size of the incline in the south is increasing in size as the work progresses. The hrest of ore in this place is over five feet. All the slopes in the mine look splendidly. A new boiler has been put on the mine for furnishing steam to the pump below.

This company's Arizona mine looks better than ever. The lower slopes show a breast of ore four feet wide, all of which from wall to wall will average between \$200 and \$300 per ton.

WASHOE.

BELOHER.—Gold Hill News, Jan. 4: Daily yield about 300 tons. The ore hrests on the floors above the 1000-ft. level show increased quantities of gold. Some of the ore taken out during the week is richly spangled with this precious metal. The 1000-ft. level is looking up and yielding splendidly, as usual. The 1200-ft. level is still continued south, the face of the drift being 247 ft. from the Crown Point line, and in fine ore. Sinking the main incline below the 1200-ft. station was resumed last night.

The 1200-ft. station is being opened in proper shape, and the drift north to it to connect with the south drift is already in 28 ft. of distance to go in order to connect this precious metal. The 1200-ft. level is looking up and yielding splendidly, as usual. The 1200-ft. level is still continued south, the face of the drift being 247 ft. from the Crown Point line, and in fine ore. Sinking the main incline below the 1200-ft. station was resumed last night.

The 1200-ft. station is being opened in proper shape, and the drift north to it to connect with the south drift is already in 28 ft. of distance to go in order to connect this precious metal. The 1200-ft. level is looking up and yielding splendidly, as usual. The 1200-ft. level is still continued south, the face of the drift being 247 ft. from the Crown Point line, and in fine ore. Sinking the main incline below the 1200-ft. station was resumed last night.

The 1200-ft. level is looking up and yielding splendidly, as usual. The 1200-ft. level is still continued south, the face of the drift being 247 ft. from the Crown Point line, and in fine ore. Sinking the main incline below the 1200-ft. station was resumed last night.

southerly direction. At the third station, or 800-ft. level, a main drift has been started, running in a south-westerly course.

STATE NORTHERN.—The water tanks, new pump-hobs, and other pumping machinery on the lower levels, are finished, and all in excellent working condition. The pumps are now hoisting water with the greatest ease from the 1,700 ft. level. The north winze, from the 1,500 to the 1,700-ft. levels, is down 132 ft. the sinking making fine progress.

CONS. VINDICTA.—The shaft is down 110 ft. below the 500-ft. level, in good working order, the sinking making excellent progress. The main north drift on the 1,167-ft. level from the Gould & Curry shaft is still pushed steadily ahead. The new machinery is working splendidly.

CALEBONIA.—The ore in the north drift on the 700-ft. level of the new shaft shows a most decided improvement. The new drift ascending from the main tunnel on the 700-ft. level is in 30 ft., making good progress, the drift south on the 300-ft. level of the old works is looking much more favorable.

SIEDRA NEVADA.—This mine continues to yield about the usual amount of good milling ore from the upper and middle portions of the old mine. The prospecting drift at the 600-ft. level of the new shaft are pushed steadily ahead.

REO JACKET.—This company will resume work by the first of February. The ledge is now six ft. in width.

SCORPION.—Situated at Six-mile Canon, close to Bidleman's ranch. Cleaning out the tunnel, which was run in 1864, 830 ft. in length, cutting two lodges, one of 600 ft. and one of 6 ft. The carrying gold only, and which paid at that time \$16 to \$18 per ton.

INDEPENDENCE AND OMEGA.—Located in 1859, and situated north of the Utah mine. Will resume work by sinking a shaft east of the tunnel, and put up all necessary machinery immediately. They cut a ledge six ft. in width in 1865, which assays well only 50 ft. from the surface.

SILVER HILL.—Work in the shaft progressing slowly. The main drift south on the first level is still in good ore. The north drift on the first level is pushed ahead.

INSURANCE.—Retimbering the air shaft is finished, and everything again in good working condition. The incline is down 92 ft., having partially cut through the ore body. Over half of the upper side of the shaft is still in good ore.

UNION CONS.—The north drift, from the main west drift on the line of the ledge has been stopped for the present, and another started near the east wall of the ledge which is now in about 30 ft. running through low grade ore.

LADY WASHINGTON.—This claim adjoins the New York Cons. on the south. The company will commence work by sinking a shaft and building the necessary hoisting works, and also putting up powerful machinery immediately, as the intention is to sink the shaft about 1,500 ft. in depth.

BUCKETE.—The Hope and Sherman mills are kept steadily running on ore from this mine. A fine body of ore was struck during the week in the prospecting drift 600 ft. south from the main incline.

MINT.—Work in the shaft has progressed slowly on account of the constant influx of water. The assays of ore for the week show a decided improvement.

BALTIMORE CONS.—The drift at the 250-ft. level is in 200 ft., the face is still in hard blasting rock. Owing to lack of wood, light progress has been made in the shaft.

KENTUCK.—Considerable good ore continues to be gleaned from the old workings of the mine about the 500 and 600-ft. levels.

IMPERIAL EMPIRE.—The surface work for the new machinery is making steady progress.

NEW YORK CONS.—Lack of wood still prevents work at the shaft.

ANOTHER RAISE.—Another raise commenced in the main tunnel. Work in the old raise is steadily progressing.

JULIA.—Sinking the shaft is making excellent headway. The main east drift on the 800-ft. level is in 265 ft., the face still in low grade ore.

PICTURE.—The principal work being done at present is the sinking of an incline from the main drift, in good line, south from the main incline.

CROWN POINT RAVINE.—This shaft is cleaned out and repaired and is now in good working condition to the depth of 120 ft.

KNICKERBOCKER.—The main west drift is in 468 ft. no material change in the character of the rock.

COODENTAL.—The main tunnel north is pushed steadily with no new developments.

UTAH.—Still running the north drift on the old adit level.

WOODVILLE.—Shaft down 330 ft., and still sinking in good pay ore.

Arizona.

MINEING MATTERS.—Prescott Miner, Dec. 21: The Marcus Co., of Weaver District, are still crushing ore with their arrastra, and the placer mines of said district are and have been taking out considerable gold, some of which is very coarse, as we learn from gentlemen who have recently seen several nuggets in possession of several citizens of Wickenburg. The gold of the Marcus mine contains \$19.50 to the ounce.

In Walnut Grove District, Allen Cullumber has two stamps and an arrastra at work, taking out gold. The War Eagle Co., in Bradshaw mountain, have commenced operations with renewed vigor, owing to the above which Capt. J. M. Irvin, who has recently bought in, is taking in the work of mining and milling. It is hoped here that the recent fall of snow will give rise to a heavy quantity of water, and that the mill and arrastra, in which case, they will, undoubtedly, secure a great deal of gold.

A party of prospectors started out this week for the Pinal Mountain country, where they expect to realize good wages from placer mines.

Another prospecting party will soon leave Prescott for the Santa Maria country.

Utah.

UTAH MINES.—Utah Mining Journal, Dec. 30: Three mines in Dry Canon, Ophir Dist., the Utah Queen, Congress and Miami, now in bonanzas, have been sold to Eastern capitalists.

A rich discovery has just been made at Bingham, in the foot hill of the west mountain dist.

The Utah Southern Railroad, pushing out from Salt Lake City to the great mining districts towards the south, the Pioche district being the objective point, and afterwards the Colorado river, has been advanced from a mere paper job to one of actual construction; several miles are already finished, and in a short time the track will be laid to Pioche. Not less than 300 freight teams are now employed in hauling freight over that route.

OPIMUM CULTURE.—Some time ago we printed a statistical article showing the wonderful profits accruing from the cultivation of the poppy and the production of opium. It is probably ten-fold more profitable than any other branch of agricultural industry. The climate and soil of the great San Joaquin valley are exactly similar, it is stated by those who know, to those of the valley of the Ganges, the greatest opium producing district in the world. There is no doubt that this valley is suited to the production of opium. We hope that the culture of the poppy will be tried and that the experiment of producing opium, so easily made but so important in its nature, will receive the attention and effort it deserves. If we can produce opium we have a mine of wealth richer than Golconda or the fabled Land of the Golden Fleece. Try the experiment.—Tulare Times.

The Falls of Oregon.

We present our readers this week with an illustration of the Falls of the Willamette river near Oregon city, and of the lower Multnomah Fall, 50 miles from Portland. The engravings are drawn from C. E. Watkins' celebrated photographic views of the great Northwest, the originals of which can be seen with other fine views of Pacific coast scenery at his world-renowned gallery, 22 Montgomery street, S. F.

So small a cut can give only a faint idea, of the magnificent scenery at the Falls of the Willamette. The cliffs on either side are over one hundred feet high, and are covered at the summit and in the less precipitous places with a growth of evergreens. Along the bank on the right hand side of the picture are the magnificent locks built the past season. They will pass a boat two hundred feet long and forty feet wide, and at the same time furnish a water power of 4,000-horse power capacity. They have been blasted out of the solid rock and built in the very best manner.

There will be over two thousand feet frontage for building factories upon and plenty of power to run them. Linn City was built upon this site but was swept away by the flood of December, '61.

The land calculated for building is mostly made from rocks taken from the lock and is above high water mark.

On the left hand bank for nearly half a mile below the falls, stretches the busy town of Oregon City. There is a level tract from forty to eighty rods wide between the river and the bluff, which is higher than the water above the falls, except in extreme high freshets. Just above the falls on this bank is the basin used by 7 or 8 of Holladay's boats for transferring cargoes from above the Falls. The arrangement has been so perfect that it is claimed that freight can be transferred from boat to boat for fifteen cents per ton. This basin gives a fine water power of which 500 to 600 horse power are used. This drives two grist mills, a woolen mill, a tub factory, a furniture factory, etc. A good part of the residences are on the level plateau above the bluff, and strangers passing through the place are not apt to form a correct idea of its size. The manufacturing facilities of this place are such that it is hoped that it will do more for Portland than Lowell has done for Boston. They are at present suffering great loss from the burning of the woolen mills which were the most extensive in the State. The prospect is that they will soon be rebuilt and running as successfully as ever. Messrs. Goldsmith and Teal the proprietors of the locks have purchased some boats to run on the Willamette, and it is expected that they will have a connecting line of steamers to run to San Francisco.

There will soon be a vigorous opposition for freights from Oregon to San Francisco.

How SOIL was MADE.—Prof. Agassiz says that all the materials on which agricultural progress depends are decomposed rocks, not so much those that underlie the soil, but those on the surface, and brought from a considerable distance, and ground to powder by the rasping of the glaciers. Ice all over the continent is the agent that has ground out more soil than all other agencies put together. The penetration of water into the rocks, frosts, running water and baking suns have done something, but the glaciers more. In a former age the whole United States was covered with ice several thousand feet thick; and this ice moving from North to South by the attraction of the tropical warmth or pressing weight of the snow and ice behind, ground the rocks over which it passed into the paste which we call soil. These masses of ice can be tracked as game is tracked by the hunter. He has made a study of them in this country as far South as Alabama, but has observed the same phenomenon in Europe, particularly in Italy, where, among the Alps, glaciers are now in progress. The stones and rocks ground and polished by the glaciers can easily be distinguished from those scratched by running water. The angular boulders found in meadows and the terraces of rivers not reached by water can be accounted for only in this way.

The claim of Delaney & Clever on the bar of the Klamath, some distance below the mouth of McKinley Creek, has continued to pay well, yielding from \$30 to \$40 per day, to the hand.

Silver Mining.

Few men are less affected by changes of weather, says the *Pioche Record*, than those who delve beneath the earth's surface for the shining silver, which brings competency to and provides labor for thousands, besides enriching the country and rearing houses upon the bleak hills of this sagebrush land—even building large towns and thrifty villages where a lizard could scarcely find sustenance. Other trades are often brought to a stand-still by the freaks of the weather. A cold snap sometimes interferes with the work of the plasterer by freezing his mortar; a wet spell drives the carpenter and the bricklayer from his labor. But he who penetrates the howels of the earth is unaffected by the changes in the weather. Be it during the severest winter, when the cold is pinching and the winds are howling, or in the heat of summer, when all things melt beneath the oppressive rays of the sun, or during the driving snow storm or beating rain, with a Washoe zephyr by way of an accompaniment, it is all the same to the miner. The temperature is the same throughout the year; bleak, cold December and balmy May are the same to him. Far from the surface, he is subjected to no inconvenience such as disturb those who move upon the earth's surface. It seems in the eternal fitness of things that the miner should be exempt from some of the evils to which other mortals are subjected. He suffers many privations unknown to others, and runs many risks of death or serious injury to which men in

THE WILLAMETTE FALLS, NEAR OREGON CITY.

being compelled, through the exigencies of life, to pass the greater part of their time in pits and manufactories where ventilation is defective, or in which the air respired is poisoned by noxious fumes and offensive emanations from the materials undergoing the process of manufacture! How many are falling victims to the poisonous influence upon the heart of the atmosphere of an underground railway! What do these facts suggest? How are these evil results to be prevented? The simple answer is: Let the rooms in which you live be effectually ventilated by an incoming current of air filtered from all adventitious impurities, and so divided that no draught shall be felt; and by an outgoing current which shall remove from the apartments the carbonic acid, carbonic oxide, sulphurous acid gas, sulphuretted hydrogen, and other noxious compounds, as rapidly as they are generated.—*Popular Science Monthly*.

Pacific Trade Ports.

Chili.

Of all the republics of Spanish America, Chili is probably the most progressive, not excepting Peru. It may, indeed, be termed the California of South America, to which it bears many remarkable points of resemblance, both in climate, soil, scenery, agriculture and the character of its inhabitants. In one point it is far ahead of the Northern Pacific Coast of the United States, in that, with an area about the same as California, it has nearly four times as many inhabitants, its population being over two millions and a quarter. It is famous for its wheat, which formerly supplied the wants of California and Australia and is now exported to England at much more advantage than that of California, the cost of transport being only about one-half that from San Francisco. It also produces immense quantities of hides, and its

LOWER MULTNOMAH FALLS, COLUMBIA RIVER.

other business are strangers. His task is a hard one, yet he follows it day and night, bringing to the earth's surface the precious metals which throw their colossal wealth into the lap of commerce, spreading blessings and contentment through the land.

Interoceanic Canal.

From the report of the Secretary of the Navy are taken the following facts relative to the survey of a ship canal across the Isthmus between North and South America:

Commander Selfridge, who conducted the previous surveys of the Isthmus of Darien, is now engaged in completing the final exploration of that Isthmus between Panama and the shoulder of South America. Recent information favors the exploration of the valley of the river Bojaya, lying some ten miles south of and, in general, parallel to that of the river Napipi, already examined. This completed, the entire Isthmus lying south and east of the line of the Panama Railroad will have been sufficiently examined to establish the relative difficulties of constructing a ship canal, as well as the line lying further south, between the river Atrato and the Pacific Ocean.

The expedition to Nicaragua, destined for a similar purpose, is engaged upon the work assigned to it. An unlimited water supply, at a summit of 106 feet above the mean height of the ocean presents too favorable a feature to forego, a close examination of the whole region. Difficulties, stated in the report of the chief of the Bureau of Navigation, delayed the progress of this survey; nevertheless, a location for Lake Nicaragua to Brito, on the Pacific coast, is found to be more favorable than any hitherto known.

Necessity of Ventilation.

I hold that the breathing of impure air is a fruitful source of disease of the heart occurring after middle age. How many people ignorantly favor its occurrence by confining themselves to closely shut, non-ventilated, hot, stifling rooms, in which the carbonic acid has accumulated to two or three per cent. of the air they respire! How many are thus destroyed by

as it is the centre of a large district now open to settlement, in consequence of the cessation of the incursions of the Amacainam Indians.

Imports and Exports

Of Chili are large for the population, in fact, as large as those of the United States. We have already indicated the nature of the exports. They include as well, wool, wine and crude chemical materials largely. Their amount is about \$30,000,000, annually, and that of the imports about \$20,000,000. About three per cent. of the exports go to the United States, and about seven per cent of the imports are obtained thence. The balance of the trade is nearly all done with England and France.

Shall We Lose Our Tea Trade.

A serious danger now threatens the tea trade of this city. The Isthmus of Suez shortening by more than one-half the length of the passage from India to Western Europe and America, and allowing of the passage of ships of burthen, has been made use of to send cargoes of tea from China to New York by swiftly sailing steamers. The result is that the merchants of New York have been enabled to have cargoes landed at the doors of their warehouses without breakage and in prime condition at a less cost than they could obtain the same teas by way of San Francisco. It is said, also, that in consequence of the cargoes being unbroken during the voyage, that there is far less risk of accident, and that the teas arrived in far superior condition. It is evident that we have been relying supinely on the hope that our natural position placing us in the commercial

centre of the shortest route from Chinato New York, would suffice to secure to us the tea trade of a continent for all time coming. The awaking from this delusion is sufficiently unpleasant; let us hope that it will stir our merchants up to the necessity of adopting some means of securing cheaper transit. If not, they will be left only the local tea trade of the coast, and it is doubtful if they will be able to keep that entirely, for those who handle large quantities of goods can always handle them cheaply, and there is little doubt that the business men of New York would be content to lose a little on the Pacific Coast consignments of tea for a couple of years, to drive the San Francisco dealers from the market. And though by far the greater part of the tea im-

ported by way of this city for the last two or three years has merely passed through, our merchants were beginning to take their share of it, and in a dozen years would have monopolized it. Such houses as those of Castle Bros.; Adolphe Low & Co.; Macondray, etc., etc., were gradually feeling their way further East every day with the commodities imported from the Pacific Coasts and Islands, and were building up for the city a grand trade in the future.

Its Principal Ports

Are, first, that of Copisipo, which is as yet but small, but is the centre of the important copper trade of Chili.

We next meet with Coquimbo, which is connected by rail with Las Garcas. It is well built and has a large trade in exporting copper, equalling three quarters of a million dollars yearly. Its population is about 10,000.

Valparaiso, the principal seaport, is next met with. It is the largest and most important commercial city on the west coast of America, excepting only San Francisco. Its harbor is fine and spacious, semi-circular in form, but is exposed from the north. The growth of Valparaiso has been very rapid, and its population cannot now be much less than 100,000. It is connected with Santiago, the capital, by a railroad about one hundred miles long, and will doubtless within the next decade be united to Buenos Ayres on the Atlantic by a transcontinental railroad, girdling that part of the continent. This railroad has been long in inception, and in fact the road from Buenos Ayres westward may be considered but its commencement. Valparaiso exports largely wheat, hides and other agricultural and mining productions. The completion of the transcontinental line of telegraph puts it in connection with Buenos Ayres on the East, and with the completion of the projected line between Liebon, Rio de Janeiro and Buenos Ayres, its newspapers will be enabled to give their readers all the news of the world as quickly and as rapidly as do those of San Francisco its citizens now.

We next meet Concepcion, with a population of about 14,000, situated on a large square inlet looking to the north and the mouth of which is divided into two channels by an island. Concepcion has a good chance of being the western termination of the proposed transcontinental railroad, one of the lowest passes of the Andes lying east of it.

Valdivia, situated in the latitude of San Francisco, is like it also in having one of the finest ports in the South Pacific. It is as yet but small, but is rapidly growing in importance, inasmuch

as it is the centre of a large district now open to settlement, in consequence of the cessation of the incursions of the Amacainam Indians.

The *Chronicle* of this city has been proposing the building of a freight railroad, to cost \$100,000,000, and to pass south of the line of the Colorado. This is just what we want for the future, but how about the present. During the five years in which such a railroad would be building, we would, with things as they are now, have totally lost the trade, nay, Eastern merchants would have encroached on our own peculiar domain, and it would require ten years to recover the ground we had lost during the preceding five. We want to take action at once. And that action must be such as shall persuade the Central Pacific Railway Company, the China Mail Steamship Line, and the Union Pacific R. R. Co., that it is to their interest equally with ours to establish such a scale of freight charges for teas as shall render competition, via Suez, impossible. The majority of our business men not being in the tea line, may think that it is none of their business, but they should consider that the losing of the tea trade of the future will necessitate the loss of many other branches of trade which we are now endeavoring to grasp, but which will elude us as surely as the tea trade. We want immediate action on this matter.

BRITISH COLUMBIA MINES.—The *Standard* of the 28th says: The Seymour Narrows and Bute Inlet Railway parties have discovered iron and coal beds, rich in quality and of large extent. Application has been made to the Lands and Works for mining leases of the same. The discoveries will prove most valuable in connection with the building of the line of the Central Pacific.

Useful Information.

The Cause of Paint Cracking

One says because there is too much oil in it; another not oil enough; another thinks because it has dried too quick and soon. The fact is, says the *Coachmakers' Journal*, that more paint cracks from the use of oil, and hasty work than anything else. Some, in fact a good many painters persist in mixing their paint very elastic although, thinking that they will have a tough elastic coat like rubber, that will give to the swelling and shrinking of the wood, without cracking, and scarcely break apart, if the panel of a buggy were split in two. Well we will admit that in that way they can get a very elastic coat, and if it would remain that way and never dry, it would be the thing, but the paint will dry sometimes. Any material will contract in drying. Their elastic body of paint will continue to dry and contract until its elasticity gets to its utmost limits, then it will give way and spread apart in great gaping cracks.

To paint up a job with elastic coats of paint, it should go through a very long process, and the different coats be put on thin and not put on one coat of paint until the previous coat is perfectly dry. Putting on a number of heavy coats of paint or rough stuff as fast as they are fairly set will cause cracking of the worst kind either before or after varnishing. Paint is too often supposed to be dry, when it is really not half dry. Six months of good drying weather would be a short time to get a coach body ready for the varnish on the elastic or tacky principle, and that is not all there is to contend with; in the oil process, the oil will sweat through the varnish and cause it to lose its brilliancy or luster.

The quick process, or flat coating, can be hurried so that it will crack, and crack badly. Our few limited ideas about obviating cracking are all summed up in a few words, viz: let every part of the wood be thoroughly primed with a good fresh priming; prime inside and out, so the weather cannot act on the wood; let the priming get perfectly dry; then mix every coat of lead and rough stuff with japsans and varnishes that will dry firm and hard; put enough in to bind the paint well and no more; have every coat dead color; do not put on the coats too heavy; let every coat be bone dry before putting on another; put on enough of coats to fill the grain of the wood, and make a perfect surface, and no more, then you will have a body of paint that is firmly bound together, and thoroughly dry, and when paint is thoroughly dry it can shrink no more (it only shrinks when drying) and if it don't shrink it cannot crack, and in this kind of a body of paint there is no moisture or oil to sweat out and destroy the luster of the varnish. Painting of this description will not crack until the joints of the wood begin to give away and let the water and damp atmosphere in and swell the wood along the edges of the joints and cause the paint to crack from the swelling and shrinking of the wood. Varnish may crack on the top of the best painting.

If the paint is not well protected by varnish it will perish in time, sooner or later, owing to how well it is protected. The ravages of time will destroy anything that is temporal. Now-a-days, painters will paint jobs in two weeks, and wonder why it cracks; the blame is generally laid on the material or anything else but the right cause.

CURIOUS CASE OF SPONTANEOUS COMBUSTION.—We have from France a well-attested case of spontaneous combustion, the particulars of which are thus given in the "Comptes Rendus" of the Academy of Sciences. On one of the hottest days of last summer, M. Wattier-Guérin, a manufacturer of Rihemont, happened to observe a light smoke rising from an oaken beam which had for a considerable time stood in the courtyard of his premises, one end leaning against a wall. This beam was some twenty feet in length and six by nine inches square, and stood perfectly isolated, with the exception that an old well-cover made of boards, sheath-iron, and slates, leaned against it. On coming nearer, M. Wattier saw that the beam was on fire, but gave out no flame, the surface presenting the appearance of an extinguished coal fire. By blowing upon it, it was found to be burning vigorously. This fire did not commence at the lower extremity of the beam, but at the point where it came in contact with the well-cover. Thence it spread upwards, advancing in the form of a V, and finally involved the entire thickness of the beam, extending over ten feet in length.

ARTIFICIAL VOLCANOES.—A Viennese chemist, Hochstetter, has been experimenting upon the artificial production of volcanic eruptions in miniature. His process is based upon a certain property possessed by sulphur, in virtue of which that substance, when melted under the vapor of water having a pressure of three atmospheres, absorbs a certain amount of the water, and then the latter, as the sulphur cools, escapes in shape of steam. Thus, if you take a hundred weight of sulphur, and subject it to the above treatment, when cooling begins a superficial crust is formed; if then you make an opening in this crust, there will be a succession of explosions and emissions of steam and sulphur. In the course of an hour a cone will be formed, having a diameter of ten or twelve inches at its base, and two or three inches in height, closely resembling the cone of a volcano, formed by the successive currents of lava.

MIRROR PHOTOGRAPHS. as they are called, are silvered glass with a picture pasted on the back. There is no silver where the picture is seen, but on the sides there is enough metal to give the effect of a mirror. A person could have his photograph taken and so placed upon silvered glass as to enable himself to see what the camera had made of him and what reflected light disclosed. If platinum were to be employed in place of silver, the thin film would show no picture by transmitted light, but by reflected light the image would appear. Such a device as this would be capable of extensive application in show windows and interior counting rooms. Glass partitions could be so arranged that persons sitting behind them could see all that was going on in a store while they would themselves be invisible. It is thought that if a thin gelatin print were to be pasted upon the glass, an engraved picture could be produced by means of the sand blast, which could be subsequently silvered or not, according to the purposes to which it is to be applied. Elegant results could be obtained in this way for many ornamental purposes.

THE GREAT WALL IN CHINA.—Mr. Seward, in speaking of the great wall in China, which he examined during his late trip at the East, says: "The Chinese have been for the past two or three thousand years a wall-making people. It would bankrupt New York or Paris to build the walls of the city of Pekin. The great wall of China is the wall of the world. It is forty feet high. The lower thirty feet is of hewn limestone or granite. Two modern carriages may pass each other on the summit. It has a parapet throughout its whole length, with convenient staircases, buttresses, and garrison-houses at every quarter of a mile, and it runs, not by cutting down hills and building up valleys, but over the uneven crests of the mountains, and down through their gorges a distance of a thousand miles. Admiral Rodgers and I calculated that it would cost more now to build the great wall of China through its extent of one thousand miles than it has cost to build fifty-five thousand miles of railroad in the United States. What a commentary it is upon the ephemeral range of the human intellect to see this great utilitarian enterprise, so necessary and effective two thousand years ago, now not merely useless, but an incubrance and an obstruction."

TO MAKE COURT PLASTER.—To make court plaster, soak isinglass in a little warm water for twenty-four hours; then evaporate nearly all the water by a gentle heat, dissolve the residue in a little proof spirits of wine, and strain the whole through a piece of open linen. The strained mass should be a stiff jelly when cool. Now, extend a piece of silk on a wooden frame, and fit it tight with tacks and thread. Melt this jelly and apply it to the silk thinly and evenly with a hair brush. A second coating must be applied when the first has dried. When both are dry, cover the whole surface with two or three coatings of Balsam of Peru, applied in the same way. Plaster thus made is very pliable, and never breaks.—*Rural New Yorker.*

ORNAMENTING LAMPS.—I wonder if many readers are aware what a pretty effect may be produced by pasting with mucilage autumn leaves and ferns on the inside of porcelain shades. I refer particularly to the student lamp. Of course they should be the brightest, smallest specimens, and may be arranged either in clusters or a wreath all the way around. They should be prepared in the usual way, pressed or ironed. I brush mine with linseed oil, but I am not sure that is essential. They will remain bright two or three months, and when faded can be easily soaked off with warm water and replaced with others.—*Rural New Yorker.*

WETTING COAL FOR HEATING BOILERS.—M. Seidler refutes the opinion, so generally prevailing that wet coals burn better or produce more heat than dry ones. If the blacksmiths sprinkle their coal dust near the blast pipe with water, they merely do it to keep the top layer in shape. Wet coal burns as slowly as green wood, evidently from the fact that the water must evaporate before the fuel will burst out in flames. The author always obtained more steam by employing dry coal, and in a comparative trial, extending over a week, he saved fourteen tons of coal by not wetting it.

A BEAUTIFUL EXPERIMENT.—When fifteen to twenty grammes of granulated silver is introduced into a perfectly dry tube of hard white glass, with from thirty to forty grammes of bisulphide of carbon, and then hermetically sealed, on warming gently and then shaking in the dark, sparks are observed in the liquid, which by continued shaking may be rendered quite luminous. Pouring water on the tube causes the luminosity to disappear, but on shaking it becomes visible. This is a beautiful experiment. Iron and aluminum produce similar effects, while platinum, copper and zinc do not.

ARTIFICIAL SKINS FOR SAUSAGES.—In Wurtemberg there has been started a new industry, which consists in the manufacture of skins of parchment paper for sausages. This artificial product is considerably cheaper than the natural one; it is not subject to fermentation, and is distinguished for its cleanliness. It is made by means of machines, in the thickness of ordinary writing paper, and sent to any address through the Post Office.

Good Health.

CUNDURANGO AND SARSAPARILLA.—The famous cundurango, from which so much was expected in the cure of cancer, is said to have derived its name from the circumstance that the condor, (cundur) when bitten by poisonous snakes, eats its leaves as an antidote to their poison; hence *cundurango*, signifying condor vine. Its use in Europe as a remedy for cancer appears to have been attended with very doubtful success.

The *Philadelphical Medical Times* in speaking of this plant remarks that "It was not the curing of cancer, but it was the obtaining of a profit of somebats about 1900 per cent. (\$38 per pound on an article costing not \$2 per pound), that animated the advocates of cundurango. The bubble has, however, been pricked; and we presume that Messrs. Bliss & Keene, more in sorrow than in anger, watch the fading glories of their great specific. They are making a feeble stand, or some one is trying to do so for them, on its anti-syphilitic powers; this will perhaps work off this stock they have on hand, but it will hardly do more.

One point of curious dissimilarity may be noticed between the medical history of this article and that of its analogue, sarsaparilla; namely, the comparatively short time required for the explosion of the claims of the former. The explanation is undoubtedly to be found in the free and constant reports of the results of experiments all over the world, which modern means of communication alone could render possible. Sarsaparilla held its own in country neighborhoods, retired towns, and remote places, long after it had been tried and found wanting at the great centres of medical science. Cundurango is known as a stupendous failure wherever it is known at all."

PHENOMENA OF THE BRAIN.—One of the most inconceivable things in the nature of the brain is that, although the organ of sensation, it should itself be insensible. To cut the brain gives no pain; yet in the brain resides the power of feeling pain in any part of the body. If the nerve which leads to it from the injured part be divided, we become instantly unconscious of suffering. It is only by communication with the brain that any kind of sensation is produced; yet the organ is itself insensible. But there is a circumstance more wonderful still. A certain portion of the brain itself may be removed without destroying life. The animal lives and performs all those functions which are necessary to simple vitality, but it has no longer a mind. It cannot think or feel. It requires that the food should be pushed into its stomach; once there it is digested, and the animal will even thrive and grow fat. We infer, therefore, that a part of the brain is simply intended for the exercise of the intellectual faculties, whether of the lower degree, called instinct, or of that exalted kind bestowed on man, called reason.

NOW AND THEN.—The *Pulse of Health* says, in relation to, and deprecation of, what it calls "Sensational Hygiene": Certain facts are so patent—as for instance, that the present cookery is far better than that of twenty years ago; our clothing warmer in winter, cooler in summer, and every way more sensible than that of the last generation; our modern houses incomparably more convenient and comfortable than those they replace; our habits of life, in every essential respect, more healthy, cleanly, and refined than those of any other nation or age; and, finally, as the direct outcome of these improved conditions, the average of life is so steadily increasing—these facts are so obvious and pertinent that the necessity for exaggeration, dogmatism, and sensational half-truths concerning hygiene, if such necessity ever did exist, certainly exists no longer.

PHOSPHATED CANDY is the latest novelty in the medicated line. It is based on this popular, though not yet well established idea, that there is a brain waste of phosphorus which ought to be made good by some special or medicated food. Phosphoric acid, associated with iron, is sometimes prescribed by physicians; and the idea of disguising the unpleasant nature of phosphoric acid by administering it in candy is certainly ingenious and may be advantageous. We are a nation of candy eaters and as bonbons are popular everywhere, perhaps we may as well employ them as an agreeable vehicle for taking disagreeable medicine, as indeed is already done to a considerable extent.

ACTIVITY AND HEALTH.—Men who have half a dozen irons in the fire are not the ones to go crazy. It is the man of voluntary or compelled leisure, who mopes and pines and thinks himself into the mad-house or grave. Motion is all nature's law. Action is man's salvation, physical and mental; and yet nine out of ten are wistfully looking forward to the coveted hour when they shall have leisure to do nothing—the very siren that has lured to death many a "successful" man. He only is truly wise who lays himself out to work till life's latest hour, and that is the man who will live the longest, and will live to most purpose.

HOW TO WALK.—A smooth, long step, the weight of the body on the loins, where nature intended it should be, and the legs propelled from thence, without either stiffness at the knee or obtrusive motion of the hips, is, probably, the ideal of walking, and such one finds both in a highly trained woman and the untutored perfection of a South Sea Islander.

A STRANGE DISEASE.—Intense radiation of heat in the great desert of Sahara produces extraordinary effects on insects as well as animals and men. When a caravan starts out to traverse that wide waste of desolation, flies follow on in prodigious multitudes, attracted, no doubt, by odor from the camels, but they soon drop dead by the intensified heat. Fleas, burrowing in hair, straw, or sacks, are killed off rapidly. But the most singular of all is the malady to which men are incident after being exposed a short time to burning sands and a vertical sun on that arid and life-forsaken region. It is called *ragle*—a kind of brain fever. The stricken traveller is delighted, amused, and made extensively happy by exhibitions of fantastic forms. He sees mirages, palm-trees, groups of tents, shady mountains, sparkling cascades, and misty forms dancing delightfully before his entranced vision. From all that can be gathered upon the subject, it appears that a certain condition of atmosphere, wholly free from moisture, with intense solar heat, produces effects on the brain similar to hashish. Both exalt the nervous system, and speedily destroy all desire to exist, deprived of that unnatural excitation of the brain.

TAKING COLD.—If a cold settles on the outer covering of the lungs, it becomes pneumonia, inflammation of the lungs, or lungfever and in many cases carries off the strongest man to the grave within a week. If cold falls upon the inner covering of the lungs, it is pleurisy, with its knife-like pains and its slow, very slow recoveries. If a cold settles in the joints, there is rheumatism with its agonies of pain, and rheumatism of the heart, which in an instant sometimes snaps asunder the cords of life with no friendly warning. It is of the utmost practical importance, then, in the winter weather, to know not so much how to cure a cold as how to avoid it.

Colds always come from one cause, some part of this body being colder than natural for a time. If a person will keep his or her feet warm always, and never allow himself or herself to be chilled, he or she will never take cold in a lifetime; and this can only be accomplished by due care in warm clothing and avoidance of drafts and exposure. While multitudes of colds come from cold feet, perhaps, the majority arise from cooling off too quickly after becoming a little warmer than is natural from exercise or work, or from confinement to a warm apartment.—*Sci. Am.*

INDIA-RUBBER CLOTH IN SKIN DISEASES.—From a note translated by *The Doctor*, we learn that since 1868, M. Hardy, of Paris, has been employing india-rubber cloth in place of poultices or local baths. He employs pieces of cotton, covered with a layer of caoutchouc, and forming an impermeable tissue. This is only applicable to the extremities and to the head; and for the latter region he makes use of vulcanized india-rubber caps. After a certain time, the part enveloped becomes not disagreeably warm, and then an abundant sweating takes place, under the influence of which the crusts, and the squames which cover the skin are removed, the epidermis spreads over the ulcers, and the skin becomes softened.

The results obtained are similar to those obtained by poultices, but preferable for many reasons. Daily experience of the Hospital St. Louis shows a great rapidity in the modification of the skin; two or three days of application suffices completely to cleanse the scalp when covered with abundant scales of eczema, etc. After forty-eight hours' application of the india-rubber cloth upon hauds attacked with chronic eczema, with fissures and cracks in all directions, the wound becomes cicatrized, and the skin recovers its suppleness.

NEW CURE FOR RHEUMATISM.—There are a thousand pretended cures for rheumatic and neuralgic affections, not one of which is found to effectually eradicate them. If a remedy could be devised to answer that end, its discoverer would be entitled to the thanks of the world, and might amass for himself a colossal fortune. A therapist of London thinks he has hit upon it, in the administration of hot sand baths. He claims that its advantage consists in the fact that it does not suppress perspiration like the hot water bath, but rather increases it, and does not interfere with the respiration like the steam bath or Turkish bath. The body can endure its influence for a much longer time, and a much higher temperature can be applied. It can be used for infants, and permits of easy application to a part or to the whole body. Sufferers who are willing to resort to almost any expedient to relieve the intense pain of these diseases, will ascertain the efficacy of the recommended cure by giving it a trial.

IS CARBOLIC ACID POISON WHEN PURE.—Hamberger has ventured to assert that pure carbolie acid is not a poison, and that the poisonous properties of ordinary commercial acid is due to impurities in it. To this view Hnemann takes exception, and publishes the results of a series of experiments made with rabbits, in which all specimens of carbolie acid acted as poison, whether taken into the stomach or injected into the circulation.

LAXATIVE MIXTURE.—Prof. Lindley says the best remedy he has ever tried in habitual constipation, is to take a half drachm of Epsom salts, dissolved in half a pint of water—adding ten drops of Elixir of Vitriol—one hour before breakfast. The smaller the dose the better, provided it will operate. It may be taken for weeks till a cure is effected.

MINING SUMMARY from various counties in California, Nevada, Arizona and Utah, 20-1. Market Reports, 28.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 20.

MISCELLANEOUS.—The Seattle Coal Mines; The Champion Numismatist, 18. Silver Mining Interests; Canal; Necessity of Ventilation; Pacific Trade Ports, 22. Resources of Utah, 26. Patents and Inventions, 28.

UTAH SILVER MINING CO., BINGHAM CANON, UTAH.—Professor Clayton who has just inspected this property, concludes an exhaustive report as follows: "I have no doubt about the extent, value and permanency of your mines. The report made to you by Mr. Henry Sewell, as to the extent and value of your mines, I believe to be correct in every essential particular; and if the mines have been worked at a loss the fault is more with the management than with the mines. It is true the ores are of low grade, but they are also abundant and easily mined. The fault is not with the mines; an ample working capital and proper skill to use it all that is required to place your property on the list of dividend-paying mines."

TOPOGRAPHICAL PLASTER MODEL.—Mr. C. W. Hendel, County Surveyor of Sierra county, has shown us at the Swiss hotel, Commercial street, a very finely executed model, in plaster, of the topography of State Creek and adjoining country, bordering upon the county lines of Sierra and Plumas. This model is the same that was exhibited at the late State Fair, and is a very fine and quite artistic piece of work. Such models are very valuable for reference and study. Every important mining section in the State should be thus represented.

MINERALS AND MINING IN JAPAN.—We have received a communication from Mr. Kaderly in relation to our recent notice of his collection of minerals from Japan, and also furnishing some further important facts with regard to mines and mining in Japan. The communication will appear next week.

CLEAN UP.—The Eureka, at Grass Valley, after a run of five days, with ten attempts, cleaned up, January 4th, from the amalgamators alone, without touching the battery, the sum of \$11,830 in gold coin.

ON FILE.—Query, from M. C., Little Lake Mendocino Co.; Letter from J. W., San Mateo.

The Mining Interest in 1872.

The year which has just closed has been a very prosperous one to the mining community, although it is more remarkable for steady, general and uniform progress than any marked and particular success. The quartz interests of the hulkion-producing States and Territories are in a flourishing condition and p'acer mining, particularly in California, is making rapid strides. We hear from all parts of California of large ditch enterprises, reservoirs for preserving surplus water, etc., which are to assist that particular branch of industry, and there is a growing confidence among capitalists to invest in gravel claims, which will encourage others to do likewise. The manner in which this work is carried on at present requires a considerable outlay of time and money to inaugurate it but when once in running condition the income is correspondingly great. The mining towns of the coast are improving in character and our miners are no longer considered a nomadic race, but seem content to settle down to business like people of other trades. This encourages industrious habits and gives permanent value to property in the mining towns which hitherto they up and fosters other industries. We have had no "excitements" or stampedes for some time and people really begin to look upon mining more as a legitimate business than as a venture.

Railroads are exercising their potent influence throughout the coast, and now, many mines which were previously thought unprofitable, are worked with success through having facilities for transportation. Many narrow-gauge roads are in process of construction or contemplated, Utah leading us in this respect. We have had few disturbances to chronicle among miners this year and few "strikes" or coercive measures. Accidents have been numerous but not out of proportion to the increase of quartz mining; but with improved appliances and more care we hope to have less the coming year.

Fluctuations of mining stocks in this city during the year have been great. In the earlier part everything was high and the community in a fever of excitement. The last eight months, however, stocks have been generally depressed, with a few exceptions, but business is expected to be better in the spring. The merits of the "diamond awindle" have been discussed at length in these columns, so it is unnecessary for us now to go into particulars concerning it. Large numbers of new quartz claims have been opened during the year and in Utah particularly, the increase in this respect has been wonderful. The foreign capital invested in the mines of this coast is a gratifying evidence of the estimation in which they are held abroad, and exercise also a beneficial influence on the localities where the investments are made. More care is now taken in buying mining properties and we are glad to see, in managing them also. A radical change is being effected in this last particular, stockholders having come to the conclusion that they have rights which trustees are bound to respect. There is still room, however, for improvement.

Bullion Product of 1872.

The profits of the year are naturally of much interest to us all, as showing material advancement and success. It is rather early as yet to give full returns from all localities and it may be mentioned that the yield of California has been lessened from want of water to work the placers, which will not occur this year; measures are now being taken to store up surplus water for use at the proper time.

J. J. Valentine, General Superintendent of the Bullion Department of Wells, Fargo & Co.'s Express, has prepared a statement of the production of precious metals west of the Missouri River for the year 1872. The total exceeds \$62,000,000, most of which passed through the Express Company as carriers, and may therefore be relied upon as essentially correct. We condense as follows:

Gold by Express.....	\$27,352,968
Gold by other conveyances.....	3,076,801
Silver by Express.....	24,196,719
Ores and base Bullion.....	7,610,436
Total.....	\$62,236,914

The sources of the above treasure are given in the annexed table:

California.....	\$19,049,098
Nevada.....	25,648,811
Oregon.....	1,905,035
Washington.....	226,051
Idaho.....	2,514,900
Montana.....	4,442,135
Utah.....	3,521,020
Arizona.....	143,777
Colorado.....	3,001,751
Mexico.....	535,072
British Columbia.....	1,350,074
Total.....	\$62,236,914

The product for the year shows an increase over 1871 of \$3,952,884, chiefly due to gains from Nevada and Utah.

Mr. Valentine says that he has used great care in ascertaining the amount of ore and base bullion, carried by freight and the percentage allowed for gold dust carried by U. S. mail, travelers, etc., is considered liberal. Express communication in Arizona being so limited, the figures concerning the product of that Territory may be incorrect.

The Nevada Yield.

Complete returns of the State have not as yet been received at the State Controller's office but the *Territorial Enterprise* places the gold and silver product of Nevada at between \$22,000,000 and \$23,000,000, which is two or three millions less than the figures given by Wells, Fargo & Co.

The following statement from the assessment rolls of the different counties of the State for the first nine months of the year will be interesting. We omit fractions of tone:

COUNTIES.	TONS EXTRACTED.	GROSS YIELD.	NET YIELD.
Elko.....	6,073	\$ 343,487.87	\$ 137,113.64
Esmeralda.....	3,406	74,165.56	19,809.49
Humboldt.....	6,233	254,618.07	81,653.56
Lander.....	40,895	1,871,378.43	687,889.31
Lincoln.....	37,776	4,001,788.39	2,270,897.36
Nye.....	2,152	327,734.06	144,485.36
Storey.....	293,717	9,337,378.05	4,105,190.02
White Pine.....	18,415	155,303.41	22,523.68
Total.....	407,670	\$16,825,851.86	\$7,673,563.42

COUNTIES.	TONS EXTRACTED.	GROSS YIELD.	NET YIELD.
Elko.....	2,444	\$ 17,208.90	\$ 1,763.07
Humboldt.....	9,150	96,921.86	9,692.18
Lyon.....	187,364	628,116.54	74,718.66
Lincoln.....	904	17,770.91	4,689.20
Storey.....	124,691	225,532.17	38,829.30
Washoe.....	6,521	36,610.00	9,591.00
White Pine.....	4,270	14,396.39	1,439.64
Totals.....	335,352	\$963,556.77	\$140,613.55

Total amount of ore was 407,670, the gross yield of which was \$16,825,851.86, and the net yield on which taxes are levied, was \$7,673,563.42.

The total amount of tailings was 335,352 tons, the gross yield of which was \$963,556.39, and the net yield on which taxes were levied, was \$140,613.55.

Total number of tons of ore and tailings was 743,023; gross yield, \$17,789,408.25; total net yield on which taxes are levied, \$7,814,176.97.

This exhibit for nine months is larger than the entire product of 1871. The *Enterprise* says:

Assuming that the last quarter of the year has given a yield equal to the average of the preceding three quarters, and the aggregate gold and silver product of the State reaches \$22,236,760.31. For a State with a population of but 50,000, this is doing well. The product is at the rate of \$444 for every man, woman and child in the State. The yield in 1871 was about \$1,000,000, which has been increased over \$4,000,000 in 1872. At the same rate of increase, the product of 1873 will be over \$26,000,000. This will place Nevada in the front rank of bullion-producing States.

The returns from Nevada for 1871 as prepared by Mr. Valentine, of Wells, Fargo & Co., amounted to \$21,177,046 in bullion; the product of 1872 from the same source, is set at \$25,548,821. As will be seen from the exhaustive report on the Washoe mines, from the *Gold Hill News*, in our "Mining Summary," everything in that locality is in a flourishing condition, and the production for the coming year promises to be immense. The lower levels of the prominent mines show large and rich deposits of ore. The ore developments in the Crown Point and Belcher are extensive, and seem to grow richer and larger as sunk upon. This being the case, all the other mines on the lode have good prospects of striking the same body. The Crown Point ore body which was found two years ago, is 120 feet wide on the 13th level, and its assaya average about \$150 per ton. It has been followed north and south in the two mines mentioned between 600 and 700 feet. The Crown Point mine paid in dividends this year, \$1,860,000, while the Belcher paid \$2,184,000, though the Crown Point ore body is the richest. Transportation and milling facilities have been temporarily interrupted at the Washoe mines, but now everything is running smoothly. Professor Clayton, a competent authority, estimates that the bullion yield of the Comstock lode this year will be not less than \$16,000,000.

Ely District

Is now only second to Washoe in bullion production on this Coast. The prominent mines and their characteristics are too well known to need much mention at this time, though it may be stated that it is estimated that the bullion yield of the Raymond & Ely alone will exceed \$4,000,000. It has paid about seven per cent. per month to its shareholders for some time past. Some considerable trouble is experienced in this district from bad titles and serious disputes have arisen from this cause. The hulkion shipments from the district are steady and heavy, principally from the Raymond & Ely and Meadow Valley mines. The *Pioche Record* has figured up the yield of the district at \$5,359,409.73, estimating the product of the last quarter at \$1,339,852.43. The gross yield of the mine for January 1st, 1871 to September 30th, 1872—21 months, is \$7,606,885.45. The figures compare as follows, the yield and increase for last quarter of the year being estimated:

	1871.	1872.	INCREASE.
1st. quarter.....	\$ 696,918.20	\$1,143,515.21	\$446,597.01
2d. ".....	615,316.55	1,459,353.93	844,037.38
3d. ".....	1,000,427.44	1,416,678.16	416,250.72
4th. ".....	1,276,065.96	1,339,852.43	64,786.47
Total.....	\$3,588,728.15	\$6,359,409.73	\$2,770,681.58

This shows an increase of nearly 50 per cent. on 1872 over previous year. The official figures show that the yield for the first nine months of the year 1872, exceed the total yield of 1870 by \$432,229.15. The *Record* makes the following peculiar estimate of the hulkion product.

Yield for 1872.....	\$5,359,409.73
" per month.....	446,617.47
" per week.....	103,065.57
" per day.....	14,723.65
" per hour.....	613.48
" per minute.....	10.22
" per second.....	.17

This is a very healthy showing, and the people of the district have cause for self-congratulation.

California Mines.

Without particularizing the districts in California, it may be said that they have enjoyed a season of prosperity, scarcity of water being the only drawback to our gravel mines, which has prevented a greater increase. The yield, as computed by Wells, Fargo & Co., is \$19,049,098. The placer mines are now reaping their harvest in this State, the late rains giving them the opportunity. As mentioned before, extensive hydraulic mines have been opened this year, which will help swell the product of the coming one. We will mention one quartz district alone for an example, and if each a showing can be made for this, many others are equally favored. The Grass Valley Union gives the following list of quartz mines actually at work in that district: Idaho, Coe, Eureka, Howard Hill, Empire, Greenhorn, Daisy Hill, Green Mountain, Jones, Slate Ledge (Perrin's), North Star, Independence Tunnel, Hunt & Talbot, Never Sweat, Knight of Malta, Sappho, Grass Valley Mining Company, Gahewill, Reese, Schuykill, Cedar, and others. In the way of gravel mines they have Town Talk, Independent, Enterprise, Phil Roberts & Co., Hope, Reuben Thomas, Dartmouth, Picayune, and others.

Utah

Has advanced this year more than any of the Territories. Her mines are doing well and large numbers of new ones have been found. Smelting furnaces and mills are being erected in every direction and thousands of tons of ore are being shipped away for reduction. She is wisely bringing her mining districts nearer to centers of population by a system of railroads and facilities for transportation are becoming greater every day. The amount of ore shipped from the Territory during the year 1872 was 10,347 tons and the amount of base bullion 5,653 tons. Value of silver bars \$6,000,000. This is what we learn by telegraph. Mr. Valentine estimates the yield of the Territory at \$3,521,020. Utah is fast taking a place in the front rank of bullion-producing regions and her prosperity is greatly increasing. The mining interests of

Colorado, Idaho and Arizona

Are prospering. In the latter place the Indian question being as yet unsettled, the mining districts are not so populous as they would otherwise be. Her ores are rich and abundant, and it has even been found profitable to ship them in considerable quantities all the way to this city for reduction. This is sufficient evidence of their value. The Indians being cared for as they should be, and Arizona becoming in that case a civilized place, we predict for her a most glorious future, as her mineral resources are known to be rich and varied.

The bullion yield of Idaho is set at \$2,514,090, and according to the Mint Director's annual report she has produced in all, exclusive of the latter part of last year the sum of \$17,141,523 in gold, since her mine was first opened. Colorado produced last year \$3,001,751. This Territory has suffered much for want of means of reduction and transportation, which, having been partially supplied, her prosperity is on the increase. We hear of new mines being opened, old ones more systematically developed, smelting works and mills being erected, and railroads built. This is sufficient indication of her prosperity without going into detail.

Mining Dividends for 1872.

During the year which has just closed thirteen mining companies paid dividends amounting in the aggregate to \$6,731,100. Belcher paid \$2,184,000; in January, \$104,000; in February and March, \$156,000; in April, \$208,000; and in May, June, July, August and September, \$312,000 each month.

The Cederberg mine paid three dividends: of \$12,000, or \$36,000 in all during the months of October, November and December.

The Chollar Potosi paid \$28,000 in January, and \$28,000 in February—\$56,000 in all.

The Crown Point paid \$1,860,000 in all; \$120,000 in January; \$180,000 in February and in March; \$300,000 in April; \$480,000 in May and \$300,000 in both June and July.

The Eureka paid \$40,000, of which \$20,000 was paid in January, and \$20,000 in December.

The Keystone Quartz paid \$30,000 during the year—\$7,500 in February; \$10,000 in March; \$7,500 in April, and \$5,000 in July.

The Mahogany paid \$15,000 in August.

The Meadow Valley mine paid \$360,000. Of this \$90,000 was paid in March and April, and \$60,000 in May, June and December.

The North Star mine paid \$27,000 in three dividends of \$6,000 each, during the first three months of the year.

The Pioche paid \$40,000 in two dividends of \$20,000 each—paid in July and August.

The Providence paid one dividend of \$3,100 in November.

The Raymond and Ely paid a total of

2,070,000 in eleven dividends—\$30,000 in January; \$150,000 in March; \$210,000 in April, May, June, July, August, September, October and November; and \$150,000 in December.

The Yale Gravel mine paid two dividends of \$5,000 each in April and May.

In 1871 there were dividends from eighteen Mining Companies. The amounts disbursed each month compare as follows:

	1871.	1872.
January.....	\$537,000	\$371,000
February.....	587,000	387,000
March.....	554,500	595,000
April.....	517,000	820,500
May.....	407,500	1,067,000
June.....	308,500	882,000
July.....	363,300	817,000
August.....	353,300	557,000
September.....	344,400	572,000
October.....	298,000	222,000
November.....	280,500	225,100
December.....	289,500	212,000
Totals.....	\$4,837,950	\$6,731,100

San Francisco University College.

This well-known institution, one of whose buildings is represented in the accompanying cut, is located on the corner of Geary and Stockton streets, in this city. The College was organized in 1859, in the basement of the old Calvary Church, which stood on Bush street, opposite the Cosmopolitan Hotel. It soon outgrew its accommodations there, and the present site on the corner of Geary and Stockton streets was secured. That part of the city was then in the "sand-hills," and the lot on which the College stands had a sand-bill on it nearly as high as the present college building.

The institution was for a long time known as the City College, and to many of the old patrons this is still the most familiar designation. In 1863, the charter of the institution was enlarged and its name changed to that of University College, probably after the example of University College of London. Its prosperity, from the first, has been one of the pleasant features of its history. It has not been without the trials and temporary reverses incident to similar institutions everywhere; but it has shown a vitality and vigor which entitles it to rank among the permanent institutions of the city and of the country. It possesses accommodations for at least five hundred students; is furnished with a laboratory and valuable philosophical and chemical apparatus, and an excellent telescope. It has a spacious yard in the rear, and an open-air gymnasium, for the exercise of students. There is no place in the city, or anywhere else on the Coast, where the mental, moral and physical welfare of boys and young men can be better promoted.

Under the Presidency of Rev. W. Alexander, aided by his efficient colleagues, the institution is rapidly attaining a high degree of prosperity in all its departments. It has extended its facilities so as to be in fact a University. It is the design of its Boards, both of Direction and of Instruction, to make it in all respects a first-class institution. Its plan is broad and comprehensive, providing for the entire education of youth, from the primary school up to the professional schools for Commerce, Medicine and Law. These various departments have been organized, and are now in successful operation.

The Pacific Medical College constitutes the Medical Department of the University. All information relative thereto will be furnished by Dr. Henry Gibbons, Jr., Dean of the Medical Faculty.

The City College—the Literary and Scientific Department, is under the more immediate supervision of the President, Prof. Alexander. He is aided by Professors Kirkland, Robinson,

Price and others of experience and high reputation. It is open to students of all grades, from boys of eight or ten years of age to young men in College. The new session commenced on Monday last, January 6th.

The Pacific Business College constitutes the Commercial Department, to which the whole east end of the building is devoted. This is the oldest and best Commercial School on the Coast, and the only one in which a thorough knowledge of business is taught. Business Colleges were for a long time regarded as a humbug; and it must be confessed that the prejudice was not without foundation. At first most of them were, and many of them still are, exceedingly superficial. Business-men found that young men who had passed through those Colleges had nearly everything yet to learn, while they sometimes had much to unlearn. Still, a want was felt for some means by which young men could be fitted for business pursuits, as they were for the so-called learned professions. By degrees the course of study was enlarged and made more practical and thorough, until now business-men can find in the halls of University College young men fitted for the store, the mill, the bank, the railroad or telegraph office, or any

business training. Such an institution is of great benefit to young men desirous of gaining speedy admission to business circles and promotion to responsible and lucrative positions; and the business men of San Francisco show that they feel an interest in the welfare of the young men of the Pacific Coast by affording them facilities for acquiring a knowledge of the customs and laws of trade and commerce under their own immediate sanction.

The Commercial Department enjoys the personal supervision of Prof. M. K. Lauden, who has had a large and successful experience in the management of business colleges, and as an expert accountant probably has no superior in the city. None but the most experienced and thorough instructors are employed, and young men who wish to acquire a thorough knowledge of business, will always find it for their interest to take a full course in the Pacific Business College. So little do most young men know of practical affairs who have even graduated from almost any of the colleges of the land, that they often find it necessary to take the business course afterwards.

For the convenience of those young men in the city who find it necessary to earn their own living, the college is open in the evening

Popular Lectures.

In another column will be found a synopsis of the first of the lectures which are to be delivered before the Mechanic Arts College, by the Professors of the State University. The President of the University, Prof. Gilman, seems already to be better posted on the requirements of the State, in an educational point of view, than many who have long resided here. His remarks possessed a local interest hardly to be expected from one comparatively a stranger in our city, for not only were the "Polytechnic schools of America and Europe compared," as was announced, but the special wants of California were considered. The choice of Professor Gilman as President of the University, we always thought a happy one, and he is fast proving his worth to the general community by his unceasing labors and interest in local affairs.

The lecture course of the past two years were eminently successful, and this one opens in a manner to leave no doubt but that the efforts of the Professors of the University and the Trustees of the Mechanics' Institute, to afford instruction in a popular manner, will be fully appreciated. The attendance was good,

and the audience attentive, the size of the hall alone preventing a great distribution of tickets.

A series of Thursday evening polytechnic lectures are to be delivered at the Mechanics' Institute Hall, in this city, this winter, the first of which will be given on Thursday, the 16th inst. The lectures are all upon matters of local interest. These lectures, in connection with the others now being delivered on Saturday evenings, by the Professors of the State University, will do a great deal of good in our community.

Popular lectures are doing much towards increasing the intelligence of the masses throughout the Union. Whatever affords means of instruction to any portion of a community benefits all the race.

UNIVERSITY COLLEGE, SAN FRANCISCO.

other department of practical business.

Among the men who are interested, as Trustees or patrons of this enterprise, and who recognize the importance of providing for the training of the future business men, merchants, and bankers of the country, no less than of the lawyers, doctors and clergymen, may be named, Hon. Thos. H. Selby, President of the Board of Trustees and Ex-Mayor of the city; Hon. H. P. Coon, an Ex-Mayor; Hon. H. H. Haight, Ex-Governor of the State; J. D. Thornton, Esq., of the law firm of Thornton & Williams; D. O. Mille, Esq., and W. C. Ralston, Esq., of the Bank of California; Rev. W. A. Scott, D. D. LL. D., of St. John's Church; Rev. John Hemphill, of Calvary Church; Rev. T. M. Cunningham, D. D., of the new Central Church Tabernacle; N. G. Kittle, Esq., of the firm of Kittle & Co.; A. Hemme, of Hemme & Rhein; Louis Sachse, of L. & M. Sachs, importers, etc., and many others of the most prominent men in the State and county.

The illustration herewith presented gives an accurate representation of the buildings, which occupy an entire 50-vara lot. The main building fronts upon Geary street, the left wing being appropriated to the Commercial and the right to the Academic department. Following the perspective down Stockton street, the laboratory is seen, which is a substantial brick building well-fitted for its purposes. Beyond that in the building surmounted by the smaller cupola is the Medical department.

Young men will here find a place where they may be sure that they will receive a proper

from seven till nine o'clock. Many young men complete the course in a few months by devoting their evenings to study. Boys who are too young for business, or who need some further instruction in English studies, or Modern Languages, can enter the Academic Department first and then take the business course when they are properly prepared for it. This is a practical age and country, and the place for obtaining a good practical education is in the Business Department of University College.

The College is without doubt one of the leading educational institutions of the city, and is deserving of the generous patronage it receives. Its Faculty and Trustees embrace in their numbers some of the ablest men in California; and its patrons include among them many of our most prominent and wealthy citizens. Prof. Alexander, the President, will be pleased to give any information that may be desired in relation to any of the departments. Persons wishing further information about the Business College can apply to the Superintendent, Prof. M. K. Lauden.

PLACER MINES.—We intend shortly publishing a series of very exhaustive articles on placer mines, from the pen of one fully competent to handle the subject well. The illustrations are now being prepared and we advise all interested to save copies of the papers containing the article, as it will be valuable for future reference.

THE Naval bill, as reported, appropriates \$18,884,993.

In this connection it may be mentioned that Dr. E. S. Carr, Professor of Agriculture in the State University, who has proved a versatile and popular lecturer, has received a call from a number of persons engaged in mercantile and industrial pursuits, through the columns of the *Oakland News*, to deliver a series of lectures in that city, on appropriate subjects. Professor Carr's activity in lecturing has already been productive of much good, creating a taste for such instructive amusement. We are sure he will deliver an interesting course of lectures which will be fully attended and appreciated.

SILVER COINAGE.—The Finance Committee of the Senate propose an important amendment to the bill "revising and amending the law relative to the mints and assay-offices and coinage of the United States," as it came from the House. This proposed amendment provides for a trade silver dollar of the weight of 420 grains troy; a silver dollar weighing 12½ grains, and a quarter dollar and dime respectively, one-half ounce and one-fifth the weight of the 50 cent coin. A correspondent of the *Bulletin* has been informed by the Comptroller of the Currency that this increases the weight of the existing coinage one-half of one per cent. The present silver dollar is abolished and the "trade dollar" of 240 grains is authorized, and is slightly in excess in weight of the Mexican dollar.

SAN DIEGO FOUNDRY.—The first run of metal at the new foundry at San Diego, was made on the 8th, very successfully.

DOMESTIC ECONOMY

Table Use of Oatmeal.

Oatmeal Breakfast Cake.

This is made of No. 2 oatmeal, with water enough to saturate it, and little or no salt. Pour it into a baking tin half an inch or three-quarters deep, shake it down level, and when this is done it should be so wet that two or three spoonfuls of water should run freely on the surface. Put it in a quick oven and bake twenty minutes. Eat warm. It will be as light and tender as the best "Johnny cake," or else you have wet it too much or baked it too long. This is one of the most accommodating baked dishes that can be made. It will do very nicely with a little longer time if the oven is not quite hot. If it will not bake there at all, pour it into a frying pan, cover it close and set it on the top of the stove where it will even bake in fifteen minutes.

For a hurried breakfast and a slow coal fire it is invaluable. Scarcely any wholesome thing in the whole bread line can be prepared more readily. It can be made still thinner and baked quicker. It is good either crisp or moist. For emergencies alone every housekeeper will find it convenient to be able to make the breakfast cake. Many use oatmeal mixed with buckwheat, wheat or corn for griddle cakes. For this use I prefer it cooked first. Take say one-half pint of the porridge or the mush, diffuse it in one quart of water and add the wheat meal, sifting it in and stirring slowly.

Oatmeal Pie Crust.

A long trial proves the thorough adaptability of oat meal for that purpose. Take No. 1 meal, if possible, wet with half its measure of hot water. It can be easily rolled thin enough; it will swell but little in baking. It is not so white as those pie crusts made of white flour, and to the unaccustomed eye not so attractive, though that is a matter of taste. To my notion they are far preferable, even in appearance to the crusts soaked in hog's lard, which here in the city have earned themselves the suggestive sobriquet of "scabs," and they are certainly far more wholesome than any shortened pie crusts whatever.

To avoid the unaccustomed appearance, however, tarts, pies, and fruit and berry pies of many kinds can be without the upper crust or the upper crust can be removed after baking. Blackberry, raspberry, plum, peach, grape and many other kinds of pies can be made in this way. The crust bakes very quickly, so that any kind of fruit that requires much cooking should be cooked before it is put in. It also makes very pretty ornaments cut in various shapes with cake cutters, and laid upon the surface of tart pies; is agreeable to the taste, and very few persons would notice the difference when made without an upper crust. As people come to recognize its wholesomeness they will probably be brave enough to eat it openly.—*Science of Health.*

Beef Soup.

A correspondent of the *American Rural Home*, says: "I have eaten beef soup at some houses where it would be watery and tasteless, evidently containing no vegetable but potatoes, and with little seasoning, which mixture I never could relish. But this is only a counterfeit of the genuine beef soup which is a delight to the epicurean. The way to make it is thus:

"Take a small joint of beef, (one which can be purchased for a shilling or fifteen cents is large enough,) and put in a kettle containing about four quarts of water—rain water is best if it can be obtained pure. Be sure to put it in while the water is cold, then put it over the fire, and let it boil for three or four hours. Then take about eight good sized potatoes, four parsnips, two carrots, six or eight onions, and a small cabbage; after paring the potatoes and onions, and scraping the parsnips and carrots, chop the whole together, adding a little summer savory if it suits the taste, and put it in the kettle to cook. If rice is preferred for thickening it must be boiled by itself and then added to the soup; but instead of rice, the white of an egg rubbed in flour until it crumbles into small pieces, is thought best by some; either is good. Soon after the vegetables are put in, add the salt and pepper, and let it all cook an hour longer, when it will be ready to serve. If any of the vegetables mentioned should be distasteful to one of the family it can be omitted, putting in more of another kind, if thick soup is desired."

IRONING WITHOUT HEAT.—A lady of experience says that much time and trouble may be saved by "ironing" without heat and flatirons. When rinsing the cloths, fold coarse sheets, towels and table cloths in the shape they are wanted, and pass them through the wringer as tight as possible. Unfold and hang to dry where the wind does not blow very hard. They will need little or no ironing. The table cloths should be dipped in old, sweet, skimmed milk; this gives them a luster, and they need no starch.

CUCUMBER SAUCE.—An excellent sauce may be made by cutting a cucumber and onion as small as millet seed, and adding a teaspoonful of cayenne pepper, a wine-glass of Madeira, the same of vinegar, and a little salt.

Resources of Utah.

The following is the first installment of a valuable series of articles, from the Salt Lake Tribune, which our readers would do well to preserve to mail to their friends. It will shortly be followed by others, which will extend through several numbers of the Tribune:

FURNACES, SMELTING WORKS AND STAMP MILLS.

BADGER STATE WORKS,

On State Road, south of Salt Lake City, built in the spring of 1871; one blast; capacity, fifteen tons per day; ores treated from Little Cottonwood, Parley's Park and Bingham cañon; A. Robinson, proprietor.

WASATCH SMELTING WORKS,

On the U. S. R. R., seven miles south of Salt Lake City; incorporated in New York; capital, \$100,000; two blasts and one reverberatory; capacity, forty-five tons per day, to work custom ore; R. P. Lounsbury, Treasurer.

W. & M. ROBINS' SMELTING WORKS,

On State Road, seven and a half miles south of Salt Lake City, at Little Cottonwood creek completed May, 1871; has one calciner; capacity fifty tons per day for high grade ores; also one reverberatory.

SATURIN MINING COMPANY,

(Limited.) Sandy Station, on U. S. R. R., fifteen miles south of Salt Lake City; incorporated in England; capital, £75,000; has three cupola blast furnaces, six feet Sturtevant blower, No. 9; thirty horse power engine; capacity, twenty tons per day each furnace; two in constant operation; engine and furnaces under one roof; cost of furnaces and buildings, \$20,000; location admirable; all ores smelted are purchased in market; have lately been working ores from the Emma, Vallejo and Winsor Mining Companies. In twenty-six days immediately preceding the 18th of December, 1872, the works turned out 365 tons of bullion, equal to fourteen tons per diem. The average quantity of silver to the ton in the above batch was 160 ounces. G. M. Gerrish, Superintendent.

FLAGSTAFF SILVER MINING COMPANY,

(Limited.) incorporated in London, capital, £300,000; two furnaces, capacity, ten tons each per day. Situated at mouth of Little Cottonwood Cañon; built by Buel & Bateman in 1870; a third furnace building; working Flagstaff ores. J. A. H. Patrick, Superintendent.

WELLINGTON MINING AND SMELTING COMPANY,

Little Cottonwood; one furnace, capacity, eight tons per day; built by Jones & Pardee, sold to Wellington Co., incorporated in San Francisco, January, 1872; ore worked, Wellington mine and custom; approximate production by company, 110 tons of bullion; value, 225 ounces, of silver, gold and lead, \$350 per ton. R. Y. Andersou, Superintendent.

MONITOR FURNACE,

Union Fort, mouth of Little Cottonwood; built in 1871; T. R. Scheuner, proprietor; patent force blast smelting furnace, capacity, 10 to 15 tons per day.

UTAH SILVER MINING COMPANY,

(Limited.) Bingham Cañon; incorporated in London; two furnaces, one of the capacity, of 15 tons per day, the other 30 tons per day, and two roasters each 35 feet long; ore worked from the Red Warrior, Portland and other mines. J. R. Murphy, Superintendent.

WINAMUCK COMPANY,

Bingham Cañon; two furnaces, capacity, eight tons per day each; erected by a company from New Haven, Connecticut; Daggett and Bristol, Superintendents.

SULTANA SMELTING WORKS,

American Fork Cañon; three furnaces, two built in 1871. Ore worked from the "Miller" mine; bullion at first, sixty-seven ounces per ton; later, one to one and a half ounces gold in addition; lead pure; Edmund Wilkes, Manager.

UTAH SMELTING AND MINING COMPANY,

Homansville, Tintic District; incorporated in Utah; capital, \$30,000; completed June, 1871; two furnaces; capacity, twenty tons per day each; working ore of Scotia mine, West camp, Tintic District; production, 1,200 tons of bullion; average, 125 ounces silver and one and a half ounces gold per ton; Joah Lawrence, President; T. S. Clarkson, Treasurer.

TINTIO SMELTING COMPANY,

Diamond City; completed October, 1871; built by Hopkins, Parsons & Co.; two furnaces; capacity, twenty tons per day; treating ore from the Shower mine; Charles Pointer, Superintendent.

WATERMAN SMELTING WORKS,

Stockton; two cupolas and blast, completed May, 1871; work ore from Hidden Treasure, (St. Louis) from Dry Cañon, and St. Patrick, Grand Cross and Metropolitan, Stockton mines; about 330 tons of bullion, average 120 oz. silver per ton. Superior lead. Isaac S. Waterman, Philadelphia, proprietor; Henry Simmons, manager.

OPHIR UPPER SMELTING WORKS,

East Cañon; built by Mr. Raymond in the fall

of 1870; two cupola blast, capacity twenty-five tons per day; ore worked from Sevier, Last Chances and other mines in Ophir district; about 200 tons of bullion in the last six months. Isaac S. Waterman, of Philadelphia, proprietor.

OPHIR MINING AND SMELTING WORKS,

East Cañon; incorporated in Utah; one furnace completed July 4th, 1871; one building; capacity, fifteen to twenty tons per day; working Fairview and other mines; one run of forty tons of bullion averaged \$165 to the ton; E. J. Ryan, superintendent.

UTAH MINING AND SMELTING COMPANY,

East Cañon, incorporated in London, England; capital stock \$500,000; steam jet furnace, completed June, 1872; capacity, fifteen tons. Intention to build large mill, reduction and smelting works. Mines to be worked: Miner's Delight and other claims. E. S. Blackwell, manager.

H. S. JACOBS & CO.,

Stockton, Tooele County; three blast furnaces; engines forty-horse power; capital \$200,000; to work ores from Dry Cañon and Stockton mines, Rush Valley District. H. S. Jacobs, manager, and H. S. Durkse, assistant.

GILBERTSON & BERRY'S,

Deep Creek, built 1872; one furnace; thirty tons bullion sent to Salt Lake City averaged \$93 silver per ton.

WARM SPRINGS SMELTING WORKS,

Salt Lake City, built in 1870; one blast and reverberatory; capacity, twenty tons per day; ores worked from Little Cottonwood, East Cañon, Parley's Park and Bingham Cañon; F. J. P. Pincose, proprietor.

REGISTER SMELTING AND REFINING CO.,

Ogden; one furnace; built in fall of 1871; ore worked from East Cañon mines; Mr. Purnall, manager.

ALGER REDUCTION WORKS,

Corrinne; built in 1871; Henry Sanger, proprietor.

STAMP MILLS.

PIONEER MILL, WALKER BROS.,

East Cañon, fifteen stamps, power for twenty-five; capacity, twenty-five tons per day, dry crushing; erected July, 1871; Aiken furnace just completed, same capacity; ore chloridized to 86½ per cent.; first run Tiger ore, thirty days produced \$33,000; silver bars, .991 to .997 fine. Working ore from Tiger, Zella, Rockwell and other mines. Lion Hill cost about \$60,000. Lathrop Dunn, Superintendent.

EUREKA MINING COMPANY OF UTAH,

Homansville, Tintic District; incorporated in Utah, capital \$500,000; twelve stamp; capacity, twenty-four tons per day. Working ores from the company's mines, Eureka Hill. Joab Lawrence, President.

BREVORT MILL,

East Cañon; steam battery; capacity ten to twelve tons per day, custom ore.

CHICAGO COMPANY'S MILL,

Ohio District, near Sevier river; steam battery, capacity six to eight tons per day; working ores from the company's mines.

CAMP FLOYD SILVER MINING COMPANY, (LIMITED.)

Incorporated in London, England; capital, £120,000; twenty-stamp mill, thirty tons per day capacity; power and machinery for thirty stamps; a forty ton Aiken roasting furnace; treat ores from Sparrow Hawk, Last chance and Marion mines belonging to the company. E. H. Shaw, Managing Agent; E. B. Wilder, Superintendent.

MINERAL RESOURCES.

The mineral resources of Utah are extraordinary in their diversity and extent, and afford an inexhaustible field for enterprise worthy the attention of science and capital. Among them are the ores of all the principal metals, together with many of the rarer minerals.

GOLD

Is found in several districts, both in the form of gold quartz, in placer mines, at Bingham Cañon, and more or less associated with the argentiferous galena of the Territory, especially in the ferruginous ores of Big and Little Cottonwood and Bingham Cañons.

SILVER

Is found in the native state, but not in large quantity. In its various ores, however, it occurs almost all over the Territory, associated with other ores, such as those of copper, lead, antimony, arsenic, etc. It occurs in small quantity in the form of dark ruby silver, (antimonial sulphuret) and light ruby silver, (arsenical sulphuret) at Butterfield and Black Jack Cañons in the Oquirrh range of mountains; as horn silver, chlorobromides and iodides, in East Cañon, Dry Cañon, Tintic and in the Star, Sevier and other districts in Southern Utah. In combination with lead it is broadly distributed over the Territory, especially in the Cottonwood and Stockton Districts. It is found with copper at Tintic, Star District and the northern part of the Territory

LEAD

Is widely disseminated, being found in the form of argentiferous galena and carbonate of lead in nearly all the mining districts of the Territory, and occurring in large bodies in the Cottonwood, Bingham, Stockton and Lake Side Districts, notable in the celebrated Emma, Wellington, Flagstaff and other mines in Cottonwood, and in immense bodies, though en-

riching less silver in Bingham Cañon and Rush Valley. It occurs chiefly as carbonate of lead, as sulphate of lead (antimonial, arsenical, cupiferous, and argentiferous). In small quantities as sulphate, sulphate-carbonate, chloro-arsenate and chloro-phosphate of lead.

COPPER.

Ores of copper, though hitherto not much sought after, are abundant throughout the Territory. Copper is found in the native state in small quantities at Ophir, Tintic, and in Southern Utah, but it occurs chiefly as malachite, azurite (green and blue carbonates) silicate of copper, vitreous copper ore (sulphuret) and peacock ore. Ruby copper (sub-oxide) is found at Bingham Cañon whence also a considerable quantity of native copper has been panned from the creek. Most of these ores contain silver in variable proportions and some also carry gold; the ore from the Mammoth Copperopolis mine at Tintic containing considerable gold. Some of the specimens of azurite and malachite constitute the most beautiful of Utah's minerals, some of the pieces of malachite comparing favorably with that found in the Ural mountains in beauty and only wanting in size.

IRON ORES

Are very plentiful and of excellent quality, covering a large portion of the Territory. Excellent hematites are found in the South, also in Cottonwood cañon, and Skull and Rush valleys; good iron ores are also found in Weber and Cache valleys, and Iron and Washington counties. Magnetic iron ore is found in the Cottonwoods and also associated with Spathe iron in Rush valley. Smelting operations, on a limited scale, were about four years ago commenced in Iron county, but owing to the want of superior fuel, reduction was discontinued, but has since resumed. A fine quality of micaceous iron ore is found in Cache county.

BISMUTH ORE

Is found in Beaver District, but not sufficiently rich to pay for reduction with previous concentration. Sulphide of cadmium also occurs with it.

CINNABAR

Is found at Camp Floyd, and realgar and orpiment in a very pure form in Black Jack Cañon in the Oquirrh Range. The sulphuret of antimony, which is the principal ore from which the metal is extracted, is found here in considerable quantity.

PYROLUSITE

(Peroxide of manganese) is associated with several different minerals in Provo, Snake Creek, etc., while graphite, black lead, native sulphur, and especially iron pyrites, alum, borax, nitrate of potash, sal ammonia, carbonate of soda and gypsum are disseminated over the Territory.

COMMON SALT

Exists in enormous quantities, the lake itself being an immense reservoir from whence very large crystals can be had, and large bodies of rock salt are found in the south, one variety being tolerably pure and available for diathermal purposes.

MARBLE.

Fossiliferous lime stones (bird's eye and figured marbles), from Provo Valley, and other parts of the Territory have been worked to a limited extent. Quartz crystals occur, frequently in clusters, both colorless, amethystine and different shades of brown.

OF VOLCANIC PRODUCTIONS

There are nimple remains, as witnessed by the porphyry, trachyte, lava, pumice, and obsidian contained in Utah. Some beautiful specimens of obsidian have been found which might almost rank with gems, and among them might be placed chrysocolla, opals, chalcedony, onyx, and a host of other beautiful minerals too numerous to mention. Asbestos, fuller's earth, and petroleum have also been discovered. Among gems proper, have been found rubies, (the large ones inferior to the smaller,) beryl, and white topaz.

With the continued development of the resources of the Territory, new treasures will doubtless be discovered in Utah. The foregoing statement is of itself sufficient to prove how seemingly inexhaustible is the hidden wealth of this country.

COAL,

Said to be of good quality, is found in various parts of the Territory, and has been worked for some time past in Weber Cañon. It is generally lignite, but the coal found at San Pete is bituminous, and yields a superior quality of coke. From recent developments, the southern portion of Utah appears to be well supplied with coal—a most important item in a smelting and manufacturing district.

FIRE CLAY

Of a superior description is raised a short distance north of Salt Lake City; Mr. Pincose being the proprietor of the bed, while in Bingham cañon are large deposits of fire-clay, owned by Mr. Cotton, Messrs. Morris & Evans and others. A species of quartzite or sandstone, found in Red Butte cañon, near Camp Douglas, within a few miles of Salt Lake City, is also owned by the last-named firm, who supply for the erection of blast furnaces; and from competitive trials of well-selected stones, with the firebrick used in Utah, it bears a good comparison. Clays, suitable for pottery-ware, abound, and in the neighborhood of Ogden and of San Pete; Kaolin, for china-ware is plentiful; building

EUCALYPTUS.
The attention of the Medical profession is respectfully
called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of Intermittent and Marsh
Fever, often supplanting the use of Quinine. The
paroxysms of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Blad-
der it seems to act like a specific.
FLUID EXTRACT EUCALYPTUS.
This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus
THE ELIXIR OF EUCALYPTUS.
This compound presents the properties of the leaves
in a palatable form and elegant appearance. Dose—
One tablespoonful, to be repeated as often as the case
demands.
Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular row between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.
Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco

JOHN TAYLOR & CO.,
IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,
512 and 514 Washington street, SAN FRANCISCO
We would call the special attention of Assayers
Chemists, Mining Companies, Milling Companies
Prospectors, etc., to our large and well adapted stock of
ASSAYERS' MATERIALS
—AND—
Chemical Apparatus,
Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast.
Our Gold and Silver Tables, showing the value
per ounce Troy at different degrees of fineness, and val-
uable tables for computation of assays in Grains a
Grammes, will be sent free upon application.
7v25-1f JOHN TAYLOR & CO.

To Mill Men and Miners.
I am now manufacturing
CYANIDE OF POTASSIUM,
Which I can sell upon better terms than any other
dealer on the Pacific Coast.
I make three grades or qualities to suit the require-
ments of different consumers.
I will be glad to furnish prices to any person ad-
dressing me on the subject.
HENRY G. HANKS,
Manufacturing Chemist,
PACIFIC CHEMICAL WORKS, SAN FRANCISCO
24v25-1f

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.
Declared by Connois-
seurs to be the only good
SAUCE
Caution Against Fraud.
The success of this most
delicious and unrivalled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way
to secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.
Some of the foreign markets having been
supplied with a spurious Worcestershire
sauce, upon the wrapper and labels of which the names
of Lea and Perrins have been forged, L. and P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-
ter; Cross & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. 15v24-1f

L. SCHUMANN,
PIONEER
Meerschium Pipe Manufacturer,

No. 341 KEARNY STREET,
Between Bush and Pine streets, San Francisco
The first and only Manufactory on the Pacific Coast.
MEERSCHAUM MOUNTED WITH SILVER. Meerschium
Pipes Bored and Repaired. Amber Mouth-pieces Fitted.
Betts's Capsule Patents.
To prevent infringements, notice is hereby given, that
Betts's name is on every Capsule he makes for the principal mer-
chants in England and France,
thus enabling vendor, purchaser, and consumer not only to
identify the genuineness of the article, but also to know
the contents of the vessel to which it is applied.
The LORD CHANCELLOR, in his judgment, said that the
capsules are not used merely for the purpose of the con-
tents, but that they are serviceable in protecting the wine
from injury, and insuring its genuineness.
MANUFACTURERS:—1, WHARF-ROAD, CITY-ROAD, LON-
DON, AND BORDEAUX, FRANCE.

Through WEBSTER & Co., 17 New Montgomery street,
SAN FRANCISCO, CAL.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Jan. 7th, 1872.

SEWING-MACHINE.—John H. Mooney, S. F., Cal.

ORE-CRUSHER.—William P. Hemmond, as signor to himself and Henry Mygett, Napa, Cal.

LOADING AND UNLOADING WAGONS.—Richard Threlfall, Centerville, Cal.

STEAM BOILER.—Frank A. Huntington, S. F., Cal.

CUTTING TOOL FOR TURNING LATHES.—Charles Rahskopf, S. F., Cal.

FEATHERING PADDLE WHEELS.—John Ch. H. Stut, S. F., Cal.

DEVICE FOR LUBRICATING SHAFT BEARINGS.—Jerome Haas, Stockton, Cal.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. Note.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

California Academy of Sciences.

The annual meeting of the Academy was held on the 6th inst., President George Davidson in the Chair. The attendance was large and considerable interest was manifested in the affairs of the Association. The membership of the Academy is now larger than it has been since its foundation, and the financial affairs are in a more prosperous condition. The only drawback at present is the impossibility of displaying the extensive collections, on account of want of space. More room is necessary but at present the Academy is not able to change its quarters.

The following new members were elected: S. B. Boswell, C. P. Morgan, Theodore A. P. Brown, Dr. P. Hatch and Robert M. Brereton (life member.)

Annual Reports.

The report of the Curator of the Museum, Mr. H. G. Bloomer, was read and contained a full list of the donations received during the year, with the names of the donors.

The report of the Treasurer, Elishe Brooke, showed the total income of the year to be \$2,702.35; expenditures, \$1,133.90; balance on hand \$1,568.45.

The report of the Curator of Entomology, Harry Edwards, was an elaborate document, and contained an account of the progress made in entomological research on the Pacific Coast, and what was being done elsewhere.

Dr. C. N. Ellinwood, the Librarian, made a few remarks on the condition of the library.

The President's Address.

Professor Davidson then delivered his annual address, from which we make a few extracts, as want of space forbids our giving it in full:

In the last few years our balance sheet, at the annual meeting, generally showed a minus quantity, even after the most rigid economy and self-denial. If a few dollars surplus was discovered, the members indulged in sanguine congratulations and bright visions of the future. But for the last twelve months our financial exhibit is more favorable than we dared hope, the Treasurer's account showing a balance of over \$1,500 in our favor.

Excellent Influence of Agassiz.

A livelier interest has been awakened among our citizens having scientific instincts, and willing to aid us by their membership and encourage us by their attendance. This healthy manifestation was very notably developed by the presence of Professor Agassiz, who arrived from his natural history voyage around the Americas, and exhibited, as he felt, the liveliest interest in our efforts. That he fully appreciated the labors of the Academy is shown by the fact that he had the whole of one volume of our proceedings transcribed because there was but a single copy of that volume belonging to the library.

His stirring appeal in behalf of science at the reception given to him by the Academy, aroused the dormant desire for scientific study and investigations, and we trust that our efforts will steadily maintain it. In the last twelve months, 78 resident and corresponding members, and eleven life members, have joined the Academy; and by death, resignation and non-payment of dues we have lost 29. But of those dropped for non-payment of dues, so many date back for three years that only one-third of the above can really be charged to this year.

Suggested Change in the Library.

In one respect the Academy is sadly deficient. Its library is small, very far from full, not well arranged, and requires systematic cataloguing. Much material collected on the Coast cannot be described for want of works of reference,

end of necessity must wait description or identification, or, as I have said, when the credit comes to others. Where we cannot secure books by exchange, it is indispensable to our success that we purchase, and yet the means at our disposal will not permit this beyond the most restricted limits.

How to Maintain the Reputation of the Academy.

But we are now in a condition where success seems assured, if we but continue our efforts. To maintain our claim as a scientific body, I earnestly appeal to each and every one in his specialty to make a resolution unto himself, that he will furnish not less than two papers of original investigations during each year. This will insure more than one paper of interest at each meeting, besides the usual verbal and short communications. Many of these papers will necessarily have important bearings upon the material interests of the Pacific States. The forests, the fisheries, the mines, the agriculture, the manufacture and commerce of the country afford ample fields for technical investigation, leading to the best practical methods of production and development. In no department of art and manufacture, agriculture and commerce, can the most profitable results be obtained except through purely scientific investigations and deductions, and it is our duty, as it is our pleasure, to demonstrate its ultimate practical money value, if we seek support from those who reap the rewards without the labor. The enormous waste of material, of labor and of time seen in nearly every workshop and manufactory, in every locomotive and steamship, in every mine and work of improvement, prove that scientific knowledge and method are lacking. When the valleys have been overtaxed and the impoverished soil yields a bare livelihood, the teachings of chemistry will be sought and must be heeded to make them again remunerative; when the forests have been depleted—as they are being at the rate of hundreds of square miles per year on this coast—the botanist will be asked to designate the best trees to replace those destroyed. With proper methods we need not ship any of our ores to the East or to Europe for reduction.

It is gratifying to the Academy to know that some of the papers read during the year have been largely copied abroad in advance of our regular publication not only for their scientific but for their practical value. And we may be proud that two of our active members are editing such works as *Stretche's Illustrations of the Zygocida and Bombycidae of North America*, and *Scammon's Natural History of the Cetaceans and other Marine Mammals of the Pacific Coast of America*.

Question of Finance.

But a practical question stares us broadly in the face—the financial success of the Academy. We need room to properly exhibit to the members and to the public our present collection and its prospective additions; we need a larger number of scientific works and the proper means of keeping them; a good supply of the current literature of Europe and the East; means and facilities for investigations.

We need funds sufficient to make some remuneration for the services of Curator of the Museum, Librarian, Secretary, Janitor, etc., and for the publication of our proceedings. Our present receipts will warrant us in seeking more commodious quarters, but nothing more. The Trustees have had these matters seriously at heart, and have received the opinions of many of the members. For some months they have been engaged in seeking for a larger and better building, but thus far with no success. To merit the confidence and an increased liberal support of our friends outside the Academy, the members must make the proceedings of each meeting instructive, and therefore interesting and attractive.

Election of Officers.

The Academy then proceeded to the election of officers for the coming year, the result being virtually unanimous. President, Prof. George Davidson; Vice-President, John Heuston, Jr.; Treasurer, Elishe Brooke; Corresponding Secretary, Henry G. Hanks; Recording Secretary, Charles G. Yele (of the MINING AND SCIENTIFIC PRESS); Curator of the Museum, H. G. Bloomer; Trustees, Robert E. C. Stearns, D. D. Colton, T. P. Madden and Oliver Eldridge; Librarian Dr. C. N. Ellinwood. Messrs. Davidson, Brooks and Yale are ex-officio Trustees.

Dr. Stont presented an interesting paper on the chemistry of great fires, which want of space prevents our publishing.

Meetings and Elections.

THE MINERS' PROTECTIVE ASSOCIATION have elected the following officers for the ensuing six months: President, A. N. Nelson; Vice-President, Wm. Sievers; Treasurer, Henry Meyers; Recording Secretary, Jason D. Wheeler; Financial Secretary, H. H. Subling; Trustees—Henry Scherling, Wm. O'Brien and Robert Parks.

GOLD & CURRY M. Co., Trustees—James G. Fair, Wm. S. Lyle, L. S. Rose, Geo. Congdon, Robert Sherwood, Edward Barron and J. C. Flood (President); Robert N. Graves, Superintendent; A. K. Durbrow, Secretary. The stock of this Company has been increased from \$2,400,000, in 4,800 shares, to \$4,800,000, in 9,600 shares, of \$100 each. The Secretary's report for the past year showed the receipts of the Company to have been \$378,644, mainly from assessments and the disbursements, \$342,795. Total assets, \$150,947, against \$706 liabilities. CAMERON OLD M. Co.—Dec. 26th. Trustees—A. W. Whitney, J. Clem Uhler, Samuel D. Kreider, Wm. H. Ashton and Alex. Cameron. President, J. Clem Uhler was elected President; Alexander Cameron, Superintendent, and Frank L. Kreider, Secretary.

COE M. Co.—William Blanding, President; J. H. Stevens, Vice-President; O. A. Treadwell, Treasurer; A. Treadwell, Secretary, and J. L. Hull, Superintendent. ANGELO M. Co.—Jan. 3. William Blanding, President; C. J. Alex. Cameron, Vice-President; G. A. Treadwell, Treasurer; A. Treadwell, Secretary.

Alta White Lead Works.

New Process for the Manufacture of White Lead.

Last week, by the kind invitation of the President of the above works, Mr. Otto Kloppenburg, we accompanied him on a visit to the extensive manufactory which this Company has just erected in the Visitacion Valley, on the shore of San Francisco bay, and nearly opposite the Six Mile House, on the San Bruno road.

The building is large and evidently well adapted for the purpose for which it was intended. The size of the main structure is 150 feet in length by 50 feet in width, besides which, there are other sheds connecting with the larger edifice.

Mr. C. C. Rueger, the Superintendent, took us over the premises and explained the different uses of the machinery employed in the manufacture of white lead.

One of the most novel features in this establishment is the furnace, which is on an entirely new principle, and is so constructed that it consumes the greater portion of its own smoke, while the residue and the gases from the other furnaces are conveyed by underground pipes to the smoke stack which is on the outside of the building.

The drying rooms are two in number, and consist of two systems of endless bands running over rollers so arranged as to carry the material from the washing tanks, and after discharging it from one set of hands to the other, finally empties it into a conveyer which then carries it into the mill, where it is ground with oil and rendered fit for market. Between the endless hands a system of steam pipes are introduced which gradually dry the lead. The water of condensation is then carried back into the boiler, thus saving considerable fuel and labor of pumping.

In one portion of the building is erected a smelting stove, which is capable of granulating 16 tons of lead daily. This lead is then placed in earthen towers, filled from the top of the building. The acid (nitric) is then poured on the mess, and passing down collects in tanks, where it is precipitated, then washed, and finally run off into the drying rooms.

The soda room adjoins this portion of the establishment, and in this department the soda used for precipitating the white lead is dissolved and cleaned.

This factory (the first of its kind in the world, the principle on which the white lead is produced having been invented by Mr. Frederick Victor) has been built by an enterprising and sanguine company of five gentlemen who are persuaded that they will succeed in their project, which is nothing less than to produce white lead for the whole Pacific Coast at a cost greatly below that now ruling, for an inferior article in New York. They state they are able to manufacture (with the machinery now in use) from 5 to 7 tons of white lead per diem. If they can do this (and there seems to be little or no doubt of it) their success is an established fact. Anyhow, it is a California production, and as such, born with the New Year, we wish it joy and the compliments of the season. Below are a list of the officers.

President, Otto Kloppenburg; Secretary and Treasurer, C. M. Gerichten; Superintendents, C. C. Rueger and Frederick Victor; Trustees, Otto Kloppenburg, Joseph Fredericks, C. C. Rueger, Frederick Victor and C. M. Gerichten.

Silk at Calistoga.

Mr. R. Bonhomme the lessee of the fine mulberry plantation of Sam. Brannen, Esq., at Calistoga, is making all needful additions, alterations and improvements to the buildings to be used the coming spring for the growing of silkworms. It is the intention of Mr. Bonhomme, to demonstrate the entire practicability of silk growing in that locality as a paying industry, and we believe if any man can do it he will.

We hope, however, as the surest guaranty of success, that he will commence the feeding as early in the spring as it will be possible for him to obtain leaves; for we have no faith in attempting to grow silkworms successfully in the low, hot valleys of the State after the middle of May. In no country in the world is the growing of the silkworm made successful through the entire season, and why it was over conceived that California could be made an exception to the rule, and grow worms in the heat of summer, we never could understand. We wish Mr. B. complete success.

ROSS BROWNE BEFORE THE FARMERS.—Mr. J. Ross Browne will address the Oakland Farming Club, Friday evening, January 10th, on the Agricultural Interest of California, including Irrigation and Swamp land Reclamation. The annual election of officers of the Club also occurs on the same evening. All lectures and meetings are free in this Club.

Leather Market Report.

[Reported for the Press by Bulliver & Co.]

SAN FRANCISCO, Tuesday, Jan. 8, 1873.
Shipments of Sole Leather to the East are quite heavy, and prices are firm, though there has been no advance. Domestic Calf Skin has advanced 10 per cent., in consequence of the large amount destroyed, and French Skins are firm with an upward tendency.

A Splendid Paper.

Messrs. EDITORS.—Your RURAL PRESS is a splendid paper. I am very much pleased with it.

L. S. PRESTON.

PACIFIC MINERAL LAND OFFICE—HOYT, SEARS & McKEE—MERCHANTS' EXCHANGE, CALIFORNIA STREET, SAN FRANCISCO, CAL.—Mining Patents obtained for claims in California, Nevada, Utah, Arizona, and elsewhere. Plans and papers prepared for adverse claimants, as required by the new law, re-locations effected. All claims have lapsed under the Congressional Act of May 10, 1872; Mining Contests conducted before the Departments and Courts.

Mr. McKee's experience as Chief of the Mining Claims Division, General Land Office, Washington, D. C., will be valuable to parties desiring to properly appear either as claimants for patents or as adverse claimants. Claims are attended to in person at any of the District Land Offices, or at the Departments at Washington, where deemed necessary. JAS. T. HOYT, W. H. SEARS, O. H. MCKEE. 1726-3m

WONDERFUL CURE.—A young man, a resident of this city, gives us the facts of the following remarkable cure. He says: "I suffered with Catarrh in its worst form. Bones came from my nose; my breath became offensive; I was compelled to eat alone. I had given up all hopes of being cured. At this time met Dr. Evory, of Chicago, who had been cured by a remedy discovered by himself. I tried the remedy, with little faith; but at the end of three months found myself cured." Our informant has now associated himself with the discoverer in the manufacture of the article, which will be known under the name of the Diamond Catarrh Remedy. Price 50 cts.; sent by mail for 60 cts. A. F. EVORY & CO., No. 9 Post street, San Francisco. Sold by all druggists. 26725-3m

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO., J. R. Roberts, 315 California street, San Francisco. It is recommended by all the best. Send him for circular and information of this reliable, first-class company.

For the very Best Photographs go to BRADLEY & RULOFSKY'S GALLERY, with an "Elevator," 429 Montgomery street, San Francisco. 2674-3m-cowhp

CONTINENTAL LIFE INSURANCE Co., No. 302 Montgomery street, corner of Pine.

The Illustrated Press, SAN FRANCISCO.

A NEW JOURNAL OF FINE ILLUSTRATIONS, Choice Literature, Art and Refined Amusements. Sold by subscription, \$1.50 a year. Samples, 15 cents.

Contents for Jan. 1873.

ILLUSTRATIONS.—The Polar Bear, Pioneer's First View of the Sierras, The Little Col. A. Evans, Will it be "Yes" or "No," Horace B. Cladin, The Attack on Place Vendome, A Christmas Carol, "A Merry Christmas," A the end of the Year, "St. Nicholas on His Travels, An Ice Country Dance, Cape Horn—On the Columbia River, How to make Wax Flowers, Old Dog Tray.

EDITORIALS.—Here We Are—Introductory, California, Letter from President Gilman, The Literary Journal of the Day, Now and Then, "Turned Out to Die," Art Etchings, Studio Notes, Music, The Drama, List of members of S. F. Art Association, Our Young Folks' Corner, Old Fashioned Games, Unlabeled.

POETRY.—Colima, The Lark, A Dream of Home, Christmas on the Street Cars, Alphabet of Short Rules, The Poem on the West, Sir Beulah's children, The Poem.

MISCELLANEOUS.—A Candidate for the Rope, The First American Ship, Conversation in Society, A Legend of the Mohawk Valley, Saved in Mid Air, Miss Pert, I Thought it My Duty, The Science of Leaching, A Beautiful Point in, What is Insanity, What is Dirt, Too Late, Iron and Coal in the U. S., The Origin of Alphabets, The Bell, Getting Married, About Dogs, A Christmas Amusement, Witicism, The Housekeeper, Guess of Thought.

Just issued. Canvassers wanted. Address MURRAY, DEWEY & CO., Publishers, 214 Clay St., S. F. W. H. MURRAY.

Technical Education.

Prof. D. C. Gilman, before the Mechanic Arts College, Mechanics' Institute Hall, S. F.: **Lecture 1. Jan. 4.**—The first lecture of the course to be delivered before the Mechanic Arts College, by the provisions of the State University, was given by Professor D. C. Gilman, President of the University, on Saturday evening last. The subject was "Polytechnic Schools at Home and Abroad." The lecture was opened under the head of "the relation of knowledge to wealth," the speaker stating that the subject to be considered is of vital importance. It involved two questions: "How can we grow wiser?" and "How can we grow richer?" In one of these questions he said we are all interested; in the other we ought to be. In communities wisdom and wealth walk hand in hand. Individuals do not always find this true in their own experience; there may be the exceptions to the rule, but the progress of nations and States is almost always in direct relation to their intelligence and education.

Respecting Education, Great Changes of Opinion Have come about during the last twenty-five years, since the time, we will say, when men who are still fresh and young, the men of forty-five and fifty years of age, completed their schooling. This change requires far more attention than has hitherto been given to theoretical and applied science. The tendency toward the study of mathematical, physical and natural sciences shows itself in all the older colleges, in Cambridge, New Haven, and Princeton and Dartmouth. It has secured from Congress a grant for the establishment of a scientific college in every State of the Union. It has entered the old English universities and modified their traditional courses. It is unexpectedly becoming the entering wedge by which modern ideas are to make their way to Turkey, Syria, India, China and Japan, in every one of which countries modern science, taught by American teachers, is already speaking to those who have hitherto been in darkness. What is this movement, which is so universally recognized as important? It is a recognition of the fact that

A Study of the Laws of Nature, Of the principles by which the universe is shaped and governed; that investigation of the rocks, the stones, the seas, the winds, the climate, the vegetation, the animal life, the human frame, the origin of man, the occult forces of light and heat and magnetism, the laws of motion and force, in all their intricate correlations, is fruitful of good to individuals and to nations.

When this general principle comes to be recognized in the school-room or the college, it is quickly analyzed into subordinate propositions like these: 1st—Everybody should learn something of natural science. 2d—Nobody can learn everything. 3d—In making the selection the practical needs of our circumstances, of our own times and their surroundings, should not be forgotten; in other words, utility or practical advantage should be sought. 4th—We must equally plan for the higher wants of our higher nature; the development of all our intellectual and moral powers, that our infinite as well as finite wants may be supplied; in other words, to practical skill culture must be added.

Coming among you as a stranger, it has given me the greatest pleasure to recognize in California the hearty and healthy acceptance of these principles; and to find that not only in the acts by which the University of California were created, and in the doings of the Regents and the Faculty, but also in the sentiments of the people—educated men and practical men alike—there is a manifest determination to secure for this State a system of education, from the common school to the university, which shall be in harmony with the most enlightened spirit of the age, and which shall thus be worthy of the extraordinary gifts here bestowed by Nature, and of the equally extraordinary opportunities here opened to civilized mankind.

The Whole State of California Needs Scientific Education, Your mines, your agriculture, your manufactures and your transportation cry for schools and colleges in which the young may be trained in those branches of sciences which underlie these modern callings. Elsewhere, and under other auspices, I shall endeavor to uphold the interest of the State in technical education. The point of view to be taken this evening is that of San Francisco. In every community a great city is a miniature State; here are crowded together representatives of callings; here in the school-house where they prepare for life; the market where they sell; the manufactory where they produce; and the refuge to which they flock in poverty and in wealth; here in a compact, accessible mass of busy workers, we may study most of the wants of the State at large.

San Francisco. The lecturer at this point went into a study of San Francisco—its population, its harbor, its commerce, and the occupations of the people, dividing the occupations of the latter into six groups, namely: Agriculture, including market gardeners and nurserymen; Trade, including both wholesale and retail traders, shopkeepers and merchants; Transportation—rail-

road men, horse-car men, expressmen, sailors and carmen; Manufacturers—mining and mechanical; Arts; Personal service—household domestics, unskilled day laborers, barbers, etc.; Professional life—clergymen, lawyers, physicians, journalists and teachers. He then glanced at the statistical information current in regard to those employed in what are designated

The Mechanic Arts. There are, he said, 22,000 persons in this group—how are they employed? Nearly 5,000 (4,917) are men engaged in building and furnishing and repairing the houses in which we dwell, that is to say, are carpenters, masons, painters, plumbers and cabinet-makers. Nearly 4,000 (3,563) are engaged in making the clothes we wear—the tailors, the milliners, the shoemakers and the hatters, pursuits in which the needle and the sewing-machine are controlling forces. Somewhat more than 2,000 (2,012) persons are engaged in preparing food and drink for us to consume—not counting the market men who sell it or the hotel keepers who dispense it, but including bakers, butchers, brewers, fishermen, confectioners and distillers. Almost 2,000 persons, chiefly Chinese, are making up cigars and tobacco for us or for themselves to consume. This accounts for 13,000 of our 22,000. Among the blacksmiths and iron and steel workers we shall find more than 1,500, besides 600 tanners. The miners here resident are more than 1,000. Printers, book-binders and paper mill operatives count nearly 700. Over 400 persons are enrolled as machinists; nearly 400 are operatives in cotton and woolen mills; nearly 400 are ship riggers and carpenters. The remaining 4,500 are distributed in minor groups, too numerous to mention. San Francisco does not differ materially from Boston in respect to the mechanic arts, and although Boston is larger and older, and her wants are more diversified, still the difference in each of the divisions named is slight—the great difference being in mechanical labor and manufacturing interests being exceeded by that city.

Analysis of What is Required Educationally. Now let us sum this up in a few general propositions. It is an acknowledged fact, an axiom of political science, that every nation which would continue in these days to flourish must encourage liberal and systematic instruction in the modern arts and sciences. It is possible in these respects for California to be the equal, if not the superior, of every other American State—because she is free from the overpowering pressure of other traditions and influences, her educational affairs being still in the formative age; because her population is largely made up of intelligent men whose pursuits have made them eager to favor for their boys this sort of training; and because the State within its own territory possesses on an enlarged scale opportunities for fostering the four great branches of modern industry—agriculture, mining, the mechanic arts, and transportation (foreign and domestic). Two distinct wants are to be supplied—the wants of such persons (chiefly mature men) who desire to supplement what knowledge they have already acquired from books, or from life, by more definite, more modern or more advanced instruction in applied science, having reference to technical and industrial callings; the wants of those persons (chiefly young men of the college age) who wish to pursue a long and systematic course of study, with reference to the modern professions (as distinguished from the ancient), and who wish to be thoroughly fitted for the highest duties of scientific men. These two wants are not antagonistic, but are simply different phases of the same social requirement. These two wants are to be met by two distinct efforts. The ordinary

Scientific Classes of the University (Which are its first care), are designed to train up young men to be thorough and well-disciplined experts in the various modern sciences—that they in their turn, may be teachers, advisers and helpers of those who are less favored. This instruction in California must chiefly begin in Oakland or Berkeley. The polytechnic classes, on the other hand, designed for such shorter courses as men already at work desire, may chiefly be taught in San Francisco, during the evenings, in connection with the Mechanics' Institute or otherwise; and in giving this instruction, it will be imperative to supplement the efforts of the scientific faculty of the University with the assistance of other teachers, temporary or permanent. Great advantages (and not those of economy alone) will come from keeping the scientific and polytechnic instructions under one control. The attempt to satisfy these wants in a half-way and incomplete style, will be damaging to industry, science, education and the good name of California. It will be better to wait one year, or five years, until the community can be thoroughly enlightened and aroused as to their own best good, than to go forward at once in a slipshod and haphazard effort. It must be distinctly understood that good

Scientific Instruction Is costly to somebody; like everything else worth having—a good railroad or steamship, a good building or a well-organized city—it takes money. Other callings pay much better than education, and able men of science do not beg for employment. The supply is not equal to the demand. Moreover, the various branches of science require men whose are specialists. An admirable engineer may be a very poor agriculturist; an excellent geologist and mineralogist may be a very poor mining engineer; the accomplished hotanist may be an incompetent adviser in the use of the turbine or steam en-

gine. It is high special attainments which society calls for. These studies are never hostile or prejudicial to literary or classical pursuits; they are simply the additional means of culture which our age possesses. They are not hostile or prejudicial to the everlasting principles of religion, for they are based upon the laws of nature, which are the laws of truth. There is a three-fold application to these principles: The authorities of the University should strive, as they are now doing, to promote both the regular, prolonged and systematic study of science, and also the polytechnic classes which shall give briefer, more practical and more popular instruction, especially in those branches which have a practical bearing upon the pursuits of California.

The Public Must Provide the Means Of giving this instruction on a scale worthy of the names of the Golden State and the Golden Gate. The State must increase its allowance or the city must be encouraged to help this branch of the school system; or far better yet, those who have been prospered in the acquisition of wealth must endow the chairs and provide the apparatus and the materials by which this instruction can be given. The young men of California must prepare themselves for and must enter upon these modern scientific pursuits, if they would guide the future industries of this State and build it up in wealth and prosperity. Their own enjoyment in life, their daily comfort, and their appreciation of all that is good will be thus quickened; and so also the influence of California, throughout the nation and the world, will be honorably and permanently augmented.

Mining and Other Companies.

Outing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Amazon Silver Mining Company—Location of works, Ely District, Lincoln County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the Twenty-second day of October, 1872, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary of the Company, at his office, No. 609 Sacramento street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the sixth day of January, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 22d day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. J. McMANUS, Secretary pro tem.
Office, 609 Sacramento street, San Francisco, Cal.

Amazon Silver Mining Company—POSTPONEMENT. The day for assessing stock delinquent on the above Assessment is hereby postponed until Thursday, the 22d of January, 1873, and those thereof until Friday, the fourteenth day of February, 1873. By order of the Board of Trustees. J. H. McMANUS, Secretary pro tem.

Cordillera Gold and Silver Mining Company—Location of property, Morelos Mining District, Chihuahua, Mexico. At a meeting of the Board of Trustees held at the office of the Company, December 21st, 1872, a special assessment of fifteen cents (15 cts.), was levied on each and every share of the capital stock of the Company, payable immediately in coin, to the Secretary of the Company, No. 321 Washington street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, the 21st day of January, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 14th day of February, 1873, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

W. F. REED, Secretary.
Office, 321 Washington street, San Francisco, Cal. December 25th, 1872.

Gold Run Mining Company—Location of works, Nevada County, Cal. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of December, 1872, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, corner of Market and Spear streets, San Francisco. Any stock upon which said assessment shall remain unpaid on Tuesday, February 4th, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, February 25th, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. C. PALMER, Secretary.
Office, corner Market and Spear streets, S. F. Jan 1st

A Special Meeting of the Stockholders of the Gold Run Mining Co., for the election of a new Board of Trustees, and for the transaction of such other business as may properly come before the meeting, will be held at the office of the Secretary, corner of Market and Spear streets, on Tuesday, February 4th, at 12 o'clock M. By order of Board of Trustees.

C. C. PALMER, Secretary.

Great Blue Gravel Range Company—Location of works, Blue Gravel Range, Placer County, California. PACIFIC BRIDGE COMPANY.

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

Sketch of Delaney's New Patent Cushion.

DESCRIPTION OF ENGRAVING.

E, pin or regulator, extending into rail; D, steel wire,
tending from pin into and through rubber cushion; B, rub-
ber cushion; C, is end of rubber cushion; A, lining.
Their construction is of the simplest kind, thus making
no heavy expense for apparatus or labor. The im-
provement is a steel wire running lengthwise, and commu-
nicating with a pin at each end and inside of the rail;
the wire is imbedded in the rubber cushion, near its edge or
surface. The pin mentioned is controlled and operated
upon by a key, regulating the tension of the wire, accord-
ing to the necessities of the case. It keeps the edge of the
cushion straight and sharp. It prevents the rubber hard-
ening from the impingement of the ball; and, above all
other considerations, the angles are bound to be perfectly
correct.

The ball never jumps from the table, however severe the
stroke. It makes no noise when leaving the cushion.
Nine cushions are made upon our tables with the same
degree of force requisite to make six up a any other.

These unrivalled cushions are self-protective, and will re-
tain their elasticity either in hot, cold, dry, or damp weather,
almost forever.

Thousands of Delaney's cushions have been introduced
throughout California and the Great West, where the
largest billiard manufacturers now make exclusive use of
them, to the eminent satisfaction of their patrons.

Sole Agents for the Pacific States, China, Japan, Sand-
wich Islands, and Australia.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for this superiority of our
products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive
now in use, and the lifting force of the best blasting
powder, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.

From the Mining Summary in the Gold Hill News of December 28th.

The New Root Boiler

IS A PERFECT SUCCESS.

The saving in the amount of fuel consumed, alone amounting to 30 per cent. less than the cost of running the same machinery with the old style of Boilers. For price list and prompt execution of orders please address

GIANT POWDER

Circular.

GIANT POWDER has been in practical use on this coast about four years. The demand for it has increased to such an extent that it bids fair to become throughout the United States of America the universal Blasting Powder, if the enormous consumption in Europe, where it has superseded black powder nearly altogether, may be taken as a true criterion.

Since Mr. Nobel introduced his famous Dynamit, or Giant Powder, a number of different blasting materials have been brought to light; but in Europe all of these, without exception, have soon been thrown aside, not having the two great requisites combined—great power and perfect safety. It is an indisputable fact, that the mixing of two or more explosive substances, as, for instance, nitro-glycerine and black powder, increases the danger of either, if of the former enough he added to produce a powder of great strength.

Transportation of Dynamit (Giant Powder.)

For the sake of public safety, Railroad Companies in Europe have examined into the nature of these various blasting powders, and come to the conclusion to prohibit the transportation of all, with the exception of Dynamit, or Giant Powder. This powder having been pronounced perfectly safe, is now the only one allowed on railroads. As a proof, we copy the decree issued by the Austrian Government.

Decree of the Imperial Ministry of Commerce, Vienna, October 30th, 1869.

(Z. 21,371—3,767.)

To all Managers of the Railroads under this Department, relating to free Transportation of Dynamit on Railroads:

Late experiments having dispelled the fears of the Ministry of Commerce as to the explosiveness of Dynamit, which induced them to exclude this article from transportation on railroads and stages; and having conclusively proved that Dynamit (Giant Powder) is far safer than any other blasting material.

Now, therefore, the Ministry of Commerce has resolved to withdraw the decree of December 15th, 1868, (Z. 15,956) prohibiting the transportation of this blasting material known under the name of Dynamit (Giant Powder), and to allow such transportation under the following Rules and Regulations:

According to a communication to the Ministry of Finance, dangerous blasting materials, such as Dualin (a mixture of Nitro-Glycerine and Pyroxilin—i. e., Nitrate of Cellulose.) 2d. Lithofruteur (Hercules Powder, a mixture of Nitro Glycerine and black powder), have been imported into Austria under the false name of Dynamit, (a mixture of Nitro-Glycerine and non-explosives, for instance, silicate,) or as Nitrate of Salt.

The importation of dangerous blasting materials, under false names, being strictly prohibited, and Messrs. A. Nobel & Co. being the only firm entitled to make or vend Dynamit (Giant Powder) in Austria, therefore—

The Imperial Ministry, by a decree dated March 9th, 1870, calls the attention of its sub-departments at Prague, Lemberg, Innsbruck, Troppan, Linz, and Salzburg, to the fact that the above factory will attach their firm name to every package of Dynamit (Giant Powder), and that all shipments to Austria have to go through the Custom House at Zittau until further notice.

General Properties.

Giant Powder is an ungrained Powder, of a grayish brown color, with a specific gravity of about 1.

It is insoluble in water, and is not affected by time, or exposure to air or moisture.

It congeals at about forty-two degrees Fah. In the open air, or in ordinary packing, it burns without exploding.

Its combustion produces carbonic acid, oxide of carbon, hyponitrous acid and water.

Unlike gunpowder its explosion is instantaneous. The entire mass of Powder explodes as if it were a single grain. This quality, in connection with its extraordinary evolution of gases,

causes its explosive effect to be especially great in solid substances.

Its explosion produces carbonic acid, nitrogen, oxygen and water.

We beg leave to say to all those who have not yet tried or adopted the use of Giant Powder, that since its introduction in Europe, the consumption has increased so largely that the inventor and owners of this justly celebrated powder have been obliged to increase the number of their manufacturing to six or seven, which produce hardly sufficient powder to supply the ever-increasing demand. Two factories are in the north of Germany, one in Austria, one in the south of Germany, one in Italy, one in Scotland, etc. This, we believe, is the best proof we can lay before our friends of the great superiority of Giant Powder over every other explosive. This will show that it has been successfully introduced in ALL the different countries in Europe, and the increasing demand for the Giant Powder on this coast and in the Eastern States, where the company have erected extensive works, will soon make it the universal blasting powder throughout the world.

Since about two years a second grade Giant Powder, called No. 2, which is sold at one-half the price of the stronger grade, or No. 1, has been placed by the company on the market, and this also has been so favorably received by those engaged in blasting, that it is now largely used in medium and sandy rock, lime, marble, pipe-clay, and in coal, sulphur, cement, and gravel bank mines. Herein it stands as unrivalled as the stronger grade, or No. 1 Giant Powder, does in hard rock, iron, copper and submarine blasting. Its application is precisely the same as that of the stronger grade, and it is fully as safe.

In the United States the railroad companies are taking the matter in their own hands, and refuse transportation to all compounds condemned in Europe as dangerous, but transport Giant Powder.

Charging the Bore-holes.

You must bear in mind that to have satisfactory blasts it is essential that the charge is properly put in, and everything depends upon this. There is only one way, and this must be implicitly carried out, and never must any deviation be made from it.

Cartridges must be cut into 3 or 4 pieces, and each piece must be well rammed down with a wooden ramrod, so as to reach the bottom, and to be laterally spread out in the bore-hole; in order to do this thoroughly, we strongly recommend to cut the paper of each piece of cartridge lengthwise 3 or 4 times; in this way the powder can be easily spread in the bore-hole and the whole charge will form one solid mass. If this mode of charging a hole is scrupulously carried out, a satisfactory result may be relied upon. The instantaneous explosion of Giant Powder requires it to be solid in the hole and not surrounded by air, the elasticity of which would act as a cushion and weaken the effect of the powder. But when a whole cartridge is merely pushed down the bore-hole, no matter how closely it may fit in the same, experience has taught us that only a partial success can be gained. This most important procedure is often neglected, and we therefore cannot urge it too strongly on those who use this powder never to deviate from our directions herein laid down. When the Giant Powder is used in bulk or loose, only small quantities at a time must be rammed down the bore-hole to form one solid mass. To prevent the powder from adhering to the wall of the drill-hole, a tin tube with a funnel to it should be used, through which the powder is rammed down. It is maintained, with perfect truth, that Giant Powder, unlike black powder, breaks the rock below the bottom of the bore-hole, as well as at the sides. But to do this effectually, it must be brought in contact, not only with the walls of the bore-hole, but also with the bottom.

Firing the Charge.

The modes of exploding the charge are various. After the cap is put on the end of the fuse, and with a pair of nippers pressed firmly around the edge into the fuse, some grease or wax should be rubbed around the upper end of the cap to make the same air and water-tight. Now insert the fuse into the bore-hole until the cap rests on the charge; then take a small piece of a cartridge, about three-quarters of an inch, push it down with the ramrod and press it around the cap so that the latter is inserted in the powder to about half its whole length, but

never deeper, because if part of the fuse were in the powder, it would ignite the latter, and all the powder above the cap would be burnt up without exploding. Another way of exploding the powder is to cut off about an inch in length of a cartridge, smaller in dimension than the bore-hole, press into this piece of so-called priming cartridge the cap, after it is well fastened to the fuse, and with a string tie both together to prevent the cap from being withdrawn, then let this priming cartridge down the bore-hole until it rests on the charge, and fire the fuse. The object is to get the cap in some way into the charge of powder in the bore-hole. We believe tamping would be beneficial, especially in the use of No. 2 Giant Powder; but a tamping done merely with the ramrod is quite sufficient. The stronger grade Giant Powder frequently does not require any tamping, but whenever water tamping can be used, as for instance in all downward holes, it should be applied. It excludes every particle of air, and forms a solid column on the charge. This is an advantage which only Giant Powder possesses. Bear in mind this fact, the better the explosion of the cap by being tight on the fuse, the more complete is the explosion of the whole charge.

We advise all those who adopt the use of Giant Powder, to commence with large charges, and as they become more acquainted with its action to reduce the quantity at each blast, until the minimum quantity required to do the work is determined. In some kinds of rock a heavy charge is not as effective as a smaller one, but those who use this powder can best determine this themselves.

In some mines where this powder has been in successful use from the beginning, and where the monthly consumption is from 500 to 1,000 pounds, the amount for each charge has been reduced to about one and one-sixteenth ounces to each foot of hole drilled, the holes being one inch in diameter, made single-handed with three-quarter inch octagon steel and a four-pound hammer.

It is well known that black powder has but a limited power, and for this reason the bore-holes have to be so large as to require two men, and sometimes three, to drill each one. In Giant Powder you have an explosive from ten to twenty times stronger than black powder. Why then insist any longer on a large hole when a smaller hole, made with a light hammer by one man, and charged with Giant Powder, will do a much greater execution? Giant Powder explodes about twelve times quicker than ordinary powder; for this reason it works not only laterally in every direction, but also much below the bottom of the hole. As Giant Powder requires about one-half the number of men that black powder does, it meets, on account of this labor-saving quality, many enemies, especially in a country like this, where mine owners cannot always engage new men when the old refuse to adopt the new system of single hand-drilling.

That Giant Powder is superior to all other explosives, is even acknowledged by its most vehement opposers, from the simple fact that in wet ground those who still cling to the old powder use the Giant, the black powder being too troublesome, and of too little effect. For the same reason, besides others, all other lately invented explosives have been abandoned—Giant Powder stands alone as the explosive which can be used with the same facility in wet or dry ground, or under water.

If, therefore, Giant Powder is much superior in wet ground, it must be the same in dry, and only prejudice and ignorance are its enemies. If these can be overcome we can confidently leave its merits in the hands of those who have blasting work to perform.

Giant Powder is no exception to other labor-saving inventions—it has to pass through a certain ordeal, and then its full triumph will be universally acknowledged; then those who now oppose it will become its firmest friends, because they will perceive that it creates a demand for more labor, on account of its labor-saving qualities. This saving amounts to fully from 40 to 50 per cent. in all cases where this powder is exclusively used. Moreover, the hundred-fold greater safety of Giant Powder compared with black powder, as well as gun cotton and other explosives which appeared in Europe, but never came into practical use, will be fully appreciated, especially by those who handle it.

Nobody denies the enormous power which is possessed by Giant Powder. It therefore becomes the duty of every person using it to study its action and effect, and to select the proper places for bore-holes accordingly. It often requires differently located drill-holes from those for black powder, and for this reason even the most experienced black powder blaster must again study and learn, as he had to do with the ordinary powder, the correct application of this before he can expect to derive the fullest benefit. For instance, in tunnel work a horizontal hole in the middle of the face of the tunnel, in depth half its diameter, and charged with a heavy charge of Giant Powder, will clear a cone and expedite the work materially. Such hole should be at least 1½ inches in diameter.

In sinking shafts, stopping and drifting, full face single-hand drilling, as before described, should be introduced by all means. We cannot lay down positive rules for Giant Powder, nor are there such for black powder.

Temperature.

Consumers frequently forget that Giant Powder becomes hard by even moderate cold, and

when used in that condition, and the charges do not explode, the powder is blamed, while in reality the workmen are at fault. They should bear in mind the fact that below 42° Fahrenheit it congeals, and above 212° (the boiling point of water) it throws off noxious fumes. It should, therefore, be kept in some place having a temperature between these extremes. When frozen it can be easily thawed by being kept for a time in any warm place, and when it again becomes soft it is as good as before. As fire does not explode, but merely burns it, it can be kept without any danger in a house. We again repeat, never attempt to explode Giant Powder when it is hard, for you will not succeed.

Giant Powder in its Various Applications.

Giant Powder has proved as effectual and labor-saving to submarine blasting as in mines, and for railroad work. The procedure is indeed very simple. If submerged rocks are to be removed, all that is required is to take a box of Giant Powder in bulk, bore with a gimlet a hole in the box, fasten the cap well to the fuse and push the same through the hole, its length into the powder—never further—tighten the hole with wax or grease, light the fuse (which only requires sufficient length to allow the box time to reach the rock when sunk), and drop the same on the rocks to be removed. In this way the entrance to the San Francisco Dry Dock has been cleared of rocks, under the superintendence of the late efficient Engineer, Mr. Pollock. As much as 100 pounds, and even more, of black powder were lowered on those rocks and exploded, but nothing was effected except throwing up a handsome column of water. Then Giant Powder was tried, and a box of ten pounds lowered. This small quantity shattered the rock, which had withstood the ordinary powder repeatedly. Six-pound boxes were then used. These had still such enormous effect that injury to the masonry work was feared, and three-pound boxes were ordered, which in a short time successfully removed all the rocks impeding the entrance of vessels to the dry dock.

IN SULPHUR BANKS, where the black powder cannot be used, its slow explosion firing the sulphur, Giant Powder works with great success, its quick explosion preventing the ignition of the sulphur, as affidavits will show.

IN WOOD it generally works with great success. We will give the results arrived at in felling trees:

In an oak tree of from 19 to 20 inches in diameter, a horizontal hole was bored 10 inches deep and 1 inch diameter; this was charged with one-third of a pound of Giant Powder, and tamped with earth. The result was, that on the side where the hole was bored a cone was torn out nine inches deep and eight inches in diameter. The sides of the cone were crushed, and on the opposite side the tree had large cracks. If a second hole had been bored on this side about twelve to fourteen inches deep and two feet below the first hole, and charged with an equal amount of Giant Powder, the tree would have come down.

BLASTING STUMPS.—In the middle of a stump three feet in diameter, and only a few inches above the ground, a hole was bored 14 inches deep and 1 inch in diameter, charged with Giant Powder and tamped with earth. The result was, the stump was torn and rent so much that, with the assistance of a few gads, it was easily removed. On account of the toughness of the wood, a tamping is necessary, which could safely be done by a plug, through which lengthway a gimlet-hole is bored for the introduction of the cap with fuse attached.

Sinking Shafts and Wells.

Although we advise the introduction of single-hand drilling, being the means of great saving in expenses, we shall state the experience gained from parties who have successfully sunk wells and shafts by central blasts made with heavy charges of Giant Powder, proving a saving of more than 50 per cent. over the use of black powder.

In the center of the shaft or well a hole should be drilled from 50 to 70 inches deep, according to the hardness of the rock, and from 1½ to 2 inches in diameter, and charged with about 1 to 1½ pounds of Giant Powder.

The effect of such a blast will be an extraordinary one. The rock from the mouth of the bore-hole is torn like rags, and completely crushed, and can easily be taken out by hand labor. After the loose rock is removed, a few small blasts, with from ¼ to 1½ ounces Giant Powder will square the bottom again. One pound of Giant Powder breaks on an average from 130,000 to 150,000 pounds of rock.

Packing, Storage and Transportation.

The Powder may be packed, stored and conveyed in all the ordinary ways.

The fact that the Powder is explosive, naturally suggests the idea that it is dangerous; but it is in reality no more so than corn meal. Practically, it cannot be exploded by accident. It requires design and careful preparation to explode it. The only practical caution necessary is to keep other explosives away from it.

To remove all timidity, we will here state more fully the peculiar conditions for explosion.

Fire alone will not explode it, nor heat in any form—they will burn it to ashes, without exploding it.

Nor will any amount of mere weight upon it, or simple pressure of any kind, explode it. It cannot be exploded by any of the ordinary

movements, accidents, or incidents which attend its handling, transportation, or use.

The pressing it into cartridges, or ramming it into bore-holes with a wooden rod, however, hard, throwing it about, or jostling it in transportation, wagons, collisions of cars, or explosions of boilers, will never explode it.

But heat and pressure combined will explode it, provided they are of the proper kind and degree.

It is exploded by any violent explosion either in it or into it, whether of fulminate, nitroglycerine, Giant Powder, or other violent explosive. Such an explosion involves the peculiar percussive pressure and heat necessary. The burning or flashing of gunpowder unconfined is not sufficient.

Another method of exploding it is to set it on fire while under confinement in some tight and strong vessel.

The burning of the Powder produces gases which, finding no escape, at length cause a pressure so great as to produce, with the heat of the burning, an explosion of the unburned Powder.

By tight and strong vessels is meant iron retorts, quicksilver flasks, gas pipe, with caps screwed to its ends, and the like.

A vessel of the strongest tin has not the requisite strength; it, like cartridges of paper, ordinary packing boxes, barrels, casks, etc., will be burst asunder by the gases before the pressure is sufficient to cause explosion.

Important to Miners.

The Grass Valley Union of Nov. 20, 1872, states the following facts in regard to Giant Powder and single-hand drilling:

Good and honest skilled miners have been in demand, all over the State, for the last six months. The supply has not been equal to the demand. One mine in this county has advertised for men at advanced wages. We mean the North Bloomfield mine. The mine offering the advanced wages wants men who work single hand drills and with Giant Powder. It appears that single hand drills and the Giant do not knock down wages. The said drills and the said powder do not make the demand for miners any the less. On the other hand, more men are wanted now than ever before in the history of this part of the country, and better wages are offered. The usual effect of all improvements follows here, as it has always followed improvements everywhere and in every age of the world. Improvements in machinery or in material do lighten the burdens of labor and pay the laborer better for his light labor than he was paid when he had to toil the harder. The miners ought to begin to see that improved agents for production make a greater and a better demand for labor.

In Pipe-Clay Banks it is Invaluable.

A hole six inches in diameter, bored with an auger any desired depth into the face of the bank, and firmly charged with GIANT POWDER No. 2, will shatter the bank so thoroughly that no large lumps are thrown out, and again the expense of reducing these is saved.

Safety of Giant Powder in Transportation.

As neither fire nor any shock it may receive can explode it, it is as safe to carry as unexplosive merchandise. We never had any difficulty in shipping it on steamers, sailing vessels, railroads, teams, etc. Thousands of cases have been forwarded to the interior, to Nevada, Oregon, Utah, Colorado, Montana, Honolulu, Japan, Mexico and Peru, but never has a single accident happened. During nearly four years that this powder has been in market, and with the millions of blasts which have been made with it, judging from the amount of caps we have sold, we have heard of not one accident where the fault lay with the powder. Premature explosions, resulting from the powder being rammed down into the bore-holes, have never taken place. Practically, nothing but the Giant Powder Cap can explode it. It is so safe that charges of black powder placed on top of the Giant Powder in bore-holes, have never yet exploded the latter.

General Remarks.

From the resume given in the foregoing, it has been shown that Giant Powder has the following advantages over black powder:

A great economy in labor for boring.

Perfect safety in carrying, storing and handling it.

The quickness of explosion is so great that fissured rocks and clay are easily blasted with it.

Great saving in wear and tear of tools and in consumption of steel and fuse, fewer bore-holes being required.

In most cases no tamping, except with water or loose sand, is necessary. The loading is attended with no risk, but with a great saving of time.

In shouder blasting it is very superior, as a small charge of Giant Powder in a hole made with a half-inch drill will shatter the same to small fragments.

It offers an absolute security against explosions from fire, and is entirely insensible to shocks, falls and knocks, as they happen in transportation.

The gases are not injurious, and permit of much quicker work underground.

In the working of mines, quarries, open cuts, etc., it is so much superior that it must, in almost all cases, take the place of black powder.

The saving in expenses are from 30 to 60 per cent. in favor of Giant Powder, the gain in time

from 40 to 70 per cent. This last advantage in many cases is of incalculable value.

In the opening of quartz and coal mines, in running long tunnels and sinking shafts through barren rock, the saving in time must naturally be of great importance, in reaching so much quicker the fortunes to be unearthed.

For submarine blasting and wet ground work, Giant Powder has become indispensable.

It has proved of great importance and enormous advantage in warfare, removing palisades, blowing up of bridges, etc., and for many other purposes. Lastly, in many cases, where black powder is of no avail, Giant Powder will prove very effective.

Considering all these advantages, which Giant Powder possesses, we are well warranted in asserting that the speedy introduction of Giant Powder for the whole civil and military technic is much to be desired.

A fair trial never fails to prove a complete success. The first blasts are conclusive as to its enormous power, but its full economical value can only appear when experience is gained and no waste of powder is allowed.

We give below the opinion of the press, a number of testimonials from private parties, and the results of some interesting experiments made some three years ago by order of the Austrian government with Giant Powder, or Dynamit (as it is called in Europe), gun cotton, and black powder, and shall add only a few more words about the relation of Giant Powder to gun cotton, including in regard to the latter, the improvements made in England in the same.

The strength of gun cotton of equal volume with Giant Powder is, notwithstanding the great compression, very much inferior to that of Giant Powder.

In equal holes it is impossible to introduce the same power of Giant Powder and gun cotton. Giant Powder will always have the advantage of from 30 to 40 per cent. It follows, therefore, that the expenses of boring the holes for gun cotton must be much greater, the gain of time in blasting much smaller, than with Giant Powder. It is not likely that this proportion can ever be materially changed, as it is conditional on the aggregate proportion of nitro glycerine and the cotton fibre.

Gun cotton has the same disadvantages for submarine blastings as black powder, or any explosive mixed with black powder.

We respectfully subscribe ourselves your obedient servants.

NO. 2. GIANT POWDER.

A combination of Giant Powder and other substances, producing a large volume of gases when mixed and exploded, has proved it, in practical use, of so great merit that the sales of this compound are continually increasing, it being well adapted for medium hard rock, bank-blasting, coal mines, etc.

In its explosion it is slower than the regular Giant Powder, but for this reason it tears the rock more and reaches further.

This powder is as safe in every respect as the other, and nearly as strong.

It sometimes gets hard in the cartridges, when exposed to extreme heat, but this does neither injure nor weaken it. When hard, it can be very easily pulverized or softened again, by rolling the cartridge a few times with the foot, or striking it a few sharp blows with a stick. There is no danger whatever in doing this.

The Giant Powder is so safe, that without the Giant Powder Caps it is almost impossible to explode it.

Use only OUR GIANT POWDER CAPS; others are not reliable.

This grade of Giant Powder is used in the same manner as the No. 1, with the single exception (that greater care should be used in charging wet holes, the No. 2 being more susceptible to the effects of water); however if in wet holes a primer of No. 1 is used, it insures, beyond all question, the efficacy of the blast.

The strength, in both grades of Giant Powder, can never be destroyed by any atmospheric influence, and if treated as before described, it always recovers its full power. This is another advantage it has over all other explosive powders.

In bank blasting, the great crushing power of No. 2. Giant Powder renders it far superior to all others. It not only throws, but completely pulverizes the bank, rendering washing much more easy, and preventing any gold from being carried over the dump in unbroken lumps of cement or gravel.

Interesting Trials, Showing the Relative Strength of Giant Powder, Gun Cotton and Black Powder.

The most interesting and especially important trials for the Military Engineer with Giant Powder against wooden objects are those conducted by the Military Engineer Corps of the Royal Prussian Garde Pioneer Battalion against palisades. The results of these trials are taken from a certified copy of the official protocol, and comparisons of the effect of Gun Cotton in blasting, having also taken place in Vienna, conducted by the Military Corps of Engineers, returned from Schleswig-Holstein:

A.—Blasting of obstruction; palisades being twelve inches diameter; round posts, eleven feet long, three feet in the ground, and three inches apart.

1. GIANT POWDER.—FIVE pounds placed in a single bag, hung two inches above the ground.

RESULT.—Three palisades broken off close over the ground, and an opening produced of three feet eleven inches in width.

2. BLACK POWDER.—FIFTY pounds in a box, placed at the foot of the palisades.

RESULT.—Two palisades broken, one close to the ground, and the other one and one-half feet above the ground, and two palisades pushed somewhat to the side; width of opening produced, three feet two inches.

3. GUN COTTON.—A barrel with TWENTY-FIVE pounds placed against the palisades; firing by electricity.

RESULT.—Four palisades broken close to the ground; of the next two some splinters broken off; opening produced, three feet and seven inches. Hereby must be remarked that these last palisades were placed close together, with an earth-bank thrown up against the same on the other side, a circumstance favorable to the result.

B.—Blasting of a double row of palisades close together with an earth-wall thrown up against the same. Palisades pointed, twelve inches in diameter, eleven feet long, three feet in the ground; second row, or breast palisades, from six to eight inches thick.

1. GIANT POWDER.—SEVEN pounds, packed as before, simply in a bag.

RESULT.—One breast palisade broken off three and a half feet above the ground, two pointed palisades broken off two feet above the ground. Of a third pointed palisade there remained but a small piece standing; opening produced, three feet.

2. BLACK POWDER.—SEVENTY pounds in a strong box placed against the palisades on the ground.

RESULT.—One pointed palisade broken off two feet, and one breast palisade two and one-half feet above the ground, two palisades pushed to the side. The opening made was not passable, the palisade burning faintly.

3. GUN COTTON.—Pointed palisades, twelve inches diameter, twelve feet long, and three feet in the ground; breast palisades from five to six inches diameter. For blasting were taken two barrels, each containing TWENTY-FIVE pounds gun cotton, placed fifteen feet distant from each other, and separated by a two feet high earth wall; simultaneous ignition by electricity.

RESULT.—Each barrel tore away three pointed palisades behind them, which produced one opening of four feet and one of four feet six inches.

The result of these six trials is:

First.—The effect of FIVE pounds of Giant Powder, by single obstruction palisades, placed loose in single bag, is equivalent to FIVE TIMES the weight of gun cotton, and TEN TIMES the weight of black powder, provided the two latter materials are put in cases with a strong resistance.

Second.—Against defective palisade works SEVEN POUNDS of Giant Powder, in a loose inclosure (a bag) have a much stronger effect than TEN TIMES the quantity of black powder in weight enclosed in strong boxes, but a little less effect than TWENTY-FIVE POUNDS gun cotton in a package with strong resisting powers.

C.—A changed trial of the above described Prussian defensive palisade works.

The enormous but comparatively local effect on the Giant Powder proved in the former trials that a much more favorable result would be obtained by a more proper distribution of the Giant Powder to the nature of the object to be operated upon. For this reason the following trial was made:

A common gas pipe, twelve feet in length and one and a half inches in diameter, was filled with EIGHT AND A HALF POUNDS of GIANT POWDER, soldered at one end and closed with a common cork at the other. This gas pipe was hung against the palisades horizontally, two and a half feet above the ground.

The Giant Powder was exploded by a cap and fuse. The explosion was an instantaneous one, notwithstanding the considerable length it was distributed, and fired only at one end.

RESULT.—Three palisades, with the breast palisade behind them, broken off at one and a half feet above the ground; of a fourth, only a small part remained standing; three others fell over as soon as touched, and two more broke off and fell to the ground on being pushed. One breast palisade broke off one and a half feet above the ground. There remained standing in the length of twelve feet only three palisades and three breast palisades.

This trial is very convincing proof what enormous results can be arrived at when the Giant Powder is properly applied. If ten pounds had been used, very likely the whole length of twelve feet palisades would have been knocked down.

Very characteristic of the fearful effect of the Giant Powder was the circumstance that the gas pipe was broken into numerous very small pieces, and which had such enormous velocity that they penetrated the palisades like shot.

In regard to the former trials and those made afterward, a strong inclosure, in which the Giant Powder was placed, was hardly necessary. The Giant Powder distributed in a canvas hose would have been sufficient.

The probability to do away with the necessity of confining the Giant Powder in strong vessels, is of very great importance in using it for

military purposes. In this way useless weight is not alone saved, but the danger avoided to the friendly troops being wounded by flying pieces.

This danger was especially a very great obstacle in the Austrian army, from using the barrels made of Bessemer steel.

BANDMANN, NIELSEN & CO.,

Of the Giant Powder Company.

Experiments made at the Company's Works, Showing the Relative Strength of the Two Grades Giant Powder and Black Powder.

[From the S. F. Mining and Scientific Press.]

The Giant Powder Company, of this city, instituted recently several very interesting experiments at their works (on the Treat Tract on the Central Road) at which a number of prominent citizens, gentlemen interested in mining, and members of the press were present. The object was to show clearly that the article they manufacture is greatly superior and absolutely much cheaper for blasting and like purposes than common powder, and that its use is unattended with danger when ordinary care is exercised.

To prove the first point, comparative tests were made of the force of each article in projecting shot from a mortar. The mortar was elevated 45 degrees, and a 32-pound cylindrical shot was fired by charges of blasting powder and of Giant Powder. Of this last the Company manufacture two kinds: "No. 1," the ordinary kind, according to Nobel's patent, and "No. 2," a weaker compound (whose ingredients are not given), the property of the company, much cheaper than No. 1, and intended for use in certain kinds of rock where an excess of powder is not required. No. 1 costs \$1 per pound, and No. 2, fifty cents.

In these experiments the charges were 8 grammes of each powder. The blasting powder threw the ball 17½ feet (mean of two experiments); No. 2 Giant Powder 410 feet, and No. 1 Giant Powder, 545 feet.

Next, the shot (now a 32-pound ball) was thrown vertically in the air from a mortar, whose bore was of sufficient dimensions and shape to hold only the lower half of the shot, around which a loose packing of sand was poured. The charges were now 30 grammes—about one ounce. The blasting powder merely blew out the packing; No. 2 threw the ball about 486 feet, and No. 1 about 788 feet up in the air. The time was taken by several gentlemen. The No. 1 charge also burst the band around the mortar.

The horizontal fire gave, as the comparative projecting force of the mixtures, the proportion of 1 to 23½ to 30½. From the vertical fire we can make no proportion, as the common powder did not even lift the ball out of the mortar. The distances to which the ball was thrown by No. 1 and No. 2 were as 1 to 1.6. These experiments show how much more powerful is the Giant Powder, and hence that, other things being equal, from the much greater work done, it must be a more economical agent. It seems to us that it must come into very extensive use, if the matter of attendant danger can be settled satisfactorily. The next experiment was to show that the powder cannot be exploded by fire, and that ordinary care will obviate all danger. The company claim that, in all accidents known to them, the cause has always been simply carelessness, and never attributable to the powder.

A five-pound box of the Giant Powder, out of which about half a pound had been taken and exploded by fuse on a log, which it shivered to splinters (this being done merely to satisfy all that the contents of the box actually was Giant Powder), was closed up, as when prepared for transportation, and placed in a fire of brush and twigs. When the box had been burned through, the powder caught fire and burned, like fire in pyrotechnic displays, without explosion. This proved conclusively that simple heat will not explode the mixture.

With the properties of nitro-glycerine no one is yet fully acquainted. Yet the composure with which the officers of the company stirred up the fire in the last experiment showed that they had not the slightest fear of danger from burning the Giant Powder (which they would perhaps term nitro-glycerine rendered harmless), and the result justified their confidence. In regard to accidents at factories, Mr. Bandmann said that the majority occurred by a desire to economize by saving the sulphuric acid, which, after being used, is washed out from the manufactured nitro-glycerine. This is very apt to retain some of the nitro-glycerine, and hence the accidents. On this account, this company does not use further the acid which has been once employed. The nitro-glycerine once mixed with the other ingredients to form Giant Powder, no further danger is feared. A proper degree of caution, however, is never superfluous.

Bank Blasts with No 2 Giant Powder.

On the 22d May, 1872, 2,500 pounds No. 2 Giant Powder were placed in the cemented gravel bank on the Dutch Flat Water Company's ground at Dutch Flat, Placer County, owned by Bradley & Gardner. This blast was calculated for 400 kegs of black powder. Result: More ground was moved and shattered than 1,000 kegs of black powder could have done.

The Second Great Bank Blast.

Took place on the 26th June, 1872, at Gold Run, in Messrs. Taylor & Harriman's claim. Result: A brilliant success; 3,500 pounds of No. 2 Giant Powder were used, and swept out the bottom and threw and broke the bank back of the claim line. Amount of bank broken and thrown, 200,000 cubic yards.

Giant Powder at the Sandwich Islands.

In Honolulu harbor a large rock had to be removed from the boat landing of the Kohala Plantation, which common powder failed to remove. We insert a letter received from there, which speaks for itself:

HONOLULU, March 31, 1869.

I have tried two or three blasts with the Giant Powder upon the rock at Kohala Plantation Landing, with wonderful success. It is a very powerful agent, and we shall soon have the whole rock removed.

In practice, particularly under water, it is a hundred fold better than common powder.]

Respectfully,

(Signed), SAMUEL N. CASTLE,
For Kohala Sugar Co.

We will state that in blasting under water, the cartridges as they are used in mines, can be taken, a cap with fuse attached inserted in the powder, a little weight attached to the same and laid on the rock. Such a cartridge with Giant Powder, can lay for hours under water, and remain effective, as the water does not injure the powder.

The bottom of the Stockton channel, consisting of hard and tough pipe-clay, covered with some feet of mud, was ordered to be deepened. Holes were bored into the clay, and with a great deal of trouble black powder introduced, but it had little or no effect, it being too weak for this purpose, and could not break the tough pipe-clay or cement. Giant Powder was then ordered, and the manner in which it was applied is as follows: After the dredging machine had scraped off the mud, a hole of about three feet in depth was bored with an auger into the pipe-clay, and a tin tube put down into the bore-hole, a common paper cartridge of Giant Powder pushed through the tube to the bottom of the hole, then a priming cartridge, with a cap and fuse inserted, until it rested on the charge. The tube was then withdrawn and the fuse ignited. Each blast did its work effectually. In this way the channel was soon lowered to its required depth. The clay, which was all crumbled and broken into small pieces, was afterwards removed by the dredging machine.

Testimonials.

RATTLESNAKE CANYON, August 26, 1869.

GIANT POWDER COMPANY:

Dear Sirs:—At the request of C. W. Gilbert, agent of Giant Powder at Downieville, we cheerfully answer certain questions propounded by you. The bank in our claim is composed of hard cement for the depth of about seventy feet, and then comes hard pipe clay, into which we bore horizontally a six-inch hole, the distance of twenty-six feet, requiring two men three days to bore and blast, into which we put 100 pounds of your powder, which cost (laid down here) \$129; wages, \$18—total, \$147. It seemed to raise the mountain about one foot, and it then settled back again. It did more execution than we could expect—far, far beyond what we thought it could, and far beyond our most sanguine expectations. It tore the ground in all directions for a space of seventy-five feet on each side of the blast, and broke large boulders into numerous pieces. One boulder in particular, that was twelve feet through, which was in sight on the face of the bank, and at least thirty from the powder, was crumbled into pieces; in fact, the whole bank is crumbled. We do not want the bank down, it would be in the way; but we are satisfied that when we get water out this winter, it will wash down with ease, as it is now one mass of crumbled matter. The blast did a great deal more benefit than one we put off last fall, requiring four men six weeks, day and night, and fifty kegs of black powder, costing nearly \$600. In fact, it is impossible for us to describe the great result of this 100-pound blast; a person must see it in order to realize the great action caused by your powder. We intend, in three or four weeks, to put off three more blasts this fall; two of 100 pounds and one of 200 pounds, and will expect great results. If they do as the last did, it will be the greatest invention of the age in blasting pipe clay, and will make our mines worth thousands; with black powder they are worthless.

Yours truly, HUGHES & FLINT.

DOWNIEVILLE, August 27, 1869.

MESSRS. BANDMANN, NIELSEN & Co:

Gents—I send an elaborate report from Messrs. Hughes & Flint, which you can rely on as correct, and, as they say, it is impossible to tell the great result. Persons not interested say that to step on the top of the bank it seems that you would go down. I hope the next blast will prove a success; if they do, it will make a great change in blasting. That was the great

reason for parties selling out there—there was no way to get the pipe clay out of the way. Messrs. Hughes & Flint bought a good deal more ground.

In haste,

C. W. GILBERT.

(From the Mining and Scientific Press, January 16, 1869.)

SAN FRANCISCO, January 16, 1869.

EDS. PRESS:—As a matter of some interest to the owners of mines, I beg to lay before your readers some facts connected with the use of Giant Powder in the Oakes and Reese mine, in Hunter's Valley, Mariposa County, belonging to Messrs. Robinson & McAllister.

We have used the powder entirely since last April. In its use the steel consumed is of uniform size—three-quarter inch octagon. Hammers (short handles) weighing three and a half pounds. The country rock is hard and tenacious. The veins of quartz are narrow, varying from ten inches to three feet, generally running from one foot to twenty inches in width, with little or no gouge.

The system which Mr. Cassel, superintendent of the mine, has introduced (and which can only be used to advantage with Giant Powder), is to pay the miners by the foot in depth of hole drilled; the miner doing no blasting, nor does he handle any rock, his simple duty being to drill holes where instructed.

The underground superintendent, or head blaster—one for each shift—instructs the miner where to drill a hole. When the hole is drilled to the depth required, the superintendent measures it and takes a memorandum of the same and sets the miner at work elsewhere. As soon as the hole is measured the blaster loads it with from 2 to 2½ ounces of loose powder, fills the hole with water, covers it, and leaves it until the men leave it at the time of shift. As soon as the men have left the mine, this blaster with his fuses, with cap or exploder attached, makes his round, and removing the cover from the hole, drops the fuse into the hole, works the exploder into the powder, which is quite soft, fires the fuse, and in a very few minutes will explode all the holes drilled during the working shift. As soon as the explosions are made, the rock men and skip men clear away the debris which may be in the way of drilling new holes, and when the men again come into the mine there is work for them ahead in drilling. A blast is only fired when the men are at work on the mine when it becomes necessary to remove material. Thus it will be seen that no time is lost in blasting.

My experience since April last leads me to know the following facts in the use of Giant Powder as against gunpowder:

FIRST—The amount of work which can be performed in a given space in a mine is nearly double.

SECOND—The consumption of steel is about one-half.

THIRD—The consumption of hammers is about one-half.

FOURTH—The consumption of candles is about one-half.

FIFTH—The width of the drifts or stopes is only about one-half, requiring so much less material to be removed or hoisted from the mine.

SIXTH—The mining timbers are of shorter length.

SEVENTH—The ore raised from the mine is broken by the force of the powder, so as to require less spalling for this mill.

EIGHTH—The progress of the work in the mine is expedited a least 40 per cent., and in wet mines (the progress is increased full 50 per cent., if not more).

The miner's pay roll for the mine during October was only \$2,429.03, and during this time this force not only kept the 12-stamp mill busy day and night, but the yield of ore from the mine has so increased that another battery is now being erected of four stamps more—sixteen stamps in all. These sixteen stamps could not be kept employed from the mine, with common powder, short of a pay roll of \$8,500 to \$9,000 per month. Thus much for the use of Giant Powder for the owners of the mines. Now comes the advantage to the miner.

The miner never incurs any danger from the use of the powder, as we have never met with an accident in its use, and is never injured in the hands from a careless striker, and when the miner is used to this powder, and understands its peculiarity and great safety, he returns to the use of gunpowder with reluctance. It may be as well to state that I never heard of any trouble caused by sickness or disease in the use of this powder in the mine.

So far as the miner is concerned, he can earn more money with a three-quarter inch steel and small hammer than in any other way. It is true he must earn his money, and is not paid by the day. The price paid in the Oakes and Reese mine is 37½ cents per foot of hole drilled. In October there was drilled 6,476½ feet of hole, costing \$2,429.03. The following list will exhibit the amounts earned by miners most expert in the use of single-hammer drills in October—27 working days:

P. Belci.....	\$130 20
L. Bolvia.....	124 33
J. A. Wilson.....	131 77
B. Kendall.....	163 77
S. Cox.....	122 25
S. Uran.....	130 74
B. Picard.....	104 56
H. Laffy.....	\$97 30
F. Gill.....	94 66
F. Lastrade.....	90 72
J. Fortuna.....	84 50
H. Boyle.....	81 77
J. Martin.....	90 49
L. Battola.....	84 93

and many others ranging below the above amounts, falling short either because not work-

ing full time, or from not being expert in the use of the single hammer. Still, any system of mining where a miner willing to work can earn as high as \$131.77 per month, of twenty-seven working days, must insure to the benefit of the miner, and particularly so when the mine owner is willing to pay such wages. One thing is certain, that with Giant Powder and the use of small steel and hammers, the miner must earn his money, and cannot shirk his work, as is too often the case under the old system of mining.

(From the Mining and Scientific Press, January 20, 1869.)

Additional Facts.

SAN FRANCISCO, Jan. 25, 1869.

EDITORS PRESS:—Noticing in your paper of the 16th, a communication having reference to the use of Giant Powder in the Oakes and Reese mine, belonging to Mr. McAllister and myself, I beg to state that during the past week our superintendent, Mr. Cassel, has let the following contracts for work on the mine:

1. Sinking the main shaft 50 feet from the 278-foot level, at \$60 per foot—contracting parties furnishing everything.
2. Drift west, on Oakes and Reese vein 50 feet, at \$13 per foot—contractors furnishing everything.
3. Drift south, 50 feet, at \$10.75 per foot.

The same work has heretofore cost us, with the use of black powder, as follows:

1. Sinking main shaft, \$90 per foot.
2. Drift west, Oakes and Reese vein, \$30 per foot.
3. Drift south, Blue Lead, \$25 per foot.

Thus it will be seen that in these three contracts the mine owners save as follows:

1. Sinking 50-foot shaft \$30.....	\$1,500 00
2. West drift, 50 feet, at \$17.....	850 00
3. South drift, 50 feet, at \$14.25.....	712 50
Total saving.....	\$3,062 50

In addition to the saving in dollars and cents, it is also the important item of saving in time, as the time occupied in finishing contracts with Giant Powder is only about one-half the time required with use of ordinary powder.

The contractors, even at these low rates, are better satisfied with the prices than under the old prices with the common powder.

Very respectfully,

L. L. ROBINSON.

Here is a testimonial from a Cornish gentleman:

Having for eighteen months used Giant Powder in the Dana Tunnel, near Dayton, State of Nevada, I take pleasure in saying that I never, in all my experience as a miner (of twenty-six years standing), used a more effective or cheaper blasting agent, for the amount of work done, nor do I recollect experiencing the least ill-effects from its use. I heartily recommend its use.

SAMUEL RICHARDS.

SUTTER CREEK, Cal.

SMARTSVILLE, April 14, 1869.

MESSRS. BANDMANN, NIELSEN & Co., San Francisco.

Gents—The steel has got here and stands the rock first rate. I have got eighteen men on Giant Powder, on the hardest face, where they made 10 feet in a month with black powder, working six men. We made 9½ feet in thirteen full days with six men. That shows some improvement. Will probably make 16 feet in a month when the men get used to the single hand drilling.

It has been hard to get men to drill single handed; it makes their arm sore at first, and they have to lay off some.

R. L. CRARY, Superintendent.

[Extracts from some few newspapers.]

CORRESPONDENCE.

The weekly Colorado Herald, of December 31, 1870, has the following:

Economy of Giant Powder.

Some time since, in an article upon this powder, we mentioned our desire to give any facts that could be furnished by those using Giant Powder, that would tend to show its value in comparison with ordinary black powder. Mr. Womack has furnished us a statement which comes to the point exactly. There are probably not many mines in the country where the difference would be equally great. The Seaton is particularly adapted to the use of the single-hand drill. The work spoken of in the following statement, was foot, or under-hand stoping. One man worked with single hand drill, and two other good miners worked opposite to him. The result was as follows:

FIRST DAY'S WORK.

One man fired five charges of Giant Powder, bored eight feet of ground in soft rock, and used four cartridges. The cost of each cartridge was 30 cents. Total cost of powder first day, \$1.20. Cost of labor first day, \$3.50; cost of labor and powder, \$4.70; the cost of double-hand drilling, two men, \$7.00; powder, 60 cents; total \$7.60. Amount of work performed by one hand hammer equal to same work previously performed in the same time by two men with large drills, using black powder, in the same kind of rock of the same drift, saving \$2.90. Gain, 38 per cent.

SECOND DAY'S WORK.

One man fired five charges of Giant Powder, bored eight feet of ground in ordinary rock,

used two and one-half cartridges. Cost of powder 75 cents; cost of labor and powder, \$4.25. The cost of double hand work, \$7.60. Amount of work performed equal to double hand work; saving, \$3.35. Gain, 44 per cent.

THIRD DAY'S WORK.

One man fired seven charges of Giant Powder, bored thirteen feet of ground in ordinary rock, and used eight cartridges. Cost of powder, \$2.40; cost of labor and powder, \$5.90. The cost of double hand work, \$7.60. Amount of work performed, one-third more than by double-hand drilling. Value of extra work, \$2.53; saving, \$4.23. Gain, 55 per cent.

FOURTH DAY'S WORK.

One man fired seven charges of Giant Powder, bored ten feet of ordinary rock, and four cartridges cost \$1.20. Cost of labor and powder, \$4.70. Cost of double drilling, \$7.60. Amount of work performed, one-fourth more than by double-drilling. Value of extra work, \$1.90; saving, \$4.80. Gain, 63 per cent. Saving in four days, \$15.28. Gain, 50 per cent.

Time occupied to drive drift and stopes on No. 2, Seaton Mine, 25 feet long, two and a half feet wide, 10 feet deep, twenty-three days of nine hours each. Cost of labor, \$80; powder, \$16; caps, \$2; fuse, \$3; candles, \$3.80. Total cost, \$105.30. Cost per foot, \$4.30. Cost of same drift by double-hand drilling, \$8.40 per foot.

Giant Powder at Grass Valley.

From the Grass Valley Union, of the 11th of April, 1872, we copy the following statement of the Supt. of the Eureka mine on the relative merits of Black and Giant Powder:

GIANT AND BLACK POWDER.—It is well known that six men have been engaged in the Eureka mine, for the last month in running a cross-cut, and that these men have been using Giant Powder as a blasting agent. During the month the six Giant Powder men made forty feet, the rock through which they ran being very hard in some places and not so in any spot. In the five months previous an average of twenty-one feet per month was made with black powder and double drills. The men working Giant Powder have not been sick a minute during the twenty-six days they have been working in the cross-cut. Three of the men who worked with the Giant Powder were green hands at underground mining. We are furnished with the following statement which compares the cost of using the two kinds of powder:

STATEMENT.—In regard to the trial between Black Powder and double hand drill, and Giant Powder and single hand drill, in the cross-cut of the Eureka mine: Six men with double hand drill and Black Powder in five months drove one hundred and five feet, or twenty-one feet per month. Six men with single hand drills and Giant Powder drove forty feet in one month at a cost to the Eureka Company as follows:

Double hand Drill, expense per month, \$491 20	
Single hand Drill, expense per month, \$573 45	
Cost per foot Giant Powder and single hand drill.....	\$14 33
Cost per foot Black Powder and double hand drill.....	23 30
Or a saving in favor of single hand drill and Giant Powder of 38½ per cent.	

Giant Powder in Placer County.

By permission of the Bellevue Mining Company, near Newcastle, we publish the following statement:

Experiments with No. 2 GIANT POWDER, single hand drilling, versus Black Powder and double hand drilling:

East Drift—with black powder—9 days,	
2 men at \$3.00 each.....	\$54 00
90 candles—15 lbs., at 20 cents.....	\$3.00
Black Powder and Fuse.....	2 25 5 25

Made 6 feet cost per foot.....	\$59 25
East Drift—with No. 2 GIANT POWDER—6 days, 1 man at \$3.00.....	\$18 00
No. 2 GIANT POWDER—6 lbs at 50 cts. 3 00	
Fuse and candles—3 lbs.....	3 60

Made 6 feet cost per foot.....	\$24 60
Saving in favor of GIANT POWDER.....	\$4 15
per foot, or 58 per cent., besides the saving in time.	5 74

FRED'X JONES, Supt Bellevue Mine.

NEW TESTIMONIALS.

VIRGINIA CITY, Dec. 27, 1872.

MESSRS. BANDMANN, NIELSEN & Co.,
General Agents Giant Powder Co.

Gentlemen—In answer to your inquiry in regard to the efficiency and saving. Giant Powder possesses over black powder, I herewith state, that I have been using the Giant Powder since three years, and find in its use a saving of 50 per cent. over black powder. I consider the Giant Powder much safer than any powder I have ever used. JAMES G. FAIR,
Supt. Hale and Norcross Silver Mine.

NEVADA CITY, Cal., Dec. 20th, 1872.

OSCAR W. WHITE,

Traveling agent Giant Powder Co.

DEAR SIR:—In reply to your request, I would state that I have used Giant Powder for the last two years, and find it a saving of fifty (50) per cent over black powder. Yours truly,

J. H. HELM.

Supt. Gold Tunnel Mine.

NEVADA CITY, Cal., Dec. 20th, 1872.
OSCAR W. WHITE,
Agent Giant Powder Co.:
DEAR SIR:—In compliance with your request that I give you a statement as to the saving made by using Giant Powder in the Nevada Quartz mine, I would state that it is fifty per cent cheaper than black powder.
Very truly yours,
JOHN BERRY,
Supt. Nevada Quartz Mine.
We shall from time to time publish facts and figures from all the prominent mines on the Pacific Coast in relation to the merits of the Giant Powder.

MESSRS. BANDMANN, NIELSEN & Co.,
General Agents Giant Powder Co.
At your request I herewith state that I have been using the Giant Powder since a long time in the Amador Mine, Sutter Creek, and consider the Powder a great saving over black powder. It is the safest explosive I have ever used.
JOHN A. STEINBERGER,
Supt. Amador Mining Co.
Sutter Creek, Jan. 4, 1873.

Important to Railroad Contractors.

Having stated in the foregoing circular the number of manufactories owned exclusively by the inventor, Mr. Nobel and his partners, we have recently received from this firm the information that a tunnel through parts of the St. Gothard mountain in Switzerland, has been decided upon. This work, it has been calculated, will take eight years to finish. A partner of Messrs. Nobel & Co., Doctor Bandmann, made the first blasts at this contemplated tunnel with Giant Powder, or Dynamit, as it is called in Europe, and met with such success that the managers of this gigantic work, Messrs. Favre & Co., concluded at once negotiations to supply them with this powder for the whole work.

The Giant Powder has also recently been successfully introduced in the Hoosac Tunnel, in the State of Massachusetts, where, until then, nitro-glycerine and other explosives have been used.

In conclusion, we will add that in our neighboring State of Nevada, the "Sutro Tunnel Company" are using the Giant Powder, and find it the best and most labor-saving blasting material.

In all the deep mines on the Comstock lode in Nevada, Giant Powder has been used since its introduction without injurious effect to a single miner.

The rapidly growing favor which Giant Powder finds with all who are engaged in blasting on this Coast, and in the Eastern States, is its best recommendation.

BANDMANN, NIELSEN CO.,

210 Front Street. SAN FRANCISCO.

Rain Fall.

As an evidence of the difference in respect to the moisture of the earth this year from what it was last, we have a striking illustration in the reservoir of the Contra Costa Water Company. Last year it required a fall of twelve inches of rain to fill the reservoir. This year, with an additional height of fifteen feet, the reservoir was filled by a rain fall of only six inches. We judge by this that six inches of rain the present year is equal to twelve last. That is, the earth had become so thoroughly dried by the three years drought, that it required a rain fall of six inches to put the earth in the same condition, in respect to moisture, that it was the present year before any rain fell. The earth in this State is like a sponge, retaining the moisture as a reserve power to meet the exigencies of dry seasons. The hot sun and dry atmosphere acts as a powerful attraction, forcing the moisture from the lowest depths to the surface. The three dry seasons had about "wrung the sponge dry," and the reason of the great amount of water which the earth absorbed last year, and the heavy fall of rain necessary to make any perceptible rise in the streams and fountains. There is a scientific principle connected with this incident which we turn over to the University professors and students for further elaboration.—Oakland Transcript.

COFFEE.—Having succeeded in producing the growth of nearly all the kingdoms of Europe and States of the Union, growing more wheat than the Northwest, taller corn than Indiana and Illinois, higher trees than Maine, and larger onions than Connecticut, rivaling with her crude young vineyards the vineyards of the old Rhine, and the world-famous champagne districts of France, giving pampered fashion a more delicate silk than Italy, the protan and fertile Golden State is now embarking in coffee culture; and her enterprising and energetic sons tell us that in a few years their "cafetals" will produce more and better coffee than all the old countries of the earth put together. And it is more than likely that the Californians will keep their word in the matter, for they have never yet broken a promise of this kind, and in imagination we may confidently picture California coffee prized above "Java" and "Mocha" in the great Continental Exhibition of 1867.—Phil. In.

DEWEY & CO., American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, \$10 (in cloth); in leather, \$12. Forwarded by mail, in cloth, \$14.40 currency; in leather, \$18.75. Issued and for sale by DEWEY & CO., Patent Agents and Publishers Mining and Scientific Press, S. F.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Mining and Scientific Press office, S. F. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

"From the Beginning to the End."

SANTA CLARA COLLEGE, Oct. 30, 1872. Messrs. DEWEY & Co.—Gentlemen:—The letters patent for my invention, "The Rein-holder," have just come to hand, and I beg to thank you for your gentlemanly and business-like method of dealing from the beginning to the end; and whether I am successful or not, with regard to the sale of my design, I shall surely recommend you to all I come in contact with, if they need letters patent obtained, or otherwise. Yours very truly, E. C. E. VILE.

Can't Get Along Without It.

A gentleman writing to our Patent Agency from Ophir City, U. T., August 20th, closes with the following: "I have been a subscriber to your valuable MINING AND SCIENTIFIC PRESS for many years, and I can't see how any miner or millman can get along without it." Office, 338 Montgomery street, S. F.

MENZO SPRING, MANUFACTURER OF DR. DOUGLAS BLY'S PATENT ARTIFICIAL LIMBS.

Southwest corner of Second and Jessie streets, S. F.

DR. BLY'S ANATOMICAL LEG,

with universal ankle motion. (The accompanying cut is its illustration.)

These Legs, besides being made of the best material, in the most artistic manner, are properly fitted to the wearer; and for this a practical guaranty is given. A trial, and satisfaction before pay is required.

For full price list, and descriptive circular of legs and arms, etc., call on or address

MENZO SPRING,

SOMETHING NEW.

We have for sale the Right to the Pacific Coast for a new and useful invention that is needed in every family. It is easily manufactured and requires but a small amount of capital to commence with. A number of orders have already been taken, which will be turned over to any party who may purchase the patent. Samples can be seen at our office, or descriptive circulars will be sent to any address on application.

WIESTER & CO.,

17 New Montgomery Street, San Francisco

The Mining and Scientific Press Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the Press will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Mine Structures; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from uneducated masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined to short articles, is our endeavor.

For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and nature and progressive intellects of both men and women.

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untrodden field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiments often save costly experiments and disastrous results.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so cheaply, or in so convenient and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—\$4 per annum. Single copies, post paid, 10 cents. Address

DEWEY & CO

MINING AND SCIENTIFIC PRESS AND PACIFIC RURAL PRESS OFFICE, 338 MONTGOMERY ST., S. F.

ONE DOLLAR A YEAR PACIFIC COAST

Mercantile Director.

This is a new 16-page monthly newspaper, of special information for wholesale and retail tradesmen. It will also contain a great deal of interesting and important to all business and professional men on the coast.

OUR TABLE OF CONTENTS
Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the Fluctuations of the Wheat Market; Rates of Ocean Freight—corrected monthly; Illustrations and Sketches of Prominent Men and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter and reviews for various branches of trade, including "Grocery and Provision," "Dry Goods," "Drugs," "Building," "Trades and Manufactures," etc., etc.
Our first issue consist of 16 pages, embracing TWENTY-THREE COLUMNS of important reading matter for the tradesmen—most original and by first-class writers. Sample copies, post paid, 10 cents. Yearly subscription, in advance, \$1. Subscribers to the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS will be supplied at half price.

Published by MURRAY, DEWEY & CO.,
At the Publishing Office of the Mining and Scientific Press and Pacific Rural Press, San Francisco

A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cents extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press.

"I Would Not Be Without It."

Messrs. DEWEY & Co.—I prize your paper very highly, as it is the best of its kind I ever saw, and I would not be without it. Yours truly, J. P. V.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JANUARY 18, 1873.

VOLUME XXVI.
Number 3.

The Great Industry of the Pacific Coast.

While recognizing the fact that the agricultural resources of California are apparently unlimited, and that from them the majority of the people of the State gain their daily bread, there is no doubt but that the basis of the wealth of the States and Territories comprising what is familiarly known as the Pacific Coast, is in the mines. During the past year the mines have produced in solid bullion the enormous sum of \$62,236,914, of which California alone is credited with \$19,049,098. The product of the year shows an increase over that of 1871 of \$3,952,884. Does not this prove material progress and advancement, and augur well for the future? The history of the past few years has been a history of successive advances each more marked than the last, and we have no reason to suppose that this progress will be stayed.

It was not many years ago when the hardy pioneers who first braved the dangers of the plains and rugged mountains looked down upon a field magnificent, but wild and unexplored. Could their visions of the future of the lands upon which they looked, golden as they were, have been half as bright as the realization has proved to be? Could it have occurred to them that the placid streams on which they gazed with wondering eyes, would be turned aside and their beds laid bare by men in search of gold; that the magnificent towering mountains and broad hills would be compelled to disgorge their hidden treasures in countless millions; that the deep cañons through which fretful streams burst their way would be pierced by the bare-armed miner in his search for polished gold in the hidden beds of ancient rivers? If these thoughts should have passed through the minds of those brave men, it is impossible, we say, that they could have predicted half of what has come to pass.

If we look back upon the struggles of the early pioneers and mark the steps they made, we can but wonder at the energy and industry displayed, even under the most powerful incentives of industry—gold. True, mining enterprises in those days were of a rude and temporary character, and little science was used in the processes then in vogue for the extraction of the precious metals, but we owe them much, for we of late years have profited by their hard-earned experience, for which, to tell the truth, we give them less credit than they deserve.

Our mining interests are now being developed on a grander scale than has ever been witnessed. It has been proved that by judicious and economical management mining will pay a handsome profit on the capital invested, and this fact is now acknowledged by all. The great developments on the Comstock lode in deep levels, has encouraged owners of heretofore unproductive, but promising mines, to prosecute work with more vigor and with better chances of success. What is true of these mines will probably be true of many others yet unknown to fame. A great number of domestic mining incorporations have been formed, and considerable foreign capital has been invested in our mines. Smelting-works have been erected in "base-metal" districts, improved mills and furnaces constructed and in operation, and ditches and reservoirs dug to increase water supply.

In fact since the advent of the first miners to this coast the whole business of mining has been revolutionized. Steam hoisting apparatus has superseded the old system of whims,

and steam pumps have taken the place of buckets and hand pumps. Wire tramways for the transportation of ore from mine to mill are rapidly being introduced and have proved successful. Railroads make transportation cheaper and enable mines to be worked that would otherwise be idle. Giant Powder has done its

manufacturers, makes people progressive, assists the national finances and makes the country prosperous and powerful. England's example is one for us to follow in this matter; her mines have increased her wealth and importance and created manufactures and commerce. Russia and Germany both owe much to their

Fig. I.

VERTICAL SECTION OF A QUARTZ MINE.

share in simplifying and cheapening mining operations and has in reality proved a boon to the hydraulic, as well as the quartz miner. Diamond drills are used in certain localities with great effect and will no doubt be consid-

mines, and fully appreciate the fact. We on the Pacific coast know the importance of this industry better than those in other States, and recognizing it, endeavor to foster this particular branch in as great a degree as possible.

Fig. II.

MINERS AT WORK ON A BAR.

sidered more necessary mining implements, for prospecting purposes in ten years from now, than they are at present. The Stetefeldt Furnace, improved stamp mills, the chlorination process, amalgamating pans, settlers, patent rifles, quicksilver, patent hydraulic nozzles, safety cages and other appliances too numerous to mention have sprung from the necessities of the day, and assist in increasing the profits. New mining districts are being prospected and developed, and new and beneficial laws are in vogue. The advance which has taken place has materially assisted the manufacturers of the coast and increased the market for home productions.

The mining industry creates commerce, helps

portion of the shaft below the tunnel is called a winz, from near the bottom of which the miners are seen running another drift, or "gallery" (as such a work is usually called,) to strike the vein at a lower depth.

Fig. 2 represents miners at work upon a "bar" upon the bank of a river. Flumes have been laid from a point up the river, whence the water can be easily taken out, and as the gravel is thrown in and washed, the flumes are gradually moved further and further from the river until the bar is "worked out."

At the present time our quartz mines are worked by steam hoisting and pumping apparatus of intricate and expensive workmanship; tramways are laid in the levels and adits; the cages for hoisting the ore are constructed with great care to avoid accidents, and thousands of improvements have been made which would astonish a "49'er" who had not before seen them. The gravel which once required stamps to crush it is now torn to pieces by the use of water, and the wonderful forces applied tears the rocks and fractured boulders to pieces almost instantaneously. How different from the days when a tin pan and a pocket knife, or a rocker and shovel were the tools of a miner.

We have a bright future before us too, as well as a past, and as gold hunting will always be an object of ambition, a thousand hills, rich in their inexhaustible supply must yet give up their treasures. Millions of tons of ore yet to be extracted will be delivered at metallurgical works yet to be erected. Still more perfectly and cunningly devised machinery and appliances will economize our expenditures and increase our profits. Millions of tons now useless will be utilized. Railroads threading our mountain cañons will help to populate the State. Products now not searched for will be made articles of commerce. Besides our gold and silver we shall mine more extensively for copper, iron, platinum, chromium, gypsum, nickel, porcelain clay, arsenic, antimony, quicksilver, sulphur, lead, tin, bitumen, coal, marble, salt, borax, etc., etc., and as fast as such one of these mineral products are brought to light, the demand for them will increase, and manufacturers be created to add yet more riches to our favored country.

AIR BRAKE.—A series of experiments are being made in England with the Westinghouse air brake which has proved so effective in this country. Our cousins appear to be a long way behind the age if they have just begun to recognize its merits. At one of the trials the rails were in bad condition, being greasy with a drizzling rain, but with the aid of this brake a train traveling 50 miles an hour was brought to a standstill in 18 seconds, and in about 175 yards.

ALASKA GOLD.—There is an excitement in Sitka over the recent discovery of a quartz lead, the ore from which is reported rich in gold. It would not much surprise us if Uncle Sam's newly acquired property would turn out a good mining region when it is thoroughly prospected. Good coal has been found there in considerable quantities, and we have heard of gold discoveries before this one, but as far as we know, no steps have been taken to prove the value of the locations beyond mere assays.

MECHANICS' ARTS COLLEGE LECTURES.—The second lecture of the course being delivered before the Mechanics' Arts College was delivered on Saturday evening last, by Professor D. C. Gilman on the "Physical Structure of the United States in Reference to its History." The lecturer explained how the great natural divisions of the country influenced colonization and was, interesting throughout.

The two cuts shown on this page are typical of the mining interest on the Pacific slope. By glancing at them and comparing the reality of our operations as they now are, we can realize the stride taken in the past twenty years.

Fig. 1, we will remark for the benefit of such readers as may be unacquainted with such operations, represents an ideal section of a quartz mine. The vein is shown upon the left, growing wider, as it increases in depth from the surface. A shaft has been sunk, which cuts the vein near the surface. A tunnel has been driven into the hill to intersect this shaft, and just below the intersection a drift has been run from the shaft to the vein, where the work of taking out rock has been commenced. That

CORRESPONDENCE.

Japanese Mines and Minerals Again.

EDITORS PRESS:—A reporter of the MINING AND SCIENTIFIC PRESS did me the honor on the 23d ult. to call and examine my collection of Japanese minerals. As that gentleman arrived rather late in the afternoon, and seemed to be in a great haste, his examination and his hastily taken notes were consequently incomplete; and in reading your insertion "Japanese Minerals and Mining" in your next issue I find that in two or three cases, I must either have misunderstood the questions of your reporter, or he must have misunderstood my answers.

From 1864 to 1869 I traveled in Northern Asia, visiting the Ural mountains, the Altai, Western and Eastern Siberia, the watersheds of the Obi, Yenisei and Lena, Northern Mongolia, the Amur countries, Northern and Eastern Mandshouria and Kamtschatka. On the first of June, 1869, I embarked in Nicolajefsk at the mouth of the Amur, and after having touched the Russian ports of DeCastri, Olga Bay and Wladivostok on the coast of Mandchouria, I arrived in Hakodadi, island of Yeso, Japan, on the 28th of June, and in Nagasaki on the 19th of July. From the day of my arrival in Nagasaki up to the end of November 1869, I visited parts of the island of Kiou-Siou and the Goto-land across the Kiou-Siou Bay, Hiogo and Osaka on the Great Nippon, and the surrounding countries to a distance of, from 25 to 30 miles. On the 25th of November I entered the service of the Japanese Government at the Imperial Academy in Yeddo, and during my two years service I profited of all the College vacancies and of nearly all the holidays, to go on longer or shorter exploratory excursions into the country, the adjoining provinces of To-Otomi, Soubo-Inga, Ksi, Izon, Sagami, Mousssi, Simoosa and etc.

After I left the Government service, I made a few other excursions into the Webster islands, the island of Thoshima, Kamakura, and others, so that my travels in Japan may have occupied in all, a little over 10 months, about a year as I stated to your reporter; the word "about" was omitted in your article. Again I beg leave to observe that I have not visited all the accessible parts of Japan; as for instance, Nagata is a port, open to foreigners, which I have never had occasion to visit. On the other hand, I have, by special permission of the Japanese Government, visited countries beyond the treaty limits, as Odowara, Atami, Ashy-Noyou and the Hakoni mountains, where I made important observations, and found a rich harvest for my collection.

With regard to placer gold being frequently brought in for sale, I beg to say that it is not exclusively to English traders, but to foreign traders in general, that such offers have often been made. In the few cases, which came to my knowledge, (the gold having been handed over to me for assay) the traders were not English but merchants of other nationalities. The words "to English traders" might induce the readers of your Scientific columns to believe that English merchants in Japan had a sort of monopoly in this line of business, which is not the case at all.

Alum could be exported from Japan in considerable quantities, if its exploitation was carried on in a more rational footing, which is however not the case yet.

Japan as a Mineral Region.

Japan is one of the richest mineral regions on our globe, and may—once all its treasures laid open—well rival with the Ural mountains, with California, Mexico or any of the rich mineral states of South America. Besides the riches represented in my collection, there are strong indications that the mountains in the North of Nippon, which, from 38° N. N. up to the Arv-Mori Bay 41° N. N. divide the territories of Mutsu on the East and Dowa on the West are rich in auriferous quartz, and that the placer gold, often clandestinely offered for sale, is found in the tributaries of the Fia-Ami-Karwa, a river which takes its source on Mount Yvayasi, 40° N. N., runs along the east chain of mountains and opens into the Eastern Sea of Japan near the island of Fugami 38° 40' N. N. Many rich mines of different metals and other useful minerals also, as graphite, lime, white and red chalk, red and yellow ochre, realgar, opment, elastic bitumen, Iceland spar, fluorite spar, talc in different shapes and qualities, alabaster, meerschaut, purrolane, etc., are known to exist in the interior of the country, but are not worked yet, or only very imperfectly by the peasants, who only work on the surface when they have a day or two to spare from the works in the rice plantations, but never take the trouble to go deeper, where the best qualities of minerals are found.

Although the regular and rational working of these mines, either by concession to Japanese

or foreign capitalists or by exploitation for the Government's own account under the management of a foreign engineer, would beyond any doubt greatly and rapidly improve the finances of Japan, as well as the social condition of the working classes, in procuring permanent work for thousands of homeless and friendless razzias, (poor outcasts), who during the cold season are often seen by half doze dying of hunger and cold on the wayside of the Toocaido between Yeddo and Yokohama—strange and deplorable cases of revolting misery in a country of so great agricultural and mineral riches, and so flourishing a commerce—yet the Japanese Government hesitate to open the mineral treasures of their country, for fear, perhaps, of too great an influx of foreign immigration, which would cause political trouble in the country. Let us hope, however, that the present liberal Government of Japan, who have declared themselves so open and firm for social progress and civilization will soon have subdued the few reactionary elements in the Empire and be free after to carry out without reserve or fear of internal political troubles, the great reforms, which are necessary yet to make Japan a truly rich, civilized and well-governed country, worthy to take its social and political standing among the civilized countries of Europe and America.

Copper Mines.

The provinces known to day to be the richest in mineral wealth in Japan, are the provinces of Satsuma, Figo and Fieen on the island of Kiou-Siou, the provinces of Kanga, Mino, Bizen and Kafi, on the Great Nippon and the little island of Sado near the west coast of Japan. The best and richest copper mines are located in Kiou-Siou. Japanese copper has been known for centuries as the best in the world. It contains a fine percentage of gold. The Dutch, who for more than two centuries have been the only civilized nation in commercial relations with Japan and who had permission to export from Dessima one whole cargo of copper every year, always smelted the Japanese copper again in Holland and extracted the gold by an amalgamating process. The Japanese of our days know the value of their copper better than their ancestors, and take the gold out of it themselves before they allow it to go to the market.

Coal.

Japan has already several great coal fields in full and systematic exploitation. The qualities, although inferior yet to European or American coal, begins to contend successfully with the Australian coal, which is shipped yearly to the ports of Yokohama, Hiogo and Nagasaki. Several steamship companies begin to mix Australian and Japanese coal in equal parts and find the fuel good, and the arrangement profitable, as Japanese coal is a great deal cheaper than Australian coal, and only very little inferior in quality to the latter. Deep shafts have been sunk now on several rich strata, and better qualities found than before. I know about the existence of two more promising coal fields with rich strata, which are not worked yet, and there may be many more, known, perhaps, only to a few peasants in the neighborhood.

Fine Kaolin and a fine bluish clay abound, especially in the southern part of Nippon, in Kiou-Siou and Sitokki. These two minerals furnish the material for that fine and almost transparent Japanese earthenware, so much admired, and exported to all parts of the globe.

Geological Formation.

The whole Japanese Archipelago is of volcanic geological formation. Many of the smaller islands consist only of lava, obsidian and pumice stone; on the larger ones, taken in a totality, almost all the geological formations are represented, as seen in my collection. Active volcanoes are at constant work yet in the south and in the north of the country; those in the centre are all extinct and the craters of the Fusi-yama and the Hakoni mountains afford ample material of study for the geological explorer. Earthquakes are very frequent in Japan, especially between the equinoxes, but never so violent as to cause great damage.

Japan has already two navy yards with dry docks, one in Nagasaki, and the other in Yokozaka, a few miles distant only from Yokohama. Yokozaka, under the direction of an able French engineer, has its foundries and extensive, well supplied workshops, where the engines and boilers are made for the steamers that are built in their yards. Several new steamers have been launched in Yokozaka; among others the "Kome," a fine paddle-steamer with a first rate engine, plying daily between Yeddo and Yokohama. The works and yards in Yokozaka are being enlarged for the construction of men-of-war.

Japanese Progress.

Yeddo and Yokohama will soon strip off what remains to them yet of their old Asiatic plegm, and become lively European or American cities. The two towns have their railway, their running steamers, their telegraph and etc. The streets of Yokohama are already lighted with gas, and those of Yeddo will soon enjoy the same advantage. In a few months the Yeddo will have its horse cars on rails throughout the whole town, and Yokohama will have the same only a few months later. The Japanese, men and women, are rapidly doing away with their Mongolian dresses and customs and adhere to the newest fashions of New York or Paris. Many fine buildings of modern architecture embellish the Japanese quarters of Yeddo and Yokohama, the old heavy nommons also are gradually disappearing and fashionable buggies,

landaus and light hackneys take their places. Japan is on its way to modern civilization, and no reactionary movement would be powerful enough now to stop it in its progress.

Yours, very respectfully, J. KADERLY.

"The Ancient Channels."

[Written for the Press.]

Much has been said and written on the subject of the ancient river beds, or, as they are more properly termed by some writers, "The Dead Rivers of California." Theories have been set up and each writer has taken pains to demonstrate his own particular theory.

One writer says the Dead River extends from Plumas county on the north to El Dorado on the south. Another that it rushes from the northern part of Sierra county to Smartsville, in Yuba county, and still another, that it runs in a northwesterly direction from Dutch Flat to North San Juan.

I do not propose in this article to contradict any of these theories, but simply adopt the idea upon which all appear to harmonize, viz: That a vast channel does exist and that traces of a dead river are too numerous to admit of a doubt as to its former existence, and wherever found it furnishes abundant proof of its own genuineness and the uniform richness of the gravel with which it is filled.

The question whence it came or whither it went, may be very interesting to the geologist or the antiquarian, but to the commercial world and the miner the great problem is, "Where can a spot be found on the line of this dead river where the gravel can be removed and the immense wealth therein contained set in circulation for the benefit of mankind?"

In general terms this can be answered by the assurance that everywhere the old channel is rich.

While in Calaveras county and El Dorado the miner is hoisting the gravel to the surface from a depth far below the beds of the present streams; in Placer, Nevada and Sierra counties he is conveying the waters of the highest mountain streams in ditches and canals to points on the same channel hundreds and in many instances thousands of feet above the beds of the present streams.

Prominent Mining Localities on the Channel.

Beginning with the fact that this ancient channel is filled with gravel from fifty to seven hundred feet in depth, of almost unvarying richness, and that wherever systematically worked, whether by drifting and crushing, sluicing or hydraulicing, it has paid the miner for his labor uniformly in proportion to the amount of gravel washed. The next question is what is the most profitable way to work it, and what localities afford the greatest facilities for extracting the gold from the gravel?

At Smith's Flat, El Dorado county, and at Ohili Gulch, in Calaveras county, the channel has been worked for many years; but being below the present stream beds, the gravel has had to be hoisted by steam or water power, which left but a small margin for the miner—still it paid.

At Gold Run, Forest Hill, Bath, Michigun Bluffs and Dutch Flat, in Placer county, it has been successfully worked by hydraulicing.

At You Bet, Red Dog, Quaker Hill, Blue Tent, Columbia Hill, North San Juan, French Corral and Smartsville, in Nevada county, it has been worked by the hydraulic process though more scientifically and on a much larger scale than at the former places.

The Formation.

All these mining operations develop the fact that the auriferous deposit contained in this channel, throughout its entire length and breadth, is composed of gravel mixed with clay, sand and boulders. The strata differing from each other in color and the size of the boulders and gravel, as well as in richness; the richest stratum being nearest the bed rock. The color of these strata is a deep blue at the bottom, fading gradually to a bluish gray toward the surface, and in exposed places assuming a reddish tint showing the presence of iron; the blue coloring of the lower strata being caused by the decomposition of vegetable matter buried among it, there being great quantities of petrified wood of all varieties found all along the channel.

In the channel proper the gravel is very compact and can be washed clean only by "air slacking," crushing or by the use of powder. The latter has proved to be the most successful method yet adopted. A few hundred kegs of powder will shake up a large bank of gravel which will then wash easily, and the miner can remove it very rapidly by hydraulicing.

Necessary Facilities.

The proper facilities for this class of mining are not found in every mining region along the old channel. On the contrary, there are comparatively few places where we find all the essentials for a successful mining operation combined. There are three things necessary to constitute a good hydraulic claim: first, a good bank of pay gravel; second, a plentiful supply of water; third, a good "dump" or outlet for tailings and other debris from the claim. Many of the places named above possess the first two of these requisites, and lacking the third, fail to pay half so well as other claims of no greater richness, but possessing a good dump.

At no point along the line of the old channel are these requisites more prominently observable than at Blue Tent, the point where the old channel is cut by the South Yuba river. Its depth and extent of gravel deposit, its facilities for a plentiful supply of water, and more particularly its dumping privileges are second to none in the State. The first is practically inexhaustible; the second will fail only when the South Yuba ceases to be an outlet for the eternal snows of the Sierras, and the third is afforded by a steep mountain side, seven or eight hundred feet of which intervene between the bed of the old channel and that of the South Yuba.

Need of Capital.

Up to a recent date the ground has been divided into small claims and worked at great disadvantage with small heads of water. These interests have gradually been consolidated till they are at present owned by four or five companies, who control not only this vast body of gravel, but also all the water rights, outlet, timber, etc., necessary to work it. Some of the claims are now being fitted up for working on a much larger scale than ever before and will no doubt make a good showing this season. But what is wanted here is a company possessing the capital to make one gigantic mining scheme out of this whole set of claims; bring in a ditch carrying five or ten thousand inches of water; run a tunnel sufficiently low to tap the hill to its center (which actual survey shows to be less than a thousand feet to where such a tunnel would strike the channel) and otherwise fit up this immense claim on a scale commensurate with its merits. We hope to see this done at no very distant day.

NEVADA.

The Sulphur Banks of Lake County.

These are situated near the shore of an eastern arm of Clear Lake, about eleven miles from the town of Clear Lake and one and a-half miles from the celebrated borax lake, from which they are separated by a ridge of mountains. The sulphur is found in a decomposed, volcanic rock, which is very much fissured; from these fissures issue the steam and hot gases which deposit the sulphur. The gas is most abundant toward evening, at which time it is impossible to stay in the "work holes" for any length of time, on account of the excessive heat and suffocating nature of the gases, which appear to issue at irregular intervals; for while examining some of the fissures containing sulphur, we could work for some minutes without inconvenience, when suddenly there would be an escape of gas, which would nearly suffocate us, causing dizziness and a desire to get out into the open air as soon as possible. These gas-escapes seem to have a fatal effect on quail and hares, as we found several dead in the fissures. They probably select these warm places on cold nights, and are killed by the noxious gases.

Evidence of solfatara action are evident along a line extending from the shore of the lake S. E. for more than half a mile, though the sulphur banks worked do not extend to half that distance. There are a number of mineral springs on the line of the "banks" among them soda, alum and borax springs.

One cavity, opened in working for sulphur, which we called "The Devil's Testkettle" resembles the "Witch's Cauldron" at the Geysers. The water is not so hot, but it keeps up a continual sputtering, and makes about as much noise as the "Cauldron." One of our party took one look at it, and concluded he had got enough of the sulphur banks, and was quite anxious, like the Tentonic gentleman to "drive on," thinking like him, that the Satanical regions were "not var vrom dis place."

On the border of the Lake near the reducing works is a hot spring containing borax, used by the Indians of the neighboring rancheria for washing the borax and the heat doing away with the necessity of using soap; the hot water and gas (carbonic acid) percolate up through the sand over an area of perhaps 100 feet square, part of the outlet being beneath the Lake. Localities can be selected of any desirable temperature from that of the water of the Lake to a temperature too hot to hold the hand in. During a recent stay of several days in the neighborhood, this spring was a source of comfort to our party, being an excellent washing place on cold mornings. The company owning the banks are taking steps to ascertain whether the springs can be utilized as a profitable source for obtaining borax; a well has been sunk some 50 feet from the works and 150 yards from the Soda Springs; strong borax water was struck at a depth of 18 feet.

Mr. Wm. Murdock has charge of the property; he employs six men and reduces something over two tons of ore per day; two furnaces are in use, and one out of repair. The retorts which will reduce about 200 tons before being renewed cost \$500 each at the works; wood costs \$3 per cord. When looking on while the workmen were "drawing" the furnaces it required but a very little stretch of the imagination to think one's self in the Lower Regions. There are other deposits of sulphur in that county and vicinity, of which more anon.

L. G. YATES.

Centerville, Cal., Dec. 25th, 1872.

FALL RIVER has 1,206,928 spindles, 27,498 looms, and an invested capital of \$27,000,000.

MECHANICAL PROGRESS.

The Use of Zinc.

In France, Belgium and Germany, the area of roofing annually covered with zinc is from 40,000,000 to 50,000,000 sq. ft., and the experience of 50 years shows that it forms a perfectly sound and nearly imperishable roof-covering. In England its use is unpopular, if we may use the expression, and mainly, we think, because the principles upon which it should be used are yet hardly understood. When first introduced, about the early part of the present century, there were no English workmen who thoroughly comprehended the nature of the material with which they had to deal, and a special knowledge is absolutely necessary.

In the first place, the expansion and contraction of zinc under atmospheric influences are greater than those of other metals in ordinary use. Copper, which is very efficient, but rarely used on account of its cost, approaches it most nearly, but the expansion and contraction of zinc is *pro rata*, nearly one-third more than that of copper. Therefore in the construction of drips, laps and other uniting points, it is necessary that, while being sufficiently sound to keep out the weather, a certain "play" to use the technical phrase, should always be allowed. Any attempt to solder together a zinc roof into one homogeneous body is certainly followed by buckling, cracking and failure, and this was a fruitful source of trouble in the earlier transactions.

Another mistake made was, that the zinc was used too thin. The process of oxidation which this metal undergoes is peculiar. The rusted surface does not rub off or blow away, but forms a sort of hard crust of enamel upon the surface of the metal, and, when laid upon boarding which is or may become damp, or exposed to steam or condensation below, it rusts on both sides. The thin zinc first introduced into England in this way were rusted through they then became brittle, and failure was the result. But if the zinc be of sufficient thickness, after a certain period of time oxidation ceases, and we have a body of solid, sound metal, encased above and below by a solid coating thoroughly impermeable to the accidents of weather or temperature, and which requires no painting. To give the exact figures described in the trade, No. 9 gauge is too thin, and perishes. No. 14 gauge may be generally recommended as sufficient.

There are various ways of laying the zinc. First, it may be laid in a corrugated form without boarding, the trusses of iron or wood of the roof carrying the weight; or one may lay it in what is called the Italian style, or rafter about 1 ft. more or less apart, with a corrugation at each rafter only; or in a third manner, upon a general surface of boarding, in the manner of a lead flat, the necessary drips, ridges, etc., provided for in the construction, with the extra allowance for expansion and contraction which the peculiar nature of the metal requires.—*The Architect.*

SOLDERING IRON AND STEEL.—Dr. Sieburger publishes the following methods for soldering iron and steel:

If large and thick pieces of iron and steel are to be joined sheet copper or brass is placed between the perfectly clean surfaces to be united, which are then tightly wired together. The joint is covered with wet clay free from sand, and dried slowly near the fire. When the mud is dry, the joint is heated by a blast to a white heat and cooled, suddenly if iron, slowly if steel. When brass is used, it requires less heat, of course, than copper.

For objects of moderate size, hard brass solder is made by fusing together 8 parts of brass and 1 part tin. Soft brass solder is composed of 6 parts brass, 1 part zinc, and 1 part tin.

For soldering small iron or steel articles, a hard silver solder composed of equal parts of fine silver and malleable brass is used, the mass being protected by borax. Soft silver solder differs from this only in the addition of 1-16 part tin.

Very fine and delicate articles are soldered either with pure gold or a gold solder composed, of 1 part gold, 2 parts silver, 3 parts copper.

FLOUR WITHOUT MILLSTONES.—Another device for making flour without the use of millstones is being put to a practical trial in England. The grain is crushed by one thousand little trip hammers attached to the proper machinery to produce the result desired. The machinery is said to be very cheap, doing up its work in a most scientific manner, and flour produced is said to be far superior to that obtained by grinding. A pounding mill costing one thousand dollars, will produce as much flour every day as an old-fashioned mill costing \$5,000. The new mill is very simple. When a hammer is out of order you can replace the same with a few cents. For four thousand years millers have produced flour by grinding the grain with stones. What will be the result of the modern attempts to do without grinding stones remains to be seen.

Concrete in London.

The London *Architect* has some pertinent observations on the uses of concrete for building purposes, from which we quote the following:

We are convinced that both for the sake of building cheaply and building well, we shall see before long a wonderful alteration in the mode of using bricks. We go on making the lumps of burnt clay we call bricks in the way we do, chiefly because it has been the fashion to make these lumps in some regular form ever since men began to build, although modern science has long ago pointed out to us much cheaper and better methods of employing both lime and clay.

A brick wall as it is put together now-a-days, with its multiplicity of small joints, and its liability to consist either of porous, underburnt bricks, or friable, loamy mortar, can hardly escape becoming saturated with moisture every wet day, and retaining for the longest possible period the water used in its construction. But why make bricks at all? We can burn the clay in heaps with small coal, and burn it thoroughly, to incipient vitrification, for one-third the cost that we can burn it in the form of bricks; and we can make the chalk mixed with clay into a water-resisting cement for very little more than the expense of converting it into lime.

There can be but little doubt that concrete, carefully made from these materials and cast into hollow blocks a twelvemonth before it is wanted, might be a cheaper material, and a better one in every way, than those we are now using. Constructed of such blocks as these, we might obtain substantial, damp-proof houses ready for occupation directly they were built, with the advantage of hollow walls, out of which the moisture had evaporated before they were put together.

Then, our plastering again; it seems hardly credible that we go on daubing our walls with the miserable, crumbling, rotten stuff generally used for the purpose, while the best material we have ever had, the "patent fibrous plaster," made in large slabs to screw against the quartering of battens, requires no laths, can be fixed by a carpenter in half the time of common plastering, perfectly dry, at a cost, battens and all included, less than ordinary three-coat plaster work.

Any invention of this kind has, however, to encounter a fearful amount of prejudice and dislike, and a process tending, as this did, to alter the practice of an entire branch of trade, has very little chance of success.

Houses need not necessarily be damp, and we could avoid this evil by altering our present mode of building. Any change in existing systems can, however, only be brought about by the most imperceptibly slow degrees, unless, indeed, some powerful and united action be induced, either by Government legislation, or by awakening the public to the sense of the evil of the present system.

ALLEGED IMPROVED ROTARY PUMPING ENGINE.—A large pumping engine has been more than three years at work at the lead mines of Bleiberg, near Aachen, in Rhenish Prussia, and as its economical results are highly satisfactory, it begins to be imitated in other mining districts. It is a Woolf compound engine, and was constructed at Seraing by M. Kraft, of that famous establishment. The peculiarity of this engine is that the steam cylinders do not act directly upon the pumps, but through a crank shaft with fly-wheel upon a balanced beam, to which the pump rod is attached in a parallelogram. The engine makes on an average 3½ strokes per minute, though it has been worked with ease 8½ strokes. The economy of coal is most remarkable with this engine, as it only requires 1.75 kilograms, or 3.85 lbs. (English) per hour, per effective horse power.

STEEL RAILS are still gaining in favor on first-class railroads. By the end of the present season the Chicago and Alton Railroad Company will have one-fourth of its road laid with steel, and it has contracted for enough to lay another quarter of the road by the end of the next season.

The Boston and Albany Railroad have also decided to substitute steel for iron rails upon the entire track of that road as fast as practicable. About 9,000 tons of steel rails have been purchased with this object in Europe, 4,000 tons of which will be delivered this year and 5,000 tons next year. They will be laid as fast as they are received.

NEW METHOD OF SECURING BOLTS.—Iron bolts in wooden structures are always attacked by rust, which diminishes their size and loosens their hold. A simple remedy is now discovered. Bolts are coated with a mixture of zinc filings and grease. The iron is thus galvanized and preserved from oxidation. It is a French invention.

A QUADRUPLE RAILROAD TRACK.—It is announced that the New York Central Railroad Company have decided to lay a new double track all the way between New York and Buffalo, making a quadruple track (of eight rails) between the two cities.

IRON SHIPS.—Some shipbuilders predict the failure of iron in ships, which will cause a revival in trade in wooden ships, and assert that iron vessels are always ready to sink when the heads of the iron rivets become corroded. That their decadence, when commenced, will be rapid.

Decay of Stone.

Dr. R. Angus Smith, of London, Eng., has observed that the particles of stone most liable to be in long contact with rain from town atmospheres, in England at least, were most subject to decay.

Believing the acid in the rain to be the cause, he supposed the endurance of a silicious stone might be measured by its resistance to acids. He proposed, therefore, to use stronger solutions, and thus to approach to the action of long periods of time. He tried a few specimens in this way, and with most promising results.

Pieces of stone of about one cubic inch in size were broken, by allowing a hammer to fall upon them, the number of blows required to produce fracture being counted. Similar pieces were steeped in dilute acid; both sulphuric and muriatic acid were tried, and the latter preferred. The number of blows now necessary was counted. Some sandstones gave way at once, and crumbled into powder, some resisted long. One very dense silicious stone was but little affected. It had stood on a bridge (in a country place, however) unaltered for centuries.

These trials are merely the beginnings of a very extensive set of experiments about to be undertaken by Dr. Angus Smith, with a view to establish a standard of comparison.

SCIENTIFIC PROGRESS.

The Evolution Theory.

In all that has been said in favor of the Darwinian doctrine of evolution it is claimed that no one has yet been bold enough to assail the position that "there is a distinction in kind between the mental faculties of man and those of the brute; and that in consequence of this distinction in kind, no gradual progress from the mental faculties of the one to those of the other can have taken place." James More, M. D., furnishes the *London Lancet* for July 27, 1872, with a paper upon this special point from which we condense as follows:

This specific distinction is nowhere more apparent than in the feelings and emotions. A very slight observation is sufficient to convince us that, though there is a close similarity, or even identity, in what may be called the physical or corporal feelings of man and the brute, still man stands alone in the possession of purely intellectual and moral emotions. It is in virtue of his animal or corporal organization that man possesses, like the brute, these grosser feelings; but it is in virtue of his self-consciousness that he possesses feelings and emotions which, in their expression, control the intelligence, guide the will and are in strict harmony with his religious nature.

We cannot but admit that the lower animals have feelings and emotions of a complex kind, which, besides entering largely into their mental life, produce much the same effect upon their bodily organization as the same feelings and emotions do on man. Terror acts in the same manner on them as on us, causing the muscles to tremble, the heart to palpitate, etc. They have suspicion, courage, fear, affection and other allied emotions; but on analyzing these feelings, we are bound to admit that they are, for the most part, of physical origin—in fact, that they are simply modes of instinctive consciousness.

When man is the subject of any kind of feeling he looks inwardly, into his own being, and not outwardly. Our emotions are purely subjective. On the other hand, the emotions of the lower animals are deficient in the subjective element. Like their higher instinctive and probably also their intellectual acts, their emotions are merely acts of objective consciousness. Their feelings are always related to some object, and can come into play only in the actual presence of that object. Their emotions have never any reference to any general notion or abstract idea, but merely to external objects of the senses.

This distinction—that of subjective in man and objective in the brute—our author holds to be a specific and important one, and places man in a position far above that of the brute—a position, which could not have been arrived at by the latter through millions of ages of evolutionism.

In the brute, the appetites, feelings, or emotions being under the influence and guidance of instinct, must be obeyed, and they are often obeyed contrary to the conditions under which they ought to be manifested. This is what is sometimes called blind instinct; it is simply the manifestation of any feeling or emotion apart from conscious intelligence.

An instance in point is given of a dog, which while enfeeling under the knife of his master, used for scientific purposes, licked the hand that gave him pain—thus showing a feeling of love apart from intelligence.

The brute is incapable of being actuated by mixed feelings or motives, one idea being always dominant and guiding their conduct.

In recapitulation our author finally says:—"We find that the feelings and emotions of man give him quite a distinctive character, and seem to exclude him from the scale of mere animal being."

1. The emotions in man are subjective, in the brute they are purely objective acts.

2. Man has intellectual, moral and corporal emotions, which may hold simple or complex relations, according as they are conditioned by consciousness or self-consciousness.

3. The brute has corporal emotions, which may hold simple or complex relations, according as they are conditioned by instinct or intelligence.

4. Man possesses emotions which have reference to his aesthetic or religious nature.

5. The feelings and the emotions of the brute, like the purely corporal emotions in man, have reference only to the preservation of the individual and continuation of the species.

6. The higher emotions of man hold very complex relations to the element of time, and place him in harmony with the past, present and future.

7. The emotions of the brute have reference only to the present.

8. The emotions of man are in strict harmony with his moral will. The emotions of the brute are in accord only with volition.

9. Certain emotions in man and animals become, under certain circumstances, dominant in the mind, conquering and replacing all other emotions and feelings.

10. Man can control or prevent his domination of feelings; the brute cannot.

11. The emotion or feeling of wonder is one of the most important in man, and, from its special relations to time and space, forms one of the most distinctive features in his mind. In the brute this feeling has no definite relation to time or space.

A Planet Between Mercury and the Sun.

It has for some time been suspected by astronomers that there was a small planet revolving about the sun, between that luminary and the orbit of Mercury, and with a period of revolution of about 20 days. This matter has been quite recently alluded to in *Nature*. In the *Scientific American* of Dec. 14th, Mr. J. R. Hind called especial attention to the subject and suggested that, on March 24th next, the sun's disk should be watched, as a conjunction of this hypothetical planet with the sun is expected to occur about 10 A. M. on that day.

In a subsequent number of the same paper, Mr. John H. Tice, an astronomer of St. Louis, Mo., writes as follows: In the latter half of September, 1859—I cannot now fix the exact date, though it may have been about the 20th—I saw the planet pass over the disk of the sun. I first saw it about 9 o'clock, my attention being called to it by some boys who were looking at the sun through a smoked glass. It was then on the eastern limb, and its apparent diameter was about 2½ inches. It took it about two hours to pass over the sun. As it is impossible for any of the known interior planets to pass over the sun in the month of September, it must have been an unknown planet. I communicated this fact to the naval professors in 1869, requesting that search be made for this interior planet at the eclipse of that year, but nothing was ascertained.

NEW THEORY OF CYCLONES.—An officer connected with the Spanish navy has published a new theory of cyclones, which is, at least, a very plausible one. He found his reasoning on the hypothesis that a zone of air, saturated with vapor and compressed by two opposite forces, requires a power of resistance peculiar to solid bodies, and may, therefore, be made to revolve like a disk. He applies this hypothesis to the typhoon of the Chinese Sea, and shows what is universally known, that there is a northeast trade wind and a southwest monsoon, and that between these two winds there exists in the Pacific a zone of calm which shifts its position in accordance with the prevailing wind—that is always on the side of the weaker one. Now, if these winds be oblique to each other and unequal, the zone will revolve, and, as it finds no obstacle to stop it, it will also be shifted more or less horizontally, which is the exact motion of cyclones.

SMOKING FLAMES.—M. Peaneth, says *Les Mondes*, has found that if a flame burning in the open air be approached to a vibratory tuning fork, the sound of the latter is considerably increased, as if it were placed in contact with the box of a stringed instrument. The sound acquires its greatest intensity when the flame is placed between the two branches of the fork. This phenomenon is believed to be analogous to the singing flame, only in such case it is the flame that excites the vibratory movement of the tube in order to place itself in similar synchronous vibrations; while, in the above mentioned instance, it is the fork that gives the tone and the flame takes up vibration in unison.

PLANT PHOSPHORESCENCE.—The Rev. M. J. Berkeley describes, in the *Gardener's Chronicle*, a very remarkable instance of luminosity in fungi. It occurred in the mycelium of an unknown species growing on a trunk of spruce or larch, and was as powerful as to make a perfect blaze of white light in the track where the trunk had been dragged, and vividly illuminating everything in contact with it. It gave almost light enough to read the time on the face of a watch, and continued for three days.

SCIENCE is studied by the observation of facts. But observation is not easy. It requires more memory and a further perspective than most men possess. Experiment, too, is necessary, which is a series of questions put to Nature, and no witness can be found more difficult to examine.

face. The mill is kept busy pounding out the gold while the water is plenty.

Idaho.—The Idaho is evidently getting ready to declare another dividend. A partial clean up—a sort of skimming of the amalgamators—after six days' run, gave \$18,000 worth of gold.

EUREKA.—Yesterday the amalgamators at the Eureka mill were cleaned up, after a 6 days' run with 10 stamps. The clean up does not include anything from the batteries. The result was about \$12,500 worth of gold. The rock now being put through the Eureka mill averages something like \$120 to the ton.

SAN BERNARDINO COUNTY.

NEW TIN MINE.—San Bernardino *Guardian*, Jan. 4: A new tin mine reported to be of wonderful richness was discovered about 3 months ago in a direction southeast of this place, distance about 12 miles. Experts pronounce it to be of the very best quality of tin ore, surpassing in richness any yet discovered in this county—and this is the only county in the State, we believe, that tin has yet been discovered in any great deposits. Messrs. Gass & Co. are the lucky discoverers of this mine, and for reasons, best known to themselves, we suppose, they have kept very reticent about this discovery, until recently. Mr. Harden Yager will take with him to San Francisco, in about two weeks, three or four hundred pounds of this ore for assay. We are anxious to see the returns from the assay, believing, from the representation made of its richness, that it will equal if not surpass our celebrated Temescal Tin Mine.

ORD DISTRICT.—During the past week ore brought in by Messrs. McCoy and Coburn from their lead in this district has been successfully smelted at Forney's blacksmith shop—the first successful attempt made here. In this case the pure metal—silver—was run out. The lead is unquestionably very rich.

AVA WATTS DISTRICT.—Mr. Sam Strong recently arrived from this district, bringing with him a ton of exceedingly rich ore which he confidently expects—from various tests—to yield \$3,000 per ton. Mr. S. has gone to Truckee for machinery which he has there, and intends at once, to forward to his mine. Mr. Horace Clark, also, has returned from Ivanpah laden with very rich ore—\$1,600.

SANTA CLARA COUNTY.

COAL.—Gilroy *Advocate*, Jan. 11: We learn that Henry Miller Esq., has discovered an extensive coal mine on his Los Animas grant, a few hundred yards south of the Pajaro bridge, and about 6 miles from this city. Mr. Jas. P. Sargent informs us that he burned some of the coal, and it is a superior article. Vast deposits are said to be imbedded in the range of hills that divide the Pajaro and San Benito rivers.

SIERRA COUNTY.

EMPIRE.—Downville *Messenger*, Jan. 11: This Co. are driving their tunnel as fast as 3 shifts can send it. This is a new unopened mine adjoining the Monumental, and no doubt is entertained of its being equal to any of the celebrated mines on the Blue Lead Range. The tunnel to open the mine is to be 2,900 ft., one-half of which is completed and the remainder being in soft rock; it is estimated that 10 months' time will be required to tap the channel.

MONUMENTAL.—This Co. is one of those established facts requiring no especial mention. The pay is uniform and the mine lasting. Each month brings its regular dividends. Some apparent new developments have recently been made in extending their main tunnel into the hill by finding pay dirt much farther back than any found by the adjoining claim.

HAWKEYE.—This Co. is one of those poor unfortunates which never draws a healthy breath—always sick and just dying—but never dies. This Co. has always had good dirt; but owing to a combination of circumstances, a large debt has accumulated and the mine is surrendered to the creditors to get their money if they can.

UNION.—This mine shows very cheering prospects. After running a long time to reach ground beyond and back of former workings, and the sudden flooding of the mine, requiring a long time and much expense to tap, the first new ground reached did not meet the expectations of one conversant with the mine, however, it soon was proved to be but a low depression or pot-hole, which as soon as passed, exposed as fine a body of gravel as is to be met with in any of the mines in that vicinity. The system of working the mine is very complete, and the cost of dirt in the dump is considerable less than in any mine yet worked in that vicinity. A crew of about 60 men are now employed and the force will soon be increased. Water is abundant for all purposes.

COMET.—This Co. in their sluicing mine have made a good year's run, and the showing is exceedingly good for a few years yet. They are now extending their tunnel to get their flume closer to the face, thereby enabling them to run dirt much faster than formerly.

GRAVEL MINES.—Grass Valley *Union*, Jan. 11: On the "Ridge" of Nevada county the miners are doing a land office business. At Forest City in Sierra county, the Bald Mountain Co. have had plenty of water for washing since the rain. For several successive days they took out about 140 ounces daily. The same thing is proportionally true of all the gold gravel claims in the country of gravel deposits. All of them are paying.

TUOLUMNE COUNTY.

SERENO GULCH.—Sonora *Independent*, Jan. 11: They have just cleaned up from a 2 weeks' run of 5 stamps, \$2,170. They are down 140 ft.

from the surface, and 35 ft. below the bottom tunnel where they are sinking and stopping in this level, and thus far into the hanging vein about 10 ft. The mine on the upper level shows a vein of 18 ft. The boys say that the gold is thick in the rock, and we have no doubt from present indications that it will turn out one of the finest mines in the State. They are at present running 10 stamps.

CITY MINING.—Loomard & Hart have commenced operations in view to mining the "Clark lot," purchased by them some time ago. They have dug a deep drain under the street gutter to drain off the water, which will also afford sufficient fall for sluices.

Nevada.

LANDER COUNTY.

COY HILL.—Eureka *Sentinel*, Jan. 8: The Paul Jones, who has been thoroughly prospected, than any other mine belonging to the Co., is now turning out some of the richest ore ever found in this district, or, in fact, in any portion of Eastern Nevada. Blasts were put in recently, throwing out large masses of ore, permeated with veins of crystallized horn silver, which were in some cases from one-sixteenth to one-eighth of an inch in thickness. From all indications, a large body of very rich ore is a subject of antiquity, with appearance of being a permanent vein. In order to obtain an average assay of the ore, a sample of the dust taken from a drill-hole was assayed, and yielded \$2,333 per ton in silver. An average specimen of rock from the vein of ore containing horn silver, went \$2,754 per ton. A large amount of second and third-class ore, varying in value from \$100 to \$1,000 per ton, is found in the mine, a quantity of which will be worked at the Phoenix Smelting Works within a few days.

DIAMOND DISTRICT.—Jan. 10: Some interests in loading mines have been lately transferred to parties who mean business; as the Bamboo Nos. 1 and 2, and Grant Mining Companies' claims. The extension on the Champion will also be prospected in the spring. The ore of Diamond district is a subject of antiquity, with a large proportion of galena. It assays very high in silver. The Banner mine belongs to a San Francisco company, who devote one-half of their stock to a fund for working capital. The mine is on the same hill with the Champion, Bamboo and Grant, and hears the same quality of ore.

SUNNY VALLEY DISTRICT.—Several series of mines in this locality having passed into the hands of the Lander Mill and Mining Company, a number of them are now being developed rapidly. Working results from the ore show a yield of \$150, \$200, and as high as \$3,000 in some instances. Much of the ore contains very little base metal. It must, however, be roasted previous to milling.

SECRET CANON DISTRICT.—Considerable prospecting is going on in this district, particularly in the Geddes & Bertrand and Hoscoe mines. The latter is in litigation, but the owners in possession still take out ore and have it smelted at the Phoenix works. The ore is a granulated sulphuret of lead, with some antimony. It is worked from the shafts, which have reached a deposit occupying the entire space. The deepest shaft is 50 ft. Yield of the ore by smelting from \$40 to \$150 in silver. The Hoscoe mine is a subject of antiquity, and the consequence of the suit with Eureka Co. The Lookout mine shows the largest body of ore ever discovered in the district. The Phoenix Co. have lately struck a good body of paying ore in one of their mines. The Excelsior mine, belonging to the Silver West Con. Co., will be tapped by a tunnel below their present works, and beneath the body of ore in sight. The Fourth-of-July Tunnel is nearly completed. The two latter mines are on Prospect Mountain. The Valentine and Byron, near by, belonging to the Ruby Con., are being rapidly developed. The Dandenberg, on Home Ticket Hill, belonging to the Ruby Con., is now worked from a deep shaft. The Home Ticket Co. are still actively engaged in developing their mine. The entire hill on which they are located is a network of mineral veins and deposits. The Ruby Hill Tunnel has reached a length of 308 ft., with indications of a near approach to ore. A new contract has recently been let on this tunnel, and the work is going on as briskly as possible.

The Lemon Tunnel is now in 480 ft., and the face is within 40 ft. of the ore deposit. The ore of the Lemon mine is of a higher grade, and very fine for milling. The Coy Hill mines have been rich, and are growing richer. The result of the latest assay of rock from the Paul Jones, taken from the depth of 25 ft. only, showed a yield of \$2,835.56 per ton. At and near this point the vein matter averages 1 1/2 ft. A specimen lies on our table, with a coating of horn silver as thick as a case-knife blade. Another piece we saw has a thick coating of soft horn silver that may be cut with the finger-nail, and melts in the flame of a candle like the candle itself. It is owned by only two persons, one of whom is G. W. Kinney, late of Mining Recorder.

ELY DISTRICT.

CHARTER OAK.—Pioche *Record*, Jan. 5: Sinking the shaft to the depth of 100 ft., running a drift from that point and now sinking a winze on the ledge. Fine ore is being taken out every day.

GREY EAGLE AND SETTING SUN CON.—Working constantly, and have attained a depth of 125 ft. The work has all been concentrated on the Grey Eagle. Some 20 odd tons of ore lie on the dump, which assays from \$200 to \$300 per ton. The Setting Sun has a shaft sunk 75 ft., and looks well.

POOHE.—Still drifting from the bottom of the shaft. As yet not much has been struck, but it is expected to present itself every day. Four tons of ore are being hoisted daily from other portions of the mine, which produces rich results. The Magnet Mill is kept steadily at work on the ores of this mine.

PORTLAND.—The work is being vigorously pushed; 60 tons of first-class is now on the dump; some of the same class was milled and pulped \$200 to the ton. The shaft is 100 ft. in depth. A winze from this level has reached a depth of 45 ft. The ledge shows well, being of a rich decomposed yellow chloride. The ledge in this winze is 2 to 3 1/2 ft. in width. There is about \$25,000 in the treasury at present.

EXCELSIOR.—Drifting is now being done to connect the winzes. The ore shows in this drift as far as worked, and is very rich. On the Excelsior dump 275 tons of rich ore awaits crushing. The quantity and quality of the ore is amazing.

MEADOW VALLEY.—No. 3 of this mine has a depth of 620 ft. at the 7th level. Sinking at this point and taking out ore. No. 5 is 430 ft. deep. No. 7 is 750 ft. deep and still sinking. The bulk of the ore comes from No. 3 and some from No. 7.

RAYMOND & ELY.—Depth of the Lighter shaft to the 7th level, 623 ft. vertical depth. The 7th level is just being opened, and a fine ledge is showing splendidly. Twelve hundred tons of 3d-class ore lies on dump and about 1,000 tons of good ore at the mill.

SILVER PEAK.—Running drift west from the bottom of the incline. Taking out a little ore all the time.

GREY AND BISHOP.—The depth of this mine is about 250 ft. The vein has been in sight the entire depths, and specks of ore of a very rich character can be seen throughout.

WASHINGTON COBLE.—The incline has attained a depth of 600 ft. The prospects look flattering.

MAZEPPA.—Jan. 8: An important strike has been made in this mine. At the depth of 160 ft. in a drift connecting the new works with the old shaft the ledge has been struck, and stopping has been commenced. The ore body varies in thickness from 20 to 30 inches and is of the first quality, assaying from \$200 to \$3,000 per ton.

HUMBOLDT.

BOLIVIA DISTRICT.—Unionville *Silver State*, Jan. 11: It is reported that an English Co. is negotiating for the purchase of the Baker copper mine. The mine is developed by a shaft 75 ft. in depth, and the ore carries a high percentage of copper.

CENTRAL DISTRICT.—Mullen & Co.'s mill is running steadily on samples of ore from different ledges in the district. A lot of crude bullion from the mill, the result of a few days' run on Boulder ore, was melted and assayed this week. The bar weighed 70 ounces, the assayed value of which was \$465, practically gold.

GOLD RUN DISTRICT.—A rich strike in the Manette mine is reported. Goldendans claim that the ore is richer in silver than any ever found in quantity in the State.

MILLS RUNNING.—The Pioneer mill is running on ore from the Humber and the Arizona and Silver mill on ore from the Arizona. The Arizona is producing more ore in proportion to the number of miners employed than at any time during the summer.

BUTTE MILL.—We learn that this Butte mill at Ite Patch, which has been shut down for 2 or 3 weeks, started up again last Monday.

LAST CHANCE.—After a long search the owners of this mine have succeeded in finding the main ledge, which is 3 ft. wide and contains exceedingly rich ore. The ore, extracted from spurs and stringers encountered in searching for the ledge has been sufficient to pay all expenses incurred. Several lots of ore shipped, yielded from \$200 to \$300 per ton.

TALLAH.—W. T. Burns and L. B. Brackett have leased the Tallah, in Dun Glen, for 6 months. We understand they intend to commence work on the mine next week.

DE SOTO.—Nine and a half tons of first-class shipping ore was shipped from the De Soto mine to San Francisco this week.

REESA RIVER.

BULLION.—Reesa River *Reveille*, Jan. 6: The bullion shipped by the Manhattan Co. for 1872 consisted of 670 bars, weighing 66,300 lbs. of the value of \$895,847.35. This the product of the 'ore from the Reesa River District mines, and may be taken as a fair result of one 20 stamp mill only.

OREGON.—Jan. 11: The ore house is full of good ore. ISABELLA.—This mine is leased to 4 companies, taking out good ore.

SARATOGA.—This mine is always doing well, and taking out the very best kind of ore; the ore house contains 50 tons of \$400 ore.

GROVE'S TUNNEL.—Turning out large quantities of good ore, milled, results reserved.

FREEHOLD.—Some \$100 ore is being taken from the upper level. The ledge is large.

S. O. BAKER.—Taking out good ore.

MORGAN & MUNCEY.—The ledge has been struck, and good ore found.

YANKEE BLADE.—Maggie.—Some rich sulphuret ore has been milled, results reserved.

KLING & KELLEY.—Taking out large quantities of ore.

HARTFELD TUNNEL.—Prospects are very flattering, and somewhat ore is being extracted; there are probably ten tons now in the ore house of good grade.

BELMONT CO.—The Canfield mine has an incline down 264 ft. The first level is 75 ft. down. The level is open and 30 ft. north, and shows some of the best bodies of good ore, which are held in reserve. A 4 ft. further down is the second level—at the water line; it is opened 210 ft. southerly and 616 ft. northerly. It was a fine sight to look at the fine breast of chlorides along the level nearly the entire length from the incline northward. The lower level is now run southerly 135 ft., and northerly 220 ft. Several patches of very good ore are exposed in each of these drifts.

WASHOE.

MILLS ON THE CARSON RIVER.—Gold Hill *News*, Jan. 10: We have this last 3 days, says the *Enterprise*, nearly 40,000 lbs. of ties and as much as 150 ft. level. The Savage, Vivian, Mexican and Brunswick mills, on the Carson River, and work is being executed in a lively manner. The Eureka Mill crushes from 20 to 22 car-loads of Belcher ore per day, 7 1/2 tons being the average weight of the car-loads. The Santiago Mill, running on Belcher ore, also, manages to crush 10 car-loads per day, and nearly all the other mills are in active operation.

BELCHER.—Jan. 11: Daily yield 330 tons, from the 1000 and 1100-ft. levels. The incline is still sinking at a good rate of progress, and is 33 ft. below the 1200-ft. level. The drift from this station north is in 42 ft., and the main drift south at the 1200-ft. level to meet it is in 250 ft. from the Crown Point line; the face is splendid ore. The south drift to connect the 1100 and 1200-ft. levels, 200 ft. south of the Crown Point line, is probably about completed, as the connection between the winzes and raise was expected to be made this afternoon. The main drift east from this incline, at the 1100-ft. level, is in 286 ft., and the north drift at the 850-ft. level is in 393 ft. A neat little engine of 8 or 10 horse-power has arrived and will be put to work to connect the 1100 and 1200-ft. levels, at the head of the south winze spoken of at the 1100-ft. level. It is to be worked by compressed air.

SIERRA NEVADA.—Daily yield, 45 tons of good milling ore. The different ore breasts are looking and yielding well, as usual. The mill and hoisting works are receiving the addition of two new tubular hoilers, 50 inches in diameter and 16 ft. long; also new car-roads and other machinery.

SAVAGE.—Daily yield 140 tons of ore, worth \$28 per ton. The incline is making excellent progress, the rock in the bottom working much softer than at our last report; it is down 135 ft. below the 1000-ft. level. The main shaft drift on the 1000-ft. level is pushed steadily ahead. The drift on the 1100-ft. level, in which assays are obtained as high as \$17 per ton, 700 much water at the 1500 ft. level to allow of proceeding at present.

OVERMAN.—The water in the shaft has been at last drained, after 16 days' incessant application, during which time 40,000 gallons per hour was hoisted from the shaft, making the total amount of 15,360,000 gallons. The shaft has been resumed in the main drift, it being found necessary to clean it out and retimber it in places where the ground was soft.

CROWN POINT.—The ore breasts all look well as usual; both ore and bullion yield highly satisfactory. The main incline is down 161 ft. below the 1300-ft. level, and good progress is being made. The 1300-ft. level is working better than ever, and the cross-cut east from the east winze, shows low grade ore in the face, with no sign of the east wall as yet. The assays from this level average over \$150 to the ton.

YELLOW JACKET.—Nothing new in the drift or cross-cutting at the 1300-ft. level north. The 1400-ft. level drift east into the ledge about 63 ft. It has developed a fine body of quartz drift ore, in which assays are obtained as high as \$17 per ton. 700 much water at the 1500 ft. level to allow of proceeding at present.

CHOLLAR POTOL.—Daily yield 110 tons, the assay of which is \$38 per ton. The prospecting drift at the first station has made connection with the old Potol shaft. The north drift at the 3d station is in 100 ft.

ISLAND.—The incline is down 97 ft. below the old tunnel level, making a depth reached of about 350 ft. from the surface. The upper side of the shaft is still in \$20 to \$25 ore, while the under side is, cutting the east wall. The ledge at this depth pitches strongly to the west.

CON. VIRGINIA.—Sinking the shaft is making progress. The main north drift on the 1,500-ft. level, from the Gould & Curry shaft is pushed ahead, the rock in the face being much softer.

GOULD & CURRY.—The incline is down 110 ft. below the 1,600-ft. level. The main south drift on the 1,600-ft. level is pushed ahead to connect with the north drift on the same level from the Savage.

HALL & NORCROSS.—The north winze on the 1,500-ft. level to connect with the 1,500 is down 146 ft.

MINZ.—December 28th an assay of the ore gave \$88.89 in gold, and \$271.50 in silver; January 4th, \$140.57 in gold and \$378.90 in silver, showing a decided increase in the value.

IMPERIAL EMPIRE.—The surface work for the new pumping machinery is completed.

SILVER HILL.—Both the north and south drifts at the first station are still driven.

RED JACKET.—Machinery and pump being put in position for an active resumption of work in the mine. The incline is now 75 ft. deep, and shows a fine 6 ft. ledge.

JULIA.—Sinking the shaft is making good progress. The drift on the 700-ft. level is in 42 ft. Prospects favorable at all points of the mine.

BUCKEYE.—The new ore body developed south of the incline is turning out finely and both mills kept steadily running.

KENTUCK.—Still yielding the usual quantity of good ore from the old workings about the 500 and 600-ft. levels.

TAH.—All work in the mine suspended for the present on account of inability to obtain wood and timbers.

KNECHTERBROCK.—Main west drift in 437 ft.; face in clay, with some water, indicating ledge near by.

BEICHER.—Virginia *Chronicle*, Jan. 9: The Bank of California received today several bars of bullion from the Belcher mine, amounting in the aggregate to \$38,000. Added to the amount received yesterday from the same source, makes \$30,000 received in two days from this mine.

EUREKA MILL.—Virginia *Enterprise*, Jan. 7: During the month of December the Eureka mill turned out from Belcher ore 5,000 tons of bullion. The average value is \$30 per ton, making a total of \$300,000, or nearly enough to pay the dividend recently declared by the Belcher Mining Company.

Colorado.

GRAND ISLAND DISTRICT.

CARBON.—Central City *Register*, Jan. 8: The west half gives employment to 60 men. The east half employs 30 men, and is producing an average of 25 tons of ore per day.

SHERMAN.—The main shaft is 40 ft. deep and still going down. The main level 40 ft. in length, is being stopped. The first-class ore yields from \$300 to \$600 per ton, the second from \$100 to \$250; and the third is sold to Fred & Carter for \$50 per ton. A recent estimate shows the mine to be paying at the rate of \$150 per week for every man employed.

SEVEN-THIRTY.—The main shaft is 75 ft. deep, from which a level is being driven eastward. It is now 130 ft. in length; 35 tons of rich ore are piled up on the surface, of which the first-class nets \$1,000 per ton, the second 350 ounces.

EXTENSION.—This ledge has a shaft 50 ft. deep, and ore worth 530 ounces silver per ton.

ONTARIO.—Has obtained the depth of 90 ft., and is sending out ore which yields seven hundred ounces of silver per ton.

HAWASSA.—It is a late and very rich discovery, located something like half a mile north-east of Cardinal. At the depth of 20 ft., 30 inches of solid mineral is exposed. The *Enterprise*, Jan. 6: This silver mine at Phillipsburg has been sold to a Pennsylvania Co. for \$500,000. This mine has been harassed by long and complicated litigation. The title has been settled at last, and extensive operations are to be commenced at once.

Idaho.

CHALLENGE.—Owyhee *Avantader*, Jan. 4: This new mine begins where the original Mahogany, consisting of 800 ft. in length, ends on the south.

MAHOGANY.—The 6th level drift in this mine is now in 240 ft. south of the shaft, showing a rich vein over 18 ft. wide. The winze for the 7th level is down 75 ft., and the sinking 25 ft. more, this level will be started south in which direction the rich ore has been shown from the surface downward. In the bottom of this 7th level winze the ledge is 3 ft. 4 inches wide and exceedingly rich. The main shaft is now down 70 ft. for the 7th level, in fine looking ore. The Cosmos Mill is steadily running on Mahogany ore and turning out plenty of bullion.

BULLION.—W. F. & Co. shipped from here during the 2 weeks ending yesterday, 20 bars of bullion, valued at \$35,833.46.

SOUTH CHARLOT MILL.—We are informed that this mill will be started up next week and run steadily on South Charlot and Red Jacket ore.

Montana.

CLAUDEVILLE DISTRICT.—Montanian, Jan. 2: The mines of this district are being worked with great energy and success. The Legal Tender has been developed to a considerable extent, establishing beyond a question its permanence and value. It has been found that the Legal Tender for \$400,000. There are several other lodes in the vicinity believed to be quite as good as the Legal Tender, which are being developed as rapidly as possible. This camp alone could produce a thousand tons of ore for shipment per day that would pay large returns; if railroad construction were open south.

PARK CITY.—Helen *Herald*, Dec. 26: At the Park the ground is literally honey-combed by industrious prospectors. A shaft 100 ft. deep has just been completed on the Choctaw ledge, and steam hoisting works have been erected.

Oregon.

QUARTZ MINES.—Oregonian, Jan. 4: At the assay office of J. H. Fish, we were shown recently specimens of quartz rock recently taken from the Summit Lode Mine, at the foot of Mt. Hood, in the Cascade Range, near the Eastern Oregon, Union county, and are owned principally by J. H. Packwood. The lode has been definitely prospected for a distance of 1,000 ft., and this mine is now ready for active operations. A shaft has been sunk a distance of 150 ft., and large quantities of rock have been taken out. About \$25,000 has been realized so far from these mines. The rock is quite rich in gold, and will average \$30 per ton. Mr. Packwood proposes to go to California soon and incorporate a company for the purpose of working these mines, and also to place the stock on the market.

Utah.

STAR DISTRICT.—Utah *Mining Journal*, Jan. 8: The late sale of the Old Hickory made things lively in the camp; everybody is at work. This Hattie is still working out of the old shaft, and the ledge has been struck in a new place, being a vein of rich, hard ore, about 2 ft. wide, that will work \$300 to the ton.

It is announced that a rich strike has been made in the Wellington, and that a large amount of ore is already on the dump. Last night 1,500 shares were telegraphed for by different parties here to the San Francisco Board; \$20,000 has been offered for the ore on the dump, and it will be brought to the city as soon as the roads are in condition. The strike is the richest that has yet been made.

We are reliably informed that pure chloride for horn silver was struck yesterday in one of Winsor Co.'s mines, Little Cottonwood. We did not learn the extent of the strike, only that a large body had been encountered.

CORRECTION.—In our list of mining, incinerations, in the issue of the MINING AND SCIENTIFIC PRESS of the 4th inst., we gave that of the "Mountain Co." It should have been as follows:

MONTEUR M. AND M. CO.—Dec. 31. Location: California, Nevada, Oregon and elsewhere. Trustees—W. A. Darling, J. C. Boyd, J. Brodie, T. P. Reynolds and E. W. Hause.

Resources of Utah.

We continue the articles under this head from the Salt Lake Tribune.

The Germania Separating and Refining Works.

The object of these works is to separate from the impure lead bullion the precious metals which it contains, as well as its impurities, and to effect this on the spot where the bullion is produced, and thus save the expense of shipping worthless matter at great cost to points far distant.

The works are situated on the west side of the U. S. R. R., about eight miles from Salt Lake City, and were commenced nearly six months ago, and although not yet completed, are now in operation and producing about forty tons of desilverized or marketable lead daily.

The Buildings

Are extensive, substantial, and arranged with a view to economy of labor and convenience in manipulation. They consist of the main building, or furnace house, refining house, assay office, engine house and all necessary offices and out-houses, together with manager's and superintendent's dwellings. In the furnace building are five large cast-iron pots, set in substantial brick work, each one over its furnace or fire place, two reverberatory softening furnaces, two calciners, and two flowing furnaces. Connected with this building is the engine house, containing a fine forty-five horse power engine, and a fifty-five horse power boiler. A little to the north of this is an inclined shaft furnace, while to the west of the works, at a distance of a few rods is a substantial brick stack, which is connected with the furnaces by means of underground flues of strong masonry. A side track is laid from the main track to the works, by means of which all the materials employed are brought to their respective destinations without trans-shipment.

The process which is here used for separating the lead and silver is that known as

Flach's Process,

With some additions and improvements made by Mr. Sieger, the superintendent of the establishment.

The following description will give some idea of the

Modus Operandi.

About 23 or 23½ tons of base bullion, as received from the different smelting works are put into one of the largest of the pots, which are five in number, two of them having a capacity of 25 tons each, the other three being smaller; the whole number being set in the form of a wedge, the two largest forming the broad part, while the smallest pot forms the point. A sharp heat is kept up until the impure lead is thoroughly melted, and sufficiently hot to melt the zinc (which is the medium of separation) immediately on its addition, or at a temperature of about 411 degs. Celsius, the melting point of zinc. Zinc is employed for the separation of gold, silver and copper from lead, owing to its possessing a greater chemical affinity for these metals than that of lead. The zinc employed at this establishment is of two kinds, viz., commercial or good zinc, and dross zinc (a refuse matter from galvanic batteries) which contains about 30 per cent. of iron. The former is obtained from Illinois at a cost of 9 cents per pound, and the latter from New York at a cost of 5 cents per pound. When the base bullion is tolerably free from impurities and contains from 150 to 200 oz. of silver per ton, 2¼ to 2½ per cent. of zinc, or 3 to 3½ per cent. of dross zinc suffices for its complete desilverization.

As soon as the metal has attained the requisite heat, from ¾ to 1 per cent. of zinc, or from ½ to 1½ per cent. of zinc dross is added to the molten mass, which is well stirred by two men for half an hour, and then allowed to remain still for three hours. Immediately after stirring, the fire is withdrawn from under the pot, and the metal allowed to cool to a dull red heat. The zinc being thoroughly mixed with the lead; takes up the gold and copper, with the greater portion of the silver, and rises to the surface, forming a scum or cake which gradually covers the whole of the lead.

The object of adding a portion and not the whole of the zinc at one time, is to avoid the caking of the zinc on the surface of the metallic bath, whereby it would not be in a state of division sufficiently fine to mix thoroughly with the lead.

At the expiration of three hours this scum is skimmed off and transferred to the pot next in advance. The whole operation, from the commencement to this point, occupies about four hours, but varies with the amount of the impurities in the lead. A second addition of zinc is now made in the proportion of ¾ to ¾ per cent. of zinc, or 1 to 1½ per cent. of zinc dross.

The dross or scum in the second or advanced pot, after being melted, stirred, and allowed to cool, is skimmed and the skimmings transferred to the 3d, or end pot of the series, the alloyed lead and zinc containing a little silver which has separated from the dross being moved back to No. 1. This is effected by means of an iron gutter leading from the rim of one pot to that of the other, into which the lead is ladled. A similar process is then performed with pot No. 3. The dross being skimmed off and transferred to a receptacle called the "safe," and the separated alloy of lead and zinc carried back. The remainder of the zinc having been added to pot No. 1, it is again stirred and skimmed, the skimmings being put aside for a further operation.

This lead running in pot No. 1. is now prac-

tically free from gold, silver and copper, but is rendered a little hard by a portion of the zinc remaining in it, together with a little antimony, of which, if there is much in the base bullion, a small percentage remains.

At the bottom of the large pot is a pipe connected with an iron gutter leading to the hearth of a reverberatory softening furnace, which is placed at a lower level than that of the pots, to avoid the necessity of moving the lead by hand.

These furnaces, of which there is two, one for each large pot, are 15 feet 6 inches long and 9 feet 4 inches wide, internal dimensions, with a hearth or bed of sufficient depth to contain the contents of the large pot. The bed of this furnace is composed of a large iron pan cast in three pieces and having the bottom flat and gradually curving to meet the upright sides and ends. This is covered with fire clay, and over the clay with fire brick set on end. When well put together these parts will last for years. The furnaces has only one fire grate, placed at the end. These furnaces are built upon arches, which serve to keep the bottom cool, in order to more easily remove any lead which through bad setting may trickle through. The furnace having been raised to the requisite temperature, the lead pot is tapped and the metal allowed to flow into the furnace. The heat is then kept up and a portion of the zinc and antimony is oxidized and escapes in the form of fume, while the remainder forms a scum which rises to the surface and covers the bath of lead. The lead is well rabbled from time to time with iron rakes, in order to expose a fresh surface to the air, and this is continued until the lead shows, by samples taken from the furnace, that it is pure and ready for tapping.

At a distance of a few feet from the end of the furnace is another pot, called the market pot, the level of its rim being a little below that of the hearth of the furnace, and into this the lead, after being skimmed, is allowed to flow through an iron gutter.

The moulds, which are on wheels, having been run under this pot, the lead is admitted into them by means of a tap which stops the supply as each mold is filled.

These bars of lead are made to weigh about one hundred and forty pounds each; and, when cool, are taken out and ready for shipment. They are now wheeled up an incline, but it is intended to have a raised tramway over the tapping place, on to which small wagons containing the bars are to be hoisted, and run direct to the side track. This lead is now pure, containing, on an average, not more than half a pwt. of silver to the ton, and being free from gold, copper and all impurities, and is fit for any of the purposes for which lead is applied, either for making white or red lead, sheet or pipe.

The loss in this furnace is very trifling, not amounting to more than one-half per cent. because the molten lead is almost continually covered with a crust of zinc, etc.

The whole operation, from the loading of the first pot to the tapping of the market lead, occupies twenty-four hours, and at the present time the capacity of these works is

40 Tons per Day.

So that each twenty-four hours, about 90 per cent. of the bullion operated upon is returned as pure marketable lead.

The dross obtained from the last skimming of No. 1 pot is transferred to a flat-bedded calcining or roasting furnace, of which there are two in the main building, one for treating the pot skimmings, the other for the skimmings from the reverberatory furnace. It is here thoroughly roasted at a temperature insufficient to soften it, so as to get rid of any remaining zinc or antimony, and when sufficiently roasted is then put in the flowing furnace, where the lead is separated from the iron and other matters which form a slag which is worthless. The lead is tapped and returned to No. 1 pot, with a fresh charge of bullion, when the same routine is again gone through. The flowing furnace is very similar to the reverberatory softening furnace, differing only in the form and material of the furnace bed. The calciners, before mentioned, have each two grates, with a flue rising from the center of the furnace. The object of the two grates is to obtain a much higher degree of heat when necessary for the refractory or very impure skimmings.

The same process is gone through with the skimmings from the softening furnace. The next point is the treatment of the rich alloy from pot No. 3, which was placed in the "safe." This is taken to the shaft furnace before mentioned, and which will be now described.

Description of Shaft Furnaces.

It is an inclined shaft furnace with the back sloping towards the front, at a little distance above the tuyeres the front recedes more abruptly from the back. The internal dimensions are, from breast to back two feet seven inches, and from side to side two feet six inches. It has three tuyeres having a diameter of only 1½ inches, and a pressure of blast equal to about 24 inches of water, or one pound upon the square inch. This blast is produced by a blowing cylinder, 24 inches in diameter, and having a 24-inch stroke. The blast passes into a chest or reservoir, and is thence conducted by pipes to the furnace.

The fuel used is coke (that in all the other furnaces, with the exception of the crucible furnace, being Vandyke coal) which is obtained from Pittsburg, and costs, delivered at the works about \$28 per ton.

The Fluxes

Used are Hematite iron ore, which is obtained from Rawlins, and costs about \$15 per ton, delivered, and a little lead-slag, of which plenty can be had in the neighborhood; the charge is composed as follows: Rich alloy, 250 lbs.; iron ore, 180 lbs.; Coke, 55 lbs.; and a little lead-slag. After a good heat has been raised in the furnace, the charging is commenced; the coke is first thrown in and spread evenly over the surface. The rich alloy is then charged, being all fed against the front of the furnace, the iron-ore and lead-slag are then thrown in and mixed together, and spread evenly over the furnace, three of these charges are worked in one hour, so that about sixteen thousand pounds of alloy are passed through this furnace in twenty-four hours. The heat is maintained so low that the furnace at the feed-door is perfectly black and quite cool; the only flame visible being a small reducing flame running up the inside of the front of the furnace. Owing to the peculiar construction of the furnace, the charge gradually sinks and meets the sudden incline, from whence the alloy passes down to the zone of fusion, in the center of the furnace, without touching the walls, and is not melted until when within a few inches of the tuyeres. By this process the copper is obtained by matte, and the gold, silver and lead in the form of a highly-enriched lead. This rich alloy is tapped off about once in every hour and a quarter, and the slag about every five minutes. This slag is received in cast-iron pots, where it is allowed to solidify before being turned out. This slag is almost entirely free from lead, and contains only a trace of silver, so that practically it may be considered clean. The bars of silver are now taken to the cupelling furnace. This is in appearance not unlike a very short reverberatory furnace with a very large grate; but instead of the usual bed are a couple of bars, on which is supported the cupel, or, as it is usually called, the "test."

The Test

Consists of an elliptical frame of wrought iron, filled in with bone-ash well beaten and hollowed out in the requisite shape by means of special tools for that purpose. At the back of the furnace are two holes, one where the blast pipe enters, and the other for introducing the rich bars into the test. The test, which is placed with its long axis towards the blast, is left a little thicker at the opposite end, where the litharge flows over. When the test has been raised to a good heat, a sufficient quantity of the rich lead is introduced, and the whole speedily melts, and the blast is now turned on. The oxygen of the air composing the blast, oxidizes the lead into litharge, and this takes up all foreign metals. A portion of the litharge is absorbed by the test, but much the larger quantity flows over the end of the test furthest from the blast, and is received in iron pots mounted on wheels, which are moved as fast as filled. The rich lead is continually added, until all has been oxidized, and the silver is now pure, containing only the gold in the bullion. If, however, there should happen to have been more copper in the enriched alloy than could be carried off by the lead contained in it (which is shown by the appearance of greenish spots floating on the silver), this can be easily removed by the addition of a little more pure lead to the test.

Immediately on the termination of the cupellation, a very beautiful phenomenon is seen, which is termed the "brightening." Just as the last trace of lead clears from the silver a peculiarly bright and vivid flash seems to cover the whole bath of metallic silver, and for an instant every brick in the arch of the furnace is reflected as plainly as in a mirror.

A series of ingot moulds set in a frame are then run under the test, and a hole bored into the bottom of the test, through which all the silver runs into the moulds.

These ingots are now taken to the crucible-house, and about thirty-five pounds weight put into a plumbago crucible and melted. A little charcoal is thrown into the crucible, and the whole stirred with a stick. After skimming off the coal and any little slag which may have formed, the metal is poured into ingot moulds of the requisite size, and the silver, which is now fine, is after assay stamped with its degree of fineness.

This finishes the whole operation, as the gold and silver are not separated at these works, but sold as an alloy.

Owing to the fact that all these operations are not proceeding at one and the same time, the number of men employed is comparatively small (being only thirty-five), when the large amount of work done comes to be considered.

Cost of the Works, Etc.

These works have been erected, not only with a view to convenience, but also to economy, the whole establishment, together with the purchase of the land (twenty-five acres), having cost not more than fifty-eight thousand dollars. It may be remarked here, that the total loss of lead in all these operations does not amount to more than 2½ per cent.

Ore Sampling Works.

These works were brought into existence from a want of some means of equitable arrangement between the seller and buyer of ores; as no two samples made by different interests would agree, with any accuracy, thereby causing mutual distrust and delay, each believing his own sample to be the correct one.

The first public sampling place was started by Geo. I. Johnson, Esq., of Boston, in the California corral, on Second South street, Salt Lake City, where the sampling was performed by

hand, no machinery being at that time erected. Ore, in lots of five tons and upwards, was brought to the corral and sampled, purchase or refusal being at the option of the sampler.

Howland's Mill.

These were the first complete sampling works erected in the Territory, and are situated at the corner of the block due south of the U. C. R. R. Depot, and contain an engine of twenty horse power, which communicates motion to a "Howland Crusher and a Burr stone mill." The whole of the machinery, together with a spacious sampling floor and private office being under one roof. This mill was erected by Messrs. S. W. Howland & Co., of San Francisco, in the winter of 1870, and was by them sold about the fall of 1871, to W. T. Richmond, Esq., of Chicago, who is the present owner. During the last summer it was leased by R. Macintosh, Esq., of this city, who now carries on the business.

Salt Lake City Sampling Mill.

This mill is situated on the west side of the U. S. Railroad track at the corner of 4th South and 3d West streets, and was built in June, 1871, by Geo. J. Johnson, Esq., who formed a business partnership with Messrs. James Lewis & Son of Liverpool, the firm assuming the name of Lewis, Johnson & Co. The machinery consists of a fifteen horse power high pressure engine by J. O. Hoadley of Boston, a Brodie crusher and a French burr-stone mill. The building, which is under one roof, consists of a spacious sampling floor 60x40 feet, an engine room, private office, assay office and laboratory. Since last summer the business has been carried on by Mr. Johnson alone. This mill has a sidetrack from the U. S. R. R., and spacious platforms for the reception of ores.

H. S. Jacobs & Co.'s Sampling Works,

Are situated one block north of the above, and on the eastern side of the railroad, with a side track for loading and unloading ores. The machinery consists of a very finely finished stationary engine and a Dodge crusher. The sampling floor, engine room and office are in one and the same building. These works were erected in June, 1871, by H. S. Jacobs & Co., of Pennsylvania, and during the early part of last summer passed into the hands of Messrs. Baxter & Co., who converted them into amalgamation works, having erected two pans with the usual attendant machinery.

At Sandy Station,

Messrs. Gordon and Murray and Messrs. Durant & Cutting connect with their forwarding business the sampling of ores and bullion.

Method of Sampling.

In sampling rich milling ores the whole bulk is usually crushed; but with poor milling ores, galena and copper ores, one-fifth of the bulk is generally operated upon. The ore, after having been crushed, is thoroughly mixed and spread out evenly on the sampling floor. It is then by a succession of what is termed "quarterings," reduced to a bulk of about two bushels. This is further pulverized by hand with "buckers" on an iron plate, until it will all pass through a one-eighth inch sieve. This is again thoroughly mixed and reduced by repeated quarterings to about the quantity of sample required by the buyers and sellers; say sufficient to fill four 4-ounce sample bottles.

The pulverized ore is now reduced either in a mortar or by "bucking" irons, to a state of division fine enough to enable it to pass through a sieve containing from fifty to sixty meshes to a linear inch. The sample is again thoroughly mixed and put into the bottles, which are sealed and labeled with the number of sacks, weight of ore, date of sampling and of sale. Owing to the great difficulty experienced in perfectly cleaning the burr-stone mills, they had to be abandoned, as it was found almost impossible to remove the whole of the previous sample, the fine particles of which lodged in the joints, etc., of the machine, thereby being liable to cause serious error, by portions of a previously crushed rich sample becoming mixed with a succeeding poor one, and vice versa.

COMB MANUFACTURE.—An English journal states that the greatest comb manufactory in the world is in Aberdeen, Scotland. There are thirty-six furnaces for preparing horns and tortoise-shell for combs, and no less than one hundred and twenty iron screw presses are continually going in stamping them. Steam-power is employed to cut the combs. The coarse combs are stamped or cut out, two being cut in one piece at a time. The fine dressing combs are cut by fine saws, some as fine as to cut forty teeth in the space of one inch, and revolving five thousand times in the space of one minute. There are some two thousand varieties of combs made, and the aggregate number produced, of all these different kinds, is 8,000,000 annually—a quantity that if laid together lengthwise would extend about seven hundred miles. The annual consumption of ox-horns is about 730,000, and the annual consumption of hoofs amounts to 4,000; the consumption of tortoise-shell and buffalo-horn, although not so large, is correspondingly valuable. A hoof undergoes eleven distinct operations before it becomes a finished comb.

PREMIUMS FOR DEVELOPMENT.—The Virginia Enterprise makes the suggestion to the Legislature of Nevada, to offer a bonus of \$10,000 to the man or company that produces the first one hundred tons of coal, and the same amount for the first one hundred flasks of quicksilver produced in Nevada; which, it says, is meeting with general approval by the press and people of that State.

USEFUL INFORMATION.

Luck.

It is the shallow who believe in luck; who say of a successful man, "he always was lucky," or of an unsuccessful one, "Poor fellow, just his luck." A man's luck is generally the measure of his capacity and perseverance. Chance produces effect, the world over. Water does not run up hill, nor do we gather, even in these days of progress, grapes of thorns, or figs of thistles. If we would gather golden grain, we must first sow the seed. If we would be wise we must work for wisdom. Riches, goodness, fame, love—each has its price and can be purchased for no loss. Life is a perpetual auction, where all prizes are knocked down to the highest bidder. The world's great men have been those who have toiled early and late. Even genius can find no royal road to its goal. Goethe, and Milton, and Newton, labored as the easy-going, fine gentlemen of literature cannot conceive. If they were great, they achieved greatness—it was not thrust upon them. Luck is ever waiting for something to turn up. Labor, with keen eyes and strong will, will turn up something. Luck lies in bed, and wishes the postman would bring him news of a legacy; labor turns out at six o'clock, and with a hussy pen or ringing hammer, lays the foundation of a competency. Luck whines; labor whistles. Luck relies on chances; labor, on character. Luck slips down to indigence; labor strikes upward for independence.—N. Y. Evening Telegram.

FORCE OF WIND.—It is seldom that a more striking instance of the great force which may be exerted by wind, is witnessed than was observed in the recent hurricane, which swept over the island of Sicily. It is said that no earthquake ever caused so much destruction. There are houses ruined, houses fallen on the ground, walls cleft from end to end, walls hanging outward as if to rest on the adjoining houses; there are roofs wholly swept away, sunken vaults, balconies torn from their places. Not a single house remains in which the whole roof and windows do not require thorough repairs. The streets are a mass of fragments and rubbish.

The iron bars of a balcony are to be seen curled up one way, those of another twisted up another way. There is a pillar of a palace which has been moved forward one foot without breaking, and stands up isolated all in one piece. There is a wall of another palace which has fallen back more than three feet without a crack. Here is a beam of one house which has thrust itself into another house. There is half of a bedstead the other half of which lies no one knows where. All the tiles of one building were huddled together in one spot on the roof, crushed and broken up as small as if they had been pounded.

HOW THE CHINESE BUILD.—In China when a contractor engages to build a house, he encloses the premises and sets up cooking apparatus to supply his hired workmen with regular meals at the most economical rates. Having taken breakfast, they work until noon, rest one hour, and leave off at 5 p. m., and return to their homes. On leaving, each takes a ticket which admits him next morning. These tickets are daily vouchers of the artisan's presence. Counted up at any time a true account is rendered. A man on the ground throws several bricks to another ten feet above, and he to another still higher. Thus the masons are supplied as they ascend with the wall. Instead of carrying mortar in a hod, it is thrown by the shovel full from one story to another to any required elevation, without spilling a particle, so expert are they by continued practice.

WHAT SHALL A WORKMAN STUDY?—In "Lectures in a Workshop," in the *Industrial Monthly*, T. P. P. says: If there is any doubt about what study or studies should be followed with a view to self culture, we can remove it by a simple rule given in these words namely: *Study your business.* By this the daily bread is to be earned; and it is highly probable that the knowledge of the trade engaged in exceeds the information on all subjects outside of it. Many men are continually attempting too much, and worry because they can not swallow whole volumes of literature and science in a few months; they are apt to slight their daily occupation as an unavoidable means of maintenance, and concentrate their efforts upon something foreign to their trade. Such men have mistaken their calling, and are wasting their time so far as self-improvement goes.

A BEAUTIFUL FRENCH ART.—A French chemist proposes a new and unique method of coloring artificial flowers. He selects colors of different tints, soluble in water, and mixes them with a clean mucilaginous gum, and then pours this out upon highly polished square glass tablets of several inches in diameter. The layer is put on uniformly, and the tablets exposed for a time to a well-heated stove. The gummy mucilage dries rapidly into a thin, polished plate, which afterward separates from the glass and falls off. It may then be reduced to a powder of any required fineness, the result obtained being remarkable for its transparency and permanency. The sheets thus obtained with aniline colors are considered especially beautiful.

HOW THEY WERE WOUNDED.—A German newspaper presents the following interesting facts with regard to the apparent efficiency of the different weapons employed by the combatants in the Prusso-French war:—

Out of 3,453 Germans wounded around Metz, ninety-five and a half per cent. were injured by the Chassepot rifle, two and seven-tenths per cent. by the artillery, and only eight-tenths per cent. by cold steel.

Among the French wounded twenty-five per cent. were wounded by the German artillery, seventy per cent. by small arms, and five per cent. by cold steel.

These figures themselves tell a very remarkable story.

The same paper pretends that in the whole course of the war twenty-five thousand French were hit by the German artillery, so that, on comparing the number of wounded with the number of shots fired, the conclusion is inevitable, that for every three discharges of a German cannon at least one Frenchman was killed or more or less injured.

According to the statistics of the German wounded, the following proportion has been established in an official manner:

Ninety per cent. of men were hit among the infantry; five per cent. in the cavalry; three per cent. in the artillery; and two per cent. in all the other branches of the service.

As these results have been confirmed by every course of investigation made up to the present time, they establish what had been previously asserted—first, that the Chassepot rifle is superior to a needle gun Dreyse fusil; second, that the breech-loading German artillery is superior to the muzzle-loading French.

The second proposition has never been questioned, viz., the overwhelming superiority of the German batteries.

PROGRESS OF THE MANUFACTURING INTERESTS. At the Engine Builders' Convention lately held at Cincinnati, General Leggett said: "Manufacturing as it now exists in this country, is the development of the last thirty or forty years. Forty years ago, there was a blacksmith and shoe-maker in every school district, and at every cross-road all over the land. The blacksmith made horse shoes and nails, plow points, hoes, shovels, pitch forks, hinges and latches, nearly all of the builders' hardware, and much of the cutlery used. Then he was a manufacturer—his own employer and employee. Now, farmers' tools, builders' hardware, and household utensils are made in large establishments, and the village and country blacksmith have become mere tinkers, and do little more than mend or repair. The cross-roads shoemakers have degenerated into cobblers, only making an occasional pair of boots or shoes to accommodate deformed feet, not provided for in dealers' cases. Nearly all our boots and shoes are made in immense factories—some single establishments turning out over six thousand finished pairs a day. The same is true of almost every department of manufacturing.

BROWN TINT FOR IRON AND STEEL.—Dissolve in four parts of water, two parts of crystallized chloride of iron, two parts of chloride of antimony, and warm the brass over the flames of a Bunsen burner or a spirit lamp, and plunge it while hot into nitric acid for two or three seconds. Then return it to the flame, and heat it till it blackens, brush off blisters, and lacquer. Another way is to use a liquid containing two parts of arsenious acid, four parts of hydrochloric acid, and one part of sulphuric acid in eighty parts of water.

Zinc may also be given a fine black color by cleaning the surface with sand and sulphuric acid, and immersing for an instant in a solution composed of four parts of sulphate of nickel and ammonia in forty of water, acidulated with one part of sulphuric acid, washing and drying. The black coating adheres firmly, and takes a bronze color under the burnisher.

NEW USES FOR SOLUBLE GLASS.—The employment of soluble glass, in the chemical and industrial arts, is constantly increasing, and its value is now fully established. Recently, a cement of great hardness and various applicability has been produced by mixing different bases with this singular substance. It is found that, combined with fine chalk and thoroughly stirred, it will produce a hard cement in the course of six or eight hours; with fine sulphide of antimony, a black mass is produced which can be polished with agate, and then possesses a superb metallic lustre. Fine iron dust gives a gray-black cement. Zinc dust produces a gray mass exceedingly hard, with a brilliant metallic lustre, so that broken or defective zinc castings can be mended and restored.

GOLD IN SEA-WATER.—Careful experiments made upon water taken at different times from Ramsey Bay, Isle of Wight, show that seawater contains about one grain of gold to each ton of water. It is held in solution as a chloride. The presence of eliver in the ocean in still larger quantities has long been known.

TRANSPARENT SOAP is made by thoroughly drying soap cut in thin shavings in an oven, then pulverizing and dissolving it in high-proof alcohol, and finally distilling off the latter till the soap will solidify into cakes.

BLACK AND WHITE.—Experiment proves that white letters on a black board are seen at a longer distance and always more clearly than black letters on a white board.

GOOD HEALTH.

Strength and Health.

It is quite a common idea that health keeps pace with strength. I know intelligent persons who really think that you may determine the comparative health of a company of men by measuring their arms—that he whose arm measures twelve inches is twice as healthy as one who measures but six. This strange and thoughtless misapprehension has given rise to nearly all the mistakes thus far made in the physical culture movement. I have a friend who can lift nine hundred pounds and yet is an habitual sufferer from torpid liver, rheumatism and low spirits. There are many similar cases. The cartmen of our cities, who are the strongest men, are far from the healthiest class, as physicians will testify. On the contrary, I have many friends who would stagger under three hundred pounds that are in capital trim. But I need not elaborate a matter so familiar to physicians and other observing people.

No test of health would prove more faulty than a tape line or a lift at the scale beam. Suppose two brothers—bank clerks—in bad health. They are measured around the arm. Each marks exactly ten inches. They try the scale beam. The bar rises at exactly three hundred pounds with each. Both seek health. John goes to the gymnasium, lifts heavy dumb bells and kegs of nails until he can put up one hundred and twenty-five pounds and lift nine hundred, and his arm reaches fifteen inches. Thomas goes to the mountains, fishes, hunts, spends delightful hours with the young ladies, and plays cricket. Upon measuring his arm we find it scarcely larger than when he left town, while he can't put up sixty pounds nor lift five hundred. But who doubts Thomas will return to the bank counter the better man of the two? John should be the better man if strength is the principal or most essential condition of health.

A circus usually contains among its performers a man who can lift a cannon weighing nearly or quite half a ton. Then there is a half a dozen riders and vaulters, who have comparatively little strength. If any one supposes that the strong man has better health than the flexible, elastic ones, he has but to make inquiries of circus managers, as I have done, and he will learn that the balance is found almost uniformly with the latter. Agility and flexibility are far more important than strength, and that fine silken quality of the muscular fibre, which comes only from an infinite repetition of light and ever varying feats, is far more important than size.—*Dio Lewis*, in "To-Day."

Pneumonia.

Pneumonia is an inflammation of the lungs attended with fever. Sometimes the fever is of the diathesis termed inflammatory, and sometimes of the low diathesis to which the term typhoid is applied. In either case the chief trouble and danger wholly consist (aside from treatment) in engorgement of the lungs. They are so congested with accumulated blood that breathing is laborious, the cough severe and distressing, and the expectoration difficult. The fever may be mild or violent. But in all cases the essential point in the treatment is to relieve the overloaded vessels of the lungs. This is to be done, not by taking the blood out, nor blistering the skin, nor poisoning the stomach, but simply by determining the circulation from the lungs to other parts of the body, and freeing the whole mass of blood of its effete and viscid matters. And all this can be accomplished by balancing the temperature steadily at or near the normal condition standard. In a day or two, sometimes in a few hours, and in the worst cases within a week, the patient will be fairly convalescent.

The structure of the lungs being spongy and elastic so as to allow all the blood in the body to pass through them once in three minutes, enables them to bear an immense degree of engorgement without disorganization.

The psin in the lungs may be very severe, the cough extremely violent, the breathing exceedingly distressing, the fever intense and the patient utterly prostrated, with no danger of dying, providing nothing is done amiss, for the excretory organs are gradually casting out the impurities from the whole mass of blood and the myriads of little glands in the lungs themselves are unloading the congested vessels by the process of expectoration, so that in due time the trouble is removed and the patient (not the disease) is cured.

In order to maintain the balance of circulation so that "nature" can perform her remedial work successfully, the surface must be frequently bathed with water of a temperature suited to the circumstances of each case, the rule being, the warmer the surface or any part of it, the cooler the water, and vice versa.—*Science of Health.*

SUBSTITUTE FOR QUININE.—It is said that the Brazilian doctors now use the juice of the famous Eucalyptus plant as a substitute for quinine, and with astonishing success; in fact it threatens to supersede the famous febrifuge. When Eucalypti are planted no fever of any kind appears. There can be no stronger stimulus to push on the culture of this beautiful and swift growing tree in this country.

The Man of Long Life.

He has a proper and well-proportioned stature, without, however, being too tall. He is rather of the middle size, and somewhat thick set. His complexion is not too florid; st any rate, too much ruddiness in youth is seldom a sign of longevity. His hair approaches rather to the fair than the black; his skin is strong, but not too rough. His head is not too big; he has large veins at the extremities, and his shoulders are rather round than flat. His neck is not too long; his abdomen does not project; and his hands are large, but not too deeply cleft. His foot is rather thick than long; and his legs are firm and round. He has also a broad, arched chest, a strong voice, and the faculty of retaining his breath for a long time without difficulty. In general there is a complete harmony in all parts. His senses are good, but not too delicate; his pulse is slow and regular.

His stomach is excellent, his appetite good, and his digestion easy. The joys of the table are to him of importance; they tune his mind to serenity, and his soul partakes in the pleasure which they communicate. He does not eat merely for the pleasure of eating, but each meal is an hour of daily festivity; a kind of delight, attended with this advantage, in regard to others, that it does not make him poorer, but richer. He eats slowly, and has not too much thirst. Too great thirst is always a sign of rapid self-consumption.

In general, he is serene, loquacious, active, susceptible of joy, love and hope; but insensible to the impressions of hatred, anger and avarice. His passions never become too violent or destructive. If he ever gives way to anger, he experiences rather a useful glow of warmth, an artificial and gentle fever without an overflow of the bile. He is fond also of employment, particularly calm meditation and agreeable speculations, is an optimist, a friend to nature and domestic felicity, has no thirst after honors or riches, and banishes all thoughts of to-morrow.

HYGIENIC NOTES — REMEDY FOR PAINFUL WOUNDS.—The enclosed is excellent, and ought to be published once a year. I found it in a paper sometime ago, and have tried it and can recommend it from experience: Take a pan or shovel with burning coals, and sprinkle upon them common brown sugar, and hold the wounded part in the smoke. In a few minutes the pain will be allayed, and recovery proceeds rapidly. In my case, a rusty nail had made a bad wound in the bottom of my foot. The pain and nervous irritation was severe. This was all removed by holding it in the smoke for fifteen minutes, and I was able to resume my reading in comfort. We have often recommended it to others with like results. Last week, one of my men had a finger-nail torn out by a pair of ice-tongs. It became very painful, as was to have been expected. Held in sugar-smoke for twenty minutes, the pain ceased, and promised speedy recovery.—*Rural New Yorker.*

DIETETIC HINTS.—Most chronic diseases, and many acute ones, are produced at the table. As a rule, no food of any kind should be taken at the table, especially if the stomach is weak. The stomach should never be overloaded, not more than two or three articles should be taken at one meal; no stimulants used before eating; tobacco arrests digestion. Milk is the best diet for infants and children. Tomatoes with cream and sugar are healthy and nutritious. Bread and butter is the staff of life, and easily digested. Too much salt irritates the stomach. Colds are frequently produced by drinking hot tea and exposure afterwards. Late suppers induce heart disease. Pastry and cakes constipate the bowels. Boiled potatoes are not as healthy as baked ones. Fruits are to be eaten at breakfast and dinner. The stomach requires much rest to be healthy; purgative medicines weaken the bowels. Cheerful conversation promotes digestion; anger prevents it.

CURE FOR THE OPIUM HABIT.—In a recent report on the condition of the English hospital at Peking, China, the attending physician gives a formula for "anti-opium pills." This remedy is composed of extract of henbane, extract of gentian, camphor, quinine, cayenne pepper, ginger and cinnamon, with castile soap and syrup to form the coating. The efficacy of these pills in overcoming the opium habit, and in preventing the suffering on giving up the use of that poison, is stated to have been proved in numerous cases. The native remedies, it is said, contain opium in some form, and meet frequently the ashes of opium already smoked, and consequently are inefficacious—it being as difficult to discontinue the use of the medicine as of the drug itself.

AMMONIA FOR WHOOPING COUGH.—Since it has been shown that the inhalation of air changed with the vapors of ammonia are beneficial in cases of whooping cough, M. Groutham, of Paris, has been experimenting on the effects of boiling strong ammonia in the room where the patient was, with decided success.

FRUIT AND INTEMPERANCE.—A medical writer remarks that he has never known a person decidedly fond of fruit who became intemperate; and he considers the two tastes as naturally antagonistic.

B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, ORO. E. BROWNE,
W. B. EWER, JNO. L. BOOZE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

Table of Contents.

GENERAL EDITORIALS.—Management of Incorporated Mining Companies; Coal Lands; A New California Invention—King's Burglar Alarm, 40. The Polytechnic Course of Lectures, 41. One Gold and Silver Product, 44. **ILLUSTRATIONS.**—Vertical Section of a Quartz Mine; View of Placer Mining, 33. Fish Culture; The Hoe Four-Cylinder Press, 41.

CORRESPONDENCE.—Japanese Mines and Minerals Again; "The Ancient Channels;" The Sulphur Banks of Lake County, 34.

MECHANICAL PROGRESS.—The Use of Zinc: Soldering Iron and Steel; Flour Without Millstones; Concrete in London; Alleged Improved Rotary Pumping Engine; Deceit of stone, 35.

SCIENTIFIC PROGRESS.—The Evolution Theory; A Planet Between Mercury and the Sun; New Theory of Cyclones, 35.

USEFUL INFORMATION.—Luck: Force of Wind; How the Chinese Build; What Shall a Workman Study; A Beautiful French Art; How They Were Wounded; Progress of the Manufacturing Interests; Brown Tint for Iron and Steel; New Uses for Soluble Glass, 39.

GOOD HEALTH.—Strength and Health; Pneumonia; Substitute for Quinine; The men of Long Life; Hygienic Notes; Dietetic Hints; Cure for the Opium Habit, 39.

MINING SUMMARY from various counties in California, Nevada, Colorado, Idaho, Montana, Oregon and Utah, 37. Market Report, 44.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Meetings; Meetings and Dividends; Review of Stock Market for the week, 38.

MISCELLANEOUS.—Resources of Utah; Comb Manufacture, 36. Laws Under the New Code, 42. Patents and Inventions; Copper Faced Type; Meetings and Elections, 44.

A NEW YEAR'S GIFT.—The Pioneer (woman's journal), makes mention of a pleasant little affair which recently happened in our office, which we hesitated to make notice of. Mr. McCarty is one of our most efficient agents, and appreciating his services, it gives us pleasure to be able to insert the following:

We like to see newspaper men rewarded on this earth, as it is not at all probable that heaven will confer upon them its choicest blessings. We are swelled with pride, then, to know that that genial and urbane gentleman, L. P. McCarty, agent and traveling correspondent of the *MINING PRESS* and other journals published by Dewey & Co., of this city, has been the recipient from the proprietors, of a heavy gold chain and a beautiful gold locket with quartz setting, as a New Year's present. Mr. McCarty well deserves this generous appreciation. His host of friends will be glad to learn that he has been so handsomely done for. By the way, will none of the angelic lady spirits take pity on Mc and marry him. It's an unspeakable agony to see such healthy bachelors running around wild with nobody to sew on their buttons or broomstick them."

A NEW FIRE ESCAPE.—We were present to witness the operation of a new "Fire Escape," in front of the Occidental Hotel on Wednesday. We did not learn who the inventor is, or but little in relation to it. It was evident however that with the aid of a line or cord and an exceedingly small apparatus, which we did not get the chance of examining, that a person can let him or herself down from any height of windows with safety and dispatch, requiring less than two minutes to open the window, attach the rope and descend safely to the ground. We shall probably notice it further.

A BANKRUPT MINING COMPANY.—The South Gulch Gravel Mining Company has filed a petition in bankruptcy, praying that the company get the benefit of the Insolvent Act. The debts are \$1,083.67 and no assets. The property and privileges, in Calaveras county, were sold by the Sheriff in August, 1872, and all the interest the company have, is the right of redemption.

Management of Incorporated Mining Companies.

In our issue of the 28th ult., we published an article in which brief allusion was made to the manner in which a few unscrupulous men had completely monopolized the control of the mining interests of this coast, and how, for years, by virtue of their positions as trustees of nearly all our prominent mining companies, they had continued their nefarious practices, plundering without the slightest sense of shame, or shadow of remorse, everyone outside of their own clique, whom by any means they could induce to invest their hard-earned dollars in worthless mining stocks, or on some swindling scheme, gotten up for the sole purpose of fleecing the unwary. To those who have not long resided among us, or even to old Californians who have held aloof from mining speculations, and are consequently ignorant of the dishonest tricks these men have recourse to, some of our remarks may appear a little harsh, or unnecessarily severe. They cannot imagine how such men could long be tolerated in the community, and in their innocence suppose that the strong arm of the law would be stretched forth to check them in their career, and mete out that punishment they so richly merit. We know, however, that instead of the striped suit of the felon, that they dress in purple and finelinen, and fare sumptuously every day.

It is only reasonable to suppose that there must be an end to all this kind of thing; the victims will lose patience as well as money; the supply of greenhorns will fail or they will no longer be in a position to come up with their regular assessments. We much fear that unless some vigorous and decisive measures are speedily adopted, a crisis is inevitable which will result in the abandonment of some of our most promising mining districts, and the financial ruin of the State of Nevada. Time was when the well-to-do farmer or mechanic, wealthy merchant or real estate owner, was not afraid to invest a little of his surplus cash in mines; he considered the speculation entirely legitimate and went in in good faith, looking forward to the time when his dividends should return him a handsome interest on the money invested by him. How very few of such men ever received a dollar in the shape of dividends. They waited patiently, year after year, paid thousands of dollars in the way of assessments, and at last having become wearied and disgusted at the manner in which their property was mismanaged, they sold out, sadder, and poorer men; of course they were intimate with the President of the company and some of the trustees, and they could depend on them; they would always be well posted, etc., etc.

It is the old story; they found that their money instead of being judiciously expended in the purchase of machinery and on the development required by the mine, was used to secure the re-election of the old corrupt board of trustees, and squandered by fast superintendents. In the present age we find that money is all powerful, and the possessors of it can do many things with impunity which, a few years ago would have banished them forever from the society of honest men.

But a few weeks ago one of our leading mining speculators, whose name was prominently connected with the diamond swindle, was being examined by a special committee appointed for that purpose; he stated that "it was not the intention of the promoters of that enterprise to do anything on their grounds, until spring; that they required time to raise the funds necessary to secure the legislation they desired," etc. In other words to buy the United States Senate and Congress. No doubt the gentleman who was testifying knew what he was talking about. He had been on the Comstock since 1859, and he knew exactly what it cost to secure a decision, in his day, from a Washoe District Judge.

All these things are working sadly against our prosperity as a mining community, and unless some radical reforms are speedily effected in our mining laws, and in the management of our incorporated companies, the mines on the Pacific coast, with the exception of those held by English capitalists, will be entirely controlled by a few corrupt California stock speculators. When outsiders no longer invest their money, there will be but little left for the brokers to do, and the small fry which now eke out a precarious livelihood selling wild-cat on

the curbstone will have to look out for honest employment.

Whether some modification of the English mining laws, as they exist in Australia, and which work so admirably in that country, cannot be successfully applied here, or not, is a question well worthy the attention of our lawmakers. They certainly are not opposed in any way to the republican institutions of this country, and afford equal protection to the rights of the miner, and the capitalist.

Coal Lands.

A correspondent writes us as follows: "As you are pretty good authority on mining matters, I take the liberty of asking you the following questions: If I find a coal vein in ground belonging to another party, can I take the ledge up, or can I claim any portion of it for the right of discovery?"

Both queries may be answered by the familiar maxim, "*Cuius est solum est usque ad Caelum, et usque ad Orcum*," the free translation of which is: He to whom property belongs, holds the absolute right on the same to Heaven and to Hell. The right to mine for precious metals can only be exercised upon public lands, and, as a general rule the public mineral lands of the State are open to the occupancy of every person, who in good faith, chooses to enter upon them for the purpose of mining. The same rule applies to coal lands. If title has passed out of the government, and the lands have become the vested property of a private person, or private persons, no right of entry for mining purposes can be made without the consent of the owner.

There are two statutes relating to the manner in which coal lands may be obtained in this State. The first is entitled, "an Act for the disposal of coal lands, and of town property in the public domain," approved by Congress, July 1st, 1864. The provisions therein relating to coal lands is as follows: "That where any tracts, embracing coal beds or coal fields, constituting portions of the public domain, and which as mines are excluded from pre-emption by the act of 1841, and which under past legislation are not liable to ordinary private entry, it shall and may be lawful for the President to cause such tracts, in suitable legal subdivisions, to be offered at public sale to the highest bidder, after notice of less than three months at a minimum price of \$20 per acre; and any lands not thus disposed of shall thereafter be liable to private entry at said minimum."

The second statute is entitled, "an Act supplemental to the Act approved July 1st, 1864, for the disposal of coal lands, etc.," and provides with regard to coal lands as follows: "That in case any citizen of the United States, who at the passage of this Act, may be in the business of bona fide actual coal mining on the public lands, except on lands reserved by the President of the United States for public uses for purposes of commerce, such citizen upon making proof satisfactory to the Register and Receiver to that effect, shall have the right to enter, according to legal subdivisions, a quantity of land not exceeding 160 acres to embrace his improvements and mining premises, at the minimum price of \$20 per acre, fixed in the coal and town property Act of July 1st, 1864," provided, that when mining improvements and premises are on land surveyed at the passage of this Act, a sworn declaratory statement, descriptive of the tract and premises, showing also the extent and character of the improvements, shall be filed within six months from date of this Act; and proof and payment shall be made within one year from date of entry filing; but where such mining premises may be on lands hereafter to be surveyed, such declaratory statement shall be filed within three months from the return to the district Land Office of the official township plat; and proof and payment shall be made within one year from the date of such filing."

This is a supplemental Act to Act of 1864, enacted by Congress and approved March 3d, 1865. Said Acts of 1864 and 1865 are the only ones relating to the mode of taking up coal beds or coal fields. The provisions speak for themselves. They are of a special nature and very imperfectly define or give rights to discoverers of coal beds or lands at the present time. An Act was introduced at the last session of Congress to cover all the present defects and to make ample provision for those desiring to mine for coal. The bill failed to pass but another attempt is to be made at the present session of Congress. The queries made by our correspondent may be answered by the direct negative "No."

A New California Invention — Kane's Burglar Alarm.

We had the pleasure of seeing this week a new California invention, which is the best of its kind we have ever seen. It is called Kane's Flash-Light Burglar Alarm. The machinery is simple in its mechanism, and of superior finish, being encased in cabinet-work of black walnut. It is designed to be placed in a front window of the second story of warehouses, stores, factories, etc., to prevent its being tampered with, and in the halls of private dwellings, and is connected by wires with the doors, windows and other means of ingress, which are fastened by a simple movement, and can be thrown off at pleasure. When a burglar attempts to enter, the connecting wire is necessarily moved, which throws off the starting-har of the alarm works, and the machinery being thus operated, rings a very loud alarm, two hammers striking the gong; at the same time a flash-light is struck, which communicates with a steady light in front of a powerful reflector, thus indicating to the police or watchman, the building entered. The light alone serves to illuminate private dwellings, and saves the trouble of striking a light in the confusion and excitement caused by the discovery of burglars. Connection can also be made from a dwelling to a stable, thereby protecting horses, etc.

The machine is very simple in its mechanism, no electric battery being used. A connection on the door or window operates a bell crank, which has a wire connecting with the alarm box. The box contains a large gong, which would up will ring 1,000 strokes. When the machine is set in motion by the spring set loose by the wire, a hammer like that on a gun explodes a cap, which ignites a fuse connected with a candle and lights it. Behind this candle is a powerful reflector which illuminates the premises. The cutting of the connecting wire produces the same effect as a pressure against it—something which has never been accomplished by any other alarm. It is set at night when the family retire by a simple movement of the band, and if the windows or doors are opened the wires set the mechanism in motion. Chief of Police Crowley recommends it as one of the best inventions of its kind. It was patented by James J. Kane, of this State, and may be seen at Linforth, Kellogg & Co.'s, Nos. 3 and 5 Front street. The apparatus is really worth examining, as an ingenious and simple piece of mechanism, if for no other reason.

THE EXERCISOR PUMPS.—The attention of our readers has frequently been called to these pumps, which are conspicuous among the great numbers in the market as cheap and effective ones. The ship pump, a representation of which will be found in our advertising columns, is now being made in Philadelphia and has been adopted in Messrs. Cramp and Sons' large new iron ships; by Hussey, Jones & Co., Wilmington, Delaware; and the Philadelphia and Redding Railroad Company which contemplates building 80 iron ships and have already built two, have adopted it; and also use it wherever necessary on their road. The other styles are being rapidly introduced throughout the Middle and Western States for manufacturing and domestic purposes. The best engineers and mechanics in the East pronounce it unqualifiedly the best pump for hand purposes in the world. It is much used in mining and prospecting enterprises.

MORE TIN.—We frequently hear of tin discoveries on this coast, but repeated failures have taught people to be cautious how they accept the assertions of ignorant people as to richness and extent of deposits. The Utah tin excitement a year or so ago was the last of any prominence, and it proved to be an excitement and nothing more. We hear now through the San Bernardino *Guardian* of the discovery of a new tin mine about 12 miles southeast of that place. The *Guardian* says that "experts" pronounce it to be of the very best quality of tin ore, surpassing in richness any yet discovered in that county. If tin of any extent exists at all in the State it will probably be found in San Bernardino county, as there are mines there now, but we have yet to hear of any large fortunes being made from them. A really good tin mine would be of immense value to the State and we hope some day that some of these discoveries will be developed in a manner to prove their value.

BULLION.—There are 18,000 bars of bullion at Cerro Gordo, Swansea and Cartago awaiting shipment. Some 12,000 bars have been shipped by steamer across the lake to Cartago. The bullion is valued at \$600,000. These shipments used to come to this city via Los Angeles.

The Chronicle's Lightning Press.

As we are always interested in any mechanical improvements on this coast, and especially when they are connected with the "art preservative," we give place in this issue to a representation of the Hoe four-cylinder press which has recently been purchased for the San Francisco Chronicle. These presses are designed for the publication of large editions and fast daily newspaper work, and are a marvel of mechanical skill. Although complicated and extensive the press in question ran as smoothly and well when first erected as it does at present. The Chronicle describes the press as follows:

"In the center is a large iron cylinder upon which the type is placed, the 'turtles,' each of which is a segment of a circle, the type being fitted snugly and securely in their places. These 'turtles' hold the type in place after the forms are made up and are placed in the plane made for them on the cylinder. On each side of the central cylinder are two smaller ones, and over each of these the 'feed-boards' are placed, the lower ends almost touching the cylinder. On these boards the paper is laid and the four feeders take their places and pass each sheet to the press. On starting, the great central cylinder revolves rapidly, carrying the types from one to another of the small cylinders each of which meets it with a spotless sheet of paper, which receives the impression and is borne away on a perfect net work of tapes and laid on a board at the end of the press. Four sets of rollers for inking the type are placed in such a manner that immediately after one impression is taken, the forms pass under the rollers and receive a fresh supply of ink before coming in contact with the next cylinder. Altogether the improvements in the Chronicle have cost about \$40,000, as far as actual outlay is concerned, but general improvement in the whole paper have cost far more than that in the expenditure of energy, perseverance and time."

The Chronicle, our enterprising cotemporary, well known as the "live paper," a few weeks since moved its quarters from the building next door to the editorial rooms of the MINING AND SCIENTIFIC PRESS to the one opposite, which extends through from Clay to Commercial. The establishment is now the most complete in all its departments on the coast. The editorial rooms are neatly furnished, the composing room light and well ventilated and the press and folding rooms convenient and commodious. The most prominent improvement, however, is the new press, which is supplied with all the late improvements. It covers a space of thirty-three feet in length by sixteen in height and fourteen in breadth. There are over 60,000 separate pieces in the machine, and the total weight is 14 tons.

The young proprietors (Messrs. Do Young) were not long ago "boys" in moderate circumstances and deserve great praise for their indefatigable efforts to build up the institution which they founded. The circulation of the Chronicle has rapidly increased, and its late grand improvements will doubtless give it a new impetus and increased favor with the wide-awake public.

SUGAR SUPPLIES OF THE WORLD.—The constantly increasing demand for engare, a demand which more than keeps pace with the growth of population, is constantly calling for new sources of supply. In this regard the cultivation of Beet Root in California becomes most important. In many countries of Europe the home market is entirely supplied from this source. Austria which thirty-five years ago imported all her sugars now not only supplies herself but exports largely, and some towns in North Germany and France are entirely supported by the beet root sugar manufacture. But we are not entirely dependent on beets, for the Chinese sugar grass will grow all over the State, and there is no doubt that with irrigation the sugar cane will thrive in Los Angeles and San Bernardino. We hope before many years to see California noted as one of the sugar producing countries of the world.

Fish Culture.

Within the last six years a great deal has been said and written on the subject of fish culture, and widely extended and very successful experiments have been made resulting in establishing the fact, that where conditions are favorable, that an acre of water will yield as much profit to the owners from the sale of fish, as is usually derived from an acre of land cultivated to grains or vegetables.

Among the varieties of fishes most cultivated in the rivers and ponds of the East, we notice the salmon and shad for the larger rivers and for brooks, ponds and the little lakes that

he also combines faultlessness in all others. Hence it is that he is the favorite among fishes, and deserves to be so.

Trout are peculiarly suited to domestication, being very hardy, easily tamed, conveniently confined, satisfied with plain food, well adapted to artificial breeding, prolific enough to increase rapidly, and having a sufficiently high value as live game, or as a table luxury, to make it worth while to raise them."

The illustration which we present herewith is a view of the hatching house at Cold Spring Trout Ponds, the property of Mr. Stone, taken in 1868. The house is situated in a picturesque situation on Mount Monadnock, New Hampshire. Since that time, exceedingly interesting and important discoveries have been

VIEW OF HATCHING HOUSE AT COLD SPRING TROUT PONDS, CHARLESTOWN, N. H.

abound in New England and elsewhere at the north, the black bass and trout are pre-eminently the fish for domestic culture.

Livingston Stone, Deputy U. S. Fish Commissioner, proprietor of Cold Spring trout ponds, Charlestown, New Hampshire, and Secretary of American Fish Culturists' Association is now in this State. He has passed the summer here investigating subjects connected with fish culture, and has sent East a number

made in the hatching and culture of trout, which improvements we may introduce to our readers, with cuts illustrative, in future numbers of the Press.

There are many places in California, where valuable trout fisheries for the culture of fish for the amateur or even the general market, might be established at very little cost; but as there are certain requisites necessary, to make the business a success, it becomes a matter of

THE HOE FOUR-CYLINDER PRESS.

of fish eggs from this coast. In his admirable and standard work on Domesticated Trout he says:—

The trout has always stood at the head of the fresh water game fishes in the popular estimation. The fickle public may change its favorite some time for a more admired successor, but up to this time the trout has distanced all rivals. This honorable place he has gained and held, not by accident but by merit. He deserves to rank by himself first, for where has the trout his equal? There may be fish of nearly as fine flesh as the trout, but they have a repulsive coat like the pout; or a coarse appearance, like the bass; or a disagreeable one, like the mascalonge; or are full of bones, like the shad; or have no game in them, like the mullet; or fail somewhere to match the excellent points of the trout. There is not one of them that for perfect faultlessness can compare with the trout. This is his special peculiarity. He is faultless. He surpasses all other fish in grace of form, in beauty of coloring, in gentleness of expression, in fascination of manner, in gameness of spirit, in sweetness and firmness of flesh, and in general personal attractiveness, and to excellence in these points

interest to be informed in relation thereto, before expenditure in this line is made, and perhaps disappointment incurred, from too slight an acquaintance with the subject.

Trout culture is a grand success in the Truckee river, the outlet of Lake Tahoe, and large quantities are annually sent from thence to all parts of the State and Nevada accessible by rail. But as beef or animals' livers, hearts and lungs are the principal food of domesticated trout, where such can be procured, it is evident that the vicinity of cities or slaughtering houses where this kind of food can be surely and cheaply obtained, would be a desirable locality for trout ponds; all other requisites as an abundance of cold spring water, a natural and abundant fall and other requisites being obtainable.

*The excellent work from which the above extract is taken can be had of A. Roman & Co., Booksellers, 417 and 419 Montgomery street, San Francisco.

OVER 40,000 centals of wheat were received last week in this city and at Oakland.

The Polytechnic Course of Lectures.

The course of Thursday evening lectures, to be delivered at the Mechanics' Institute Hall this winter, have been inaugurated and the names of the lecturers decided upon. They are separate from the course now being delivered by the Professors of the State University at the same place on Saturday evenings. The initial lecture was delivered on the 16th inst. by Amos Bowman on "Pacific Coast Tertiary Geology and Fossil Man." The following are the names of lecturers, the subjects and dates of delivery: January 23d—"On the Constitution and Principal Properties of Matter," by Prof. J. M. Neri, St. Ignatius College Hall, Market street.

January 23d—There will be formed on this evening, by Henry G. Hanks, at the Mechanics' Institute, at 7.30 p.m., a class in Determinative Mineralogy, and the use of the blowpipe, including an introduction to assaying.

January 30th—"On Zoology (embracing Animal Life on the Pacific Slope)," by Dr. George Hewston.

February 6th—"On the Application of Chemistry in the Industrial Arts and Sciences," by Louis Falkenau.

February 13th—"On the Metallurgy and Local Adaption of Roasting and Smelting Processes," by Charles A. Stetefeldt.

February 20th—"On Amalgamation as practiced in the Pacific States," by Eugene N. Rhotte.

February 27th—"On Chemistry as applied to Metallurgy," by Prof. Thomas Price, at University City College Chemical Laboratory and Lecture Room, Union Square.

March 6th—"On Art and its Uses," by Benjamin P. Avery.

March 13th—"On Entomology: The Insect Foes of Agriculture," by Richard H. Stretch.

March 20th—"On California Meteorology and Sanitary Conditions," by Dr. T. M. Logan, of Sacramento.

"On Forest Distribution in the Pacific States," by H. N. Bolander. (Date to be announced.)

"On Fish and Game, etc., of the Coast, in their Economical Bearings." (Name of lecturer and date to be announced.)

The subscription to the whole course will be \$1 and the books are now open with the Librarian of the Institute, on Post street.

ACTIVITY IN THE BOILER WORKS.—Messrs. Moynihan & Aitken, of the Portland Boiler Works, in this city, are at present occupied in manufacturing six tanks for the Pacific Sugar Refinery, of considerable dimensions, being 5 feet 7 inches in diameter and 16 feet in length. This firm are also filling an order from the California Sugar Refinery for six boilers, each 54 inches in diameter and 16 feet long. Besides the above Messrs. M. & A. have in course

of construction three large boilers for the Stockton Paper Mill. This is what we call commencing the year briskly, the only difficulty that the firm experience being a want of hands, as they inform us that although now employing over fifty workmen they would be glad to increase the number to seventy-five, at least. Twenty thousand dollars worth of orders in two days is, we think, pretty good evidence that this establishment is a success.

A SUCCESSFUL PATENT.—A patent for curing tobacco, which was a short time since procured through the agency connected with this office, by J. D. Culp, has been practically applied and reported as working very successfully. The crop of 40,000 pounds of tobacco, raised by the American Tobacco Company, near Gilroy, in this State, was cured by this process and the tobacco pronounced by those having knowledge of the subject, to be of excellent quality. The process is said to be very economical and is highly recommended.

Laws Under the New Code.

Homestead Corporations.

[Time of corporate existence.]

557. Corporations organized for the purpose of acquiring lands in large tracts, paying off encumbrances thereon, improving and subdividing them into homestead lots or parcels, and distributing them among the shareholders, and for the accumulation of a fund for such purposes, are known as homestead corporations, and must not have a corporate existence for a longer period than ten years.

[By-laws must specify time for and amount of payment of installments, etc. By-laws to be furnished, etc.]

558. Such corporations must specify in their by-laws the times when the installments of the capital stock are payable, the amount thereof, and the fines, penalties, or forfeitures incurred in case of default. A printed copy of the articles of incorporation and by-laws must be furnished to any shareholder on demand.

[Advertisement and sale of delinquent and forfeited shares.]

559. Whenever any shares of stock are declared forfeited by resolution of the Board of Directors, the Directors may advertise the same for sale, giving the name of the subscriber and the number of shares, by notice of not less than three weeks, published at least once a week in a newspaper of general circulation in the city, town, or county where the principal place of business of such corporation is located. Such sale must be made at auction under the direction of the Secretary of the company. The corporation may be a bidder, and the shares must be disposed of to the highest bidder for cash. No defect, informality, or irregularity in the proceedings respecting the sale invalidates it, if notice is given as herein provided. After the sale is made the Secretary must, on receipt of the purchase money, transfer to the purchaser the shares sold, and after deducting from the proceeds of such sale all installments then due, and all expenses and charges of sale, must hold the residue subject to the order of the delinquent subscriber.

[May borrow and loan funds. How, and for what time.]

560. Homestead corporations may borrow money for the purposes of the corporation, not exceeding at any one time one-fourth of the aggregate amount of the shares or parts of shares actually paid in, and the income thereof; no greater rate of interest must be paid therefor than twelve per cent. per annum. For the purpose of completing the purchase of lands intended to be divided or distributed, they may borrow on the security of their shares on the land thus purchased, or that owned by the corporation at the time of procuring the loan, any sum of money which, together with the interest contracted to become due thereon, will not exceed ninety per cent. of the unpaid amount subscribed by the shareholders, but no loan must be made to the corporation for a term extending beyond that of its existence.

[Minor children, wards, and married women may own stock.]

561. Such shares of stock in homestead corporations as may be acquired by children, the cost of which, and the deposits and assessments on which are paid from the personal earnings of the children, or with gifts from other than their male parents, may be taken and held for them by their parents or guardians. Married women may hold such shares as they acquire with their personal earnings, or those of their children, voluntarily bestowed therefor, or from property bequeathed or given to them by persons other than their husbands.

[Forfeiture for speculating in or owning lands exceeding two hundred thousand dollars.]

562. Homestead corporations must not purchase and sell, or otherwise acquire and dispose of real property, or any interest therein, or other personal property, for the sole purpose of speculation or profit. Nor must any such corporation at any one time own or hold, in trust or otherwise, for its purposes, real property, or any interest therein, which in the aggregate exceeds in cash value the sum of two hundred thousand dollars. For any violation of the provisions of this section, corporations forfeit their corporate rights and powers. On the application of any citizen to a Court of competent jurisdiction such forfeiture may be adjudged, and the judgment carries with it costs of the proceedings.

[When corporation is terminated and how.]

563. Except for the purpose of winding up and settling its affairs, every homestead corporation must terminate at the expiration of the time fixed for its existence in the articles of incorporation, or when dissolved, as provided in this Part. No dividend of funds must be made or termination of its corporate existence, until its debts and liabilities are paid; and upon the final settlement of the affairs of the corporation, or upon the termination of its corporate existence, the Directors, in such manner as they may determine, must divide its property among its shareholders in proportion to their respective interests, or, upon the application of a majority in interest of the stockholders, must sell and dispose of any and all of the real estate of the corporation upon such terms as may be most conducive to the interests of all the stockholders, and must convey the same to the purchaser, and distribute the proceeds among the shareholders, or may at any time, when best for the interests of all the shareholders, cause the lands of the corporation to be subdivided into lots and be distributed, by sale for premiums, at auction or otherwise, among the shareholders.

[Payment of premiums.]

564. Such premiums on lots may be made payable at the time they are bid off, and, if not so paid on any lot of land, the Directors may immediately offer the same for sale again. If made payable at a future day, and any shareholder fails to pay his bid on the day the same is made due and payable, the Directors may advertise and sell the shares of stock representing the lots of land on which the premiums remain unpaid, in the manner provided in the by-laws for the sale of shares on account of delinquent installments and premiums.

[Annual report to be published.]

565. The actual financial condition of all homestead corporations must, by the Directors thereof, be published annually in the [a] newspaper published at the principal place of business of the corporation, for four weeks, if published in a weekly, and two weeks, if published in a daily. The statement must be made up to the end of each year, and must be verified by the oath of the President and Secretary, showing the items of property and liabilities.

[Publication in certain cases.]

566. In any case in which a publication is required, and no newspaper is published at the principal place of business, the publication may be made in a paper published in an adjoining county.

Water and Canal Corporations.

[Corporation may obtain contract to supply city or town.]

548. No corporation formed to supply any city, city and county, or town with water must do so unless previously authorized by an ordinance of the authorities thereof, or unless it is done in conformity with a contract entered into between the city, city and county, or town and the corporation. Contracts so made are valid and binding in law, but do not take from the city, city and county or town the right to regulate the rates for water, nor must any exclusive right be granted. No contract or grant must be made for a term exceeding fifty years.

[Duties of Corporation. Rates fixed by Commissioners.]

549. All corporations formed to supply water to cities or towns must furnish pure fresh water to the inhabitants thereof for family uses, so long as the supply permits, at reasonable rates and without distinction of persons, upon proper demand therefor; and must furnish water, to the extent of their means, in case of a fire or other great necessity, free of charge. The rates to be charged for water must be determined by a Board of Commissioners, to be selected as follows: Two by the city and county, or city or town authorities, and two by the water company; and in case they cannot agree to the valuation they must choose a fifth member of the Board; if the four Commissioners cannot agree upon a fifth, then the County Judge of the county must appoint such fifth person. The decision of the majority of the Board determines the rates to be charged for water for one year, and until new rates are established. The Board of Supervisors, or the proper city or town authorities, may

prescribe other proper rules relating to the delivery of water, not inconsistent with the laws of this State.

[Right to use streets, ways, alleys, and roads.]

550. Any corporation created under the provisions of this Part, for the purposes named in this Title, subject to the reasonable direction of the Board of Supervisors, or city or town authorities, as to the mode and manner of using such right of way, may use so much of the streets, ways, and alleys in any town, city, or county, or any public road therein, as may be necessary for laying pipes for conducting water into any such town, city, or county, or through or into any part thereof.

[To build and keep bridges in repair.]

551. Every water or canal corporation must construct and keep in good repair, at all times, for public use, across their canal, flume or water pipe, all of the bridges that the Board of Supervisors of the county in which such canal is situated may require, the bridges being on the lines of public highways and necessary for public uses in connection with such highways; and all waterworks must be so laid as not to obstruct public highways.

Our Gold and Silver Product.

But few people outside of the States and Territories of the Pacific Slope, have any very correct idea of the vast amount of gold and silver that has been produced on this coast during the last twenty-seven years. Even Californians themselves are astonished, when they figure up the yield of the placers and quartz mines, and the silver lodes of this wonderfully rich country. In our eager search for wealth, we lose sight of the vast sums annually extracted, and only when our attention is called to the financial condition of the world, do we stop to consider that a large portion of all the gold and silver now in circulation in the various nations of the earth has been produced on this coast. It is then we learn that we have made the world rich by the immensity of treasure which we have poured into the circulating channels of trade and commerce. Four hundred and ten millions of coin is annually required to conduct the commerce of Great Britain. This is a large sum; but we have sent three times that amount abroad since the opening of our mines, and at least one half of it has found its way, directly or indirectly, to that country. The amount of gold and silver coin in the world, has probably a value of about two billion dollars. Of this vast sum, about seven hundred million dollars has been coined in the United States, and added to the general circulation since 1847, fully one-half of it, or more, having been coined from the gold and silver of this coast.

The amount of gold and silver produced on this coast cannot be ascertained to such a critical nicety as to satisfy the over scrupulous, but counting the bullion exports, comparing them with the receipts as far as they have been published, and making due allowance for gold taken out of the country in the form of dust and nuggets, etc., we find that this coast has produced about one billion two hundred and twenty-five million dollars. This is almost an incredible sum; the significance of it can scarcely be realized. This enormous amount of bullion has principally been produced in this State, and at least four-fifths of the whole sum has been gold, the remaining one-fifth of silver having been obtained in small quantities in California, but principally in Nevada. Our bullion yield has never fallen below fifty millions of dollars, while it has frequently reached the sum of from sixty to seventy millions annually. Last year it was estimated at something like seventy two millions, and for the year now closing, many estimate the yield still higher.

In speaking of the immense yield of the Comstock, the export of coin, etc., a paper remarks that

"THE WONDERFUL MINES OF COMSTOCK,

Whose yield in twelve years has added to the argentiferous wealth of the world, the most incredible amount of one hundred and fifty million ounces, representing about the same number of dollars. Discovered in 1860-61, and yielding in the latter year, bullion to the value of six million dollars, it reached a yield of twelve million dollars in 1863, and sixteen million in 1867. Enough gold and silver has been raised in the Pacific States since 1847 to give two thousand dollars to every man, woman and child in the State, and six thousand dollars to every male adult. With such an abundance of wealth, our people have been remarkably liberal; they have not kept their treasures by them, but have sent them to every part of the earth in exchange for luxuries formerly accessible to only kings and princes. By much the greater part of our bullion has been exported. We have got rid of in this way, up to the present time,

ONE THOUSAND AND THIRTEEN MILLIONS OF DOLLARS.

In the first two years of our existence we sent abroad in this way, sixty-six millions; in 1851

and 1852, over ninety millions; and since then amounts equaling in value, from seventeen to fifty-five millions seven hundred thousand yearly; the latter, the largest export, having taken place in 1864. Of the total, the East has taken the largest share, over one-half—not less in round numbers than six hundred million dollars have been sent thither since 1850. One hundred and ninety million dollars has been poured into the bank vaults and coffers of Great Britain during the same interval. China, that reservoir of the precious metals, into which, as the waters of great rivers pour into some giant lake, without outlet, has taken over seventy-seven millions since 1855. Of the balance we have sent about nine millions to Panama, nearly one million dollars to the Philippines, seven hundred and twenty thousand to Mexico, one million seven hundred thousand to Central America, about a million and a half to the Sandwich Islands and to Chile, and the balance to Australia, Peru, Calcutta, the Society Islands, Havana, British Columbia and various other countries. California and Nevada have thus been the golden and silver sources whence

RIVERS OF WEALTH

Have poured over nations—over continents—and these sources, be it remembered, have been ones that never have failed or materially lessened for a quarter of a century. Of this great outward flow, of these Plutonic streams, a considerable proportion, particularly of late years, has consisted of

COIN,

Particularly of gold coin; for the greater part of the silver has been exported in the form of bullion. About one-fourth of all the gold discovered on the coast has been coined in San Francisco, and a much larger proportion in the other Mints of the United States. The value of gold coin issued from this Mint up to the beginning of the present year has amounted to \$312,681,713.04, and that issued from all the Mints of the United States, made from gold mined on the Pacific slope, has amounted to upwards of seven hundred millions of dollars—seven-eighths of all the gold coined in the United States since the declaration of independence. And of all the silver coined in the United States since 1841, equaling in value \$16,210,582.32, the Pacific States and Territories have supplied one-half nearly, of which, \$6,974,925, have been issued from the Branch Mint in this city. Of all the gold coined in this city, the largest quantity was issued in the shape of money in 1856, when \$29,209,213.24, was coined, this being nearly three times the value of the amount first coined here in 1854, which was \$10,842,281.23. This latter doubled the following year, and, as we have seen, nearly trebled the second year after; but it has never attained anything like these dimensions since, save last year, when it exceeded \$26,000,000 in value. During all the other years it has wavered in value, between about fourteen and nineteen millions of dollars. The greatest quantity of silver coined here was in 1868, when \$822,000 worth was converted into money. And the extent to which gold of California production enters into that minted in the Union, is shown conclusively by the fact, that out of all the gold coined in the United States Mint at Philadelphia, amounting in value to over two hundred and fifty-seven million dollars, not less than two hundred and thirty-one million dollars worth was minted from California gold.

THE PRECIOUS METALS.—The New York Journal of Commerce estimates, on the most reliable returns at its command, the annual yield of gold at about \$55,000,000, and of silver about \$17,000,000, making \$72,000,000 as the annual product of the United States. The total annual yield of the world is about \$210,000,000. The imports of specie and bullion from foreign ports for the year ending June 30, 1872, is put down at \$13,743,886, against \$21,900,024 for the year ending June 30, 1871. The exports of specie and bullion to foreign ports in the fiscal year ending June 30, 1872, were \$93,543,885, against \$79,877,534 in the fiscal year ending June 30, 1871.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhi-
bition of 1862 awarded the Prize Medal, and Gold
Medal at the Mechanics' Institute Fair, 1871, of San
Francisco.
The Pacific Stone Company call the special attention
of Architects, Engineers and the public in general, to
the SUPERIOR QUALITY of the Stone now being man-
ufactured by them in this city under the Ransome
Patents. They make to order and keep in stock:

Building Fronts, Water Pipes
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grind-
stones, all of which we guarantee superior, and at a
price far below that of hand-work.

The attention of private parties intending to build is
respectfully solicited.

EUCALYPTUS.

The attention of the Medical profession is respect-
fully called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of Intermittent and Marsh
Fever, often supplanting the use of Quinine. The
paroxysms of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Blad-
der it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.
This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus.

THE ELIXIR OF EUCALYPTUS.
This compound presents the properties of the leaves
in a palatable form and elegant appearance. Dose—
One tablespoonful, to be repeated as often as the case
demands.

Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the greatest number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam hotwells, as desired.

This Amalgamator Operates as Follows:
The pulp being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco

Richardson & Co., Copper Ore Wharves,
SWANSEA.

RICHARDSON & Co. have been for thirty years established
in Swansea as Agents for the preparation, Sampling, Assay-
ing, and Sale of Copper, Silver, Gold, Lead, Zinc, and al-
other Ores and Metals, for which they have extensive Ware-
houses and Wharves under cover, 1,600 feet of Quay Front-
age within the Floating Dock, and the most complete Ma-
chinery and Appliances. They are also prepared to make
advances against Ores in anticipation of realization, and to
guarantee all payments when required. 11v24-1y

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE

Caution Against Fraud.

The success of this most
delicious and unrivalled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having been
supplied with a spurious Worcestershire
sauce, upon the wrapper and labels of which the names
of Lea and Perrins have been forged, L. and P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-
ter; Crosse & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. 15v24-1f

Betts's Capsule Patents.

To prevent infringements, notice is hereby given, that
Betts's name is on every Capsule he makes for the principal mer-
chants in England and France,
thus enabling vendor, purchaser, and consumer not only to
identify the genuineness of the capsule, but likewise
the contents of the vessel to which it is applied.
The LORD CHANCELLOR, in his judgment, said that the
capsules are not used merely for the purpose of the orna-
ment, but that they are serviceable in protecting the wine
from injury, and insuring its genuineness.

Mining and Other Companies.

Owing to the space necessary to wait the present large edition of the M. & S. Press we are obliged to go to press on this day's edition—which is the very latest hour we can receive contributions.

Amazon Silver Mining Company—Location
of works, Ely District, Lincoln County, Nevada.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of October, 1872, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary of said Company, at his office, No. 409 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the sixth day of January, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 25th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
M. J. McMANUS, Secretary pro tem.
Office, 609 Sacramento street, San Francisco, Cal.

Amazon Silver Mining Company—POSTPONEMENT.
The delinquent stock on the above mentioned assessment is hereby postponed until Thursday, the 23rd of January, 1873, and the sale thereof until Friday, the fourteenth day of February, 1873. By order of the Board of Trustees.
M. J. McMANUS, Secretary pro tem.

Cordillera Gold and Silver Mining Company—Location
of property, Morelia Mining District, Chihuahua, Mexico.
At a meeting of the Board of Trustees held at the office of the Company, December 21st, 1872, a special assessment of fifteen cents (15 cts.), was levied on each and every share of the capital stock of the Company, payable immediately in United States gold coin, to the Secretary, at his office, corner Market and Spear streets, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, February 21st, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 19th day of February, 1873, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
HEARY R. REED, Secretary.
Office, 221 Washington street, San Francisco, Cal. December 24th, 1872.

Gold Run Mining Company—Location
of works, Nevada County, Cal.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of December, 1872, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, corner Market and Spear streets, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, February 21st, 1873, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 19th day of February, 1873, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
G. C. PALMER, Secretary.
Office, corner Market and Spear streets, S. F. Jan 1st

A Special Meeting of the Stockholders
of the Gold Run Mining Co., for the election of a new Board of Trustees, and for the transaction of such other business as may properly come before the meeting, will be held at the office of the Secretary, corner of Market and Spear streets, on Tuesday, February 4th, at 12 o'clock M. By order of Board of Trustees.
G. C. PALMER, Secretary.
Jan 1st

Great Blue Gravel Range Company—Location
of works, Elko Gravel Range, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 16th day of November, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames**HAMMERED IRON**

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention
The highest price paid for Scrap Iron. 9v143**STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.**

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of hullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation.

PRICES MODERATE.
J. H. WEED. V. KINGWELL.**Machinery.****N. Seibert's Eureka Lubricators.****THE HIGHEST PREMIUM**

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23ff

PACIFIC LAMP MANUFACTORY.

EMIL BOESCH,
Patentee and Manufacturer of
LAMPS, LANTERNS AND REFLECTORS.

The patent lamp here represented by the oil is the cheapest
and best of the market. We keep constantly on hand the 15-inch
and 20-inch lamps. They are especially adapted for use in large mines, tunnels,
and other places where a powerful light is required. They are well known as the
"PACIFIC LAMP" and are in great demand. Also a
patent advertising lamp, for halls, restaurants, hotels, bar-rooms,
etc.

NEW MINING LIGHT.
The proprietor also holds letters patent covering

Sketch of Delaney's New Patent Cushion.

DESCRIPTION OF ENGRAVING.
E, pin or regulator, extending into rail; D, steel wire,
tending from pin into and through rubber cushion; B, rub-
ber cushion; C, is end of rubber cushion; A, lining.
Their construction is of the simplest kind, thus making
no heavy expense for superfluous elaboration. The im-
provement is a steel wire running lengthwise, and commu-
nicating with a pin at each end and inside of the rails;
the wire is imbedded in the rubber cushion, near its edge or
surface. The pin mentioned is controlled and operated
upon by a key, regulating the tension of the wire, accord-
ing to the necessities of the case. It keeps the edge of the
cushion straight and sharp. It prevents the rubber hard-
ening from the impingement of the ball, and, above all
other considerations, the angles are bound to be perfectly
correct.

The ball never lumps from the table, however severe the
strokes. It makes no noise when leaving the cushion.
Nine cushions are made upon our tables with the same
degree of force requisite to make six upon any other.

These unrivalled cushions are self-protective, and will re-
tain their elasticity either in hot, cold, dry, or damp weather,
almost forever.

Thousands of Delaney's cushions have been introduced
throughout California and the Great West, where the
largest billiard manufacturers now make exclusive use of
them, to the eminent satisfaction of their patrons.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLA-TING
POWDER,
OF SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our

HERCULES POWDER.
Which combines all the force of other strong explosive
now in use, and the lifting force of the BEST BLAST-
ING POWDER, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.

READ THIS. HEALTH FOR ALL.

What is Wealth, or Fame, or Life, Without Health?

Persons afflicted with any Disease, helped or not by other treatment, should consult DR. AIKIN, who effects many astonishing cures, and treats, with unequalled success, all those serious, old-standing diseases (not understood or well treated by the family physicians or others), and performs the more difficult, particular operations in Surgery.

The Approved, Scientific Treatment given by

DR. AIKIN

URES RECENT AND CHRONIC DISEASES OF THE Eyes, Ears, Throat, Lungs, Heart, Nerves, Stomach, Liver, Kidney and Blood; including Catarrh, Deafness, Discharges from the Ears, Failing Sight; Sore, Weak, or Inflamed Eyes; Cough, Bronchitis, Consumption, Night Sweats, Epilepsy, Palsy, Nervous Affections, Debility, Neuralgia, Rheumatism, Dyspepsia, Piles, Dropsy, Scrofula, Fever Sores, Skin Diseases, Erysipelas, Corpulence, Goitre, Hare-Lip, Fistula, Rupture, etc.

Ladies out of Health, assured of Speedy, Safe Cure.

Oscurs and Tumors easily removed; also, Wens, Warts, Enlarged Tonsils, and Disfiguring Marks. Young or old, desiring to attain and preserve full health and vigor, no matter what they have read or doctored, first or last, will be given conscientious counsel and reliable aid, without quackery or deception; and those affected with blood or other diseases, who would avoid mercury, poisons, or nauseous drugs, can be sure of obtaining of DR. AIKIN the most efficient treatment by mild remedies, and a rapid, thorough and permanent cure. Those visiting this city (travelers, miners, and others) are advised to consult DR. AIKIN for skillful and satisfactory treatment of any case, medical or surgical. Terms reasonable. Medicines, etc., supplied. Patients, of every class, can rely on the most careful attention and best results. Do not suffer or delay, nor use the worthless, injurious patent medicines.

Whatever your disease or circumstances, or doctoring in vain, do not despair, for you can here be certain of relief if ever curable.

Come prepared to arrange requisite treatment. Office hours, 9 to 3, and from 4 to 8. Sundays, 12 to 2. Call, or write symptoms carefully, and send (by registered letter, P. O. Order or Draft) \$10 to \$50, according to case, for Advice and supply of Remedies by Express. Address N. J. AIKIN, M. D. Office—137 Montgomery street, corner of Bush, opposite Occidental Hotel, San Francisco. 21v26ow3m

Belmont Mines and Mills.

Our occasional correspondent, Mr. G. Kustel, well-known as a mining engineer and author of several works on metallurgy, etc., and who left this week for the Vienna Exposition, made a short visit to Belmont, Nevada, last week and sends me a few notes from there. He says that mining enterprise is quite active now in Belmont, owing principally to the successful start of the Monitor-Belmont mill, and to the promised mill operations of the El Dorado mill, which is expected to be in motion in a few weeks. To give a better idea of the situation of the ledges than merely by verbal description, Mr. Kustel encloses me a sketch which we have had engraved, and which, although a free hand drawing, made after a plan by Geo. Ernst for the Monitor-Belmont Company, is sufficiently correct to serve the purpose. The

Monitor Belmont Mines

Has three tunnels, as the map shows. Tunnel number three has been opened quite lately under the superintendence of Mr. W. T. Wright, to the length of 500 feet, at which distance the ledge was struck. From tunnel No. 1 to No. 3 is 185 feet on the vein, or 112 feet perpendicular depth. There are no hoisting works at the mine, all the ore being carried out by way of the tunnels at present. There is a great deal of so-called "virgin ground" of wet chloride ore, to be taken out from above tunnel No. 1 down to tunnel No. 3. From this mine about 520 tons were shipped to the Manhattan mill, in Austin, yielding nearly \$500 per ton on an average. During my presence at Ellsworth, to the mill in this place also 30 tons were shipped from the Monitor, of the above richness. At present, having their own mill near by, there is no necessity of selecting high grade ore, neither is it of any advantage to beneficiate very rich ore. The vein continues downwards from the lowest level from two to four feet wide, probably with an increase of rich sulphurets (all sulphurets in the vein being rich).

This Mill

Belonging to the Monitor-Belmont Co., under the superintendency of Mr. MacMasters, has twenty stamps, seven pans, five settlers and a Stetefeldt roasting furnace. All machinery works perfect. The battery transmits the pulverized ore by elevators and conveyers to the furnace, or such chloride ores as do not require roasting, directly to the hoppers near the pans. The mill runs on two hundred dollar ore at

present, turning out very fine bullion, in shape of about 1,500-ounce bricks. I have been allowed to select very interesting specimens for the Vienna World's Exposition, from this and also from other mines; and, by the way, to tell the truth, I could collect here in the mines in a few days more valuable specimens for the Exposition than I could with the San Francisco people in five weeks, even with the assistance of all the meetings and speeches. The

Belmont Mine

Is now 280 feet deep on the incline. There is also very good ore in the mine. The fault that occurs in this ledge, that is, the pure mineral,

Coin.—The number of \$20 pieces coined at the Mint in this city during 1872, amounted to \$15,600,000, and all the gold coinage was \$16,000,000; the silver coined was \$380,000. The Bulletin publishes a table of the total coinage of the mint for the past ten years including 1872, of both silver and gold, and the whole amount is \$184,308,180. In this connection it may be stated that the deposits in the mints of the United States since their foundation to the present year, have aggregated the enormous sum of \$836,205,463, of which more than \$730,000,000 was the product of our own gold

Important Mining Suit.

Overman vs. Dardanelles is the title of a new suit commenced on the 18th, in the District Court of this County, as the Territorial Enterprise, which promises to possess great interest to the mining community. The controversy is to decide the ownership of twelve hundred feet of the extension southward of the ore body now being worked in the Crown Point and Belcher mines, and which, it is expected, will be found in the neighborhood of the Overman new shaft.

The Dardanelles Company having applied for a United States patent for 1,200 feet of ground lying west of the Overman new shaft, the latter Company are obliged to protect in the Land

Office, and to bring this suit to quiet title. The only question arising in the case is whether the ledge worked in the Overman old shaft, and which continues southward from that point toward American Flat, and the eastern ore body which appears to run in the direction of Devil's Gate, are one or two ledges. If one ledge, it belongs to the Overman by virtue of prior location; if two ledges, the western or American Flat ledge belongs to the Overman, and the eastern or Belcher continuation is the property of the Dardanelles.

In the working from the Overman old shaft no ore has been found at a greater depth than 400 feet, and in the Overman new shaft, some 2,000 feet east of the old one, a depth equivalent to about

1,100 feet has been attained and the ledge is not yet reached. In order, therefore, to show that there is but one ledge, it will be necessary to trace a connection between the two ore-bodies through a vertical distance of some 600 feet and a horizontal distance of about 2,000 feet.

Many well informed miners believe that this cannot be done. As the estimated value of the property in controversy runs up to millions, it is easy to see why the case possesses more than ordinary interest. Messrs. Williams & Bixler are the counsel for the Overman Company, and we understand that John Garber, James A. Hardy and Harry I. Thornton have been retained by the Dardanelles.

HOME INDUSTRY.—The Mission and Pacific Woolen Mills have added another branch to their business, by undertaking the manufacture of Ingrain carpets. Their mills have attained such a reputation both at home and abroad by their superior products that there is no doubt but that the carpets will be as good if not better than those made in the East.

PLACERS IN MONTANA.—Montana with her extensive placer mines yielded last year according to Wells, Fargo & Co's statement, the handsome sum of \$4,442,135. Now we hear of the discovery of new and promising placer mines on the left fork of Little Deep Creek, in Meagher county.

SURFACE-GROUND PLAN OF BELMONT MINES.

pays \$3,700 per ton. There is a big pile of ore near the hoisting works, waiting for a chance to be worked in the Monitor mill. The light yellow lead ore, very frequent in the ore, is quite interesting but always heavily charged with chloride of silver. The El Dorado mine I had no time to visit, but there is also a great deal of rich ore waiting for the mill. I received for the Vienna Exposition some most interesting and rich ore from

Jefferson Canon

Of the "Prussian" ledge. It is a contact vein between slate and porphyry. I did not see the mine, but give it as I hear from others. There are about 1,500 pounds of this ore here; all looks alike and uniform. The specimen I received shows \$10,700 in silver and \$2,019 in gold, together \$12,719 per ton. The peculiarity of this ore is, that it is a conglomerate of very fine, about one-eighth of an inch long but very perfect quartz crystals, chloride and sulphurets of silver and telluride of gold; this latter occurs also in a vein in the neighborhood of the "Prussian," called "Sailor Boy's Ledge." It is said the vein is from six to twelve inches wide, but certainly not all pay twelve thousand dollars per ton.

SUTRO TUNNEL.—Very rich float rock has recently been found on the line of the Sutro Tunnel which averages up into the thousands.

and silver bearing States and Territories, within the last 24 years.

ARTIFICIAL MARBLE.—The Manhattan Marble Company, whose works are located in Oakland, turned out their first piece of work last week. The artificial marble they produce is susceptible of a fine polish and may be made in any color. This is the third company manufacturing artificial stone in this State. In this connection it may be stated that a fine quarry of variegated marble has recently been discovered in lower California, which is pronounced equal to any foreign article.

JAPANESE PROGRESS.—An industrial fair and exhibition is to be held in the city of Kioto, in Japan, in March, and a number of San Francisco manufacturers are about to forward articles to that place. In view of the increasing trade with the Orient our artisans and manufacturers should take advantage of every opportunity to show their wares, and get the business orders before Eastern agents are able to do so.

MORE QUICKSILVER.—A rich vein of cinabar is reported as having been found on the Arroyo Grande, San Luis Obispo County. This branch of mining promises to be prosecuted over a wider range in this State than heretofore.

CORRESPONDENCE.

Placer County Mines.

Promiss of a Good Water Season—Yield of Old Claims at Forest Hill.

[Written for the Press.]

So far, the present has proved one of the best winters for water we have ever had in this neighborhood; the rain, though a little tardy, having been copious, and falling at such a steady but moderate rate, and at such intervals as produced the greatest possible amount of good. Should the balance of the season bring the additional quantity usual, the ditches will be kept in good supply till a late period next summer, insuring for the mining interest a great prosperity the coming year.

As is generally well known, we have at this place one of the most prolific of our old river channels, Forest Hill having been for many years one of the most

Productive Mining Districts

In the State—it being estimated that within half a mile of the town as much as twelve or fourteen million dollars have been taken out. Commencing in '51, the district during the next ten years saw its most prosperous days, beginning to decline about the time of the Fraser River excitement. Prior to this many of the drift claims here had yielded enormous quantities of gold. The Dardanelle, for example, had turned out \$2,000,000; the Jenny Lind, over a million; the New Jersey, \$850,000; the Deidesheimer, \$650,000; the Independence, \$450,000; the East and Norwood, the Rough and Ready, the Gore, the Snyder and the Maine, each \$250,000; and many other claims from \$50,000 to \$200,000 each; and yet, owing to the careless and even reckless manner in which these claims were worked,—causing extensive caves, whereby much of the best ground was covered up,—but few of them were more than partially exhausted, while fully one-half of the gold contained in the gravel was lost through the imperfect modes adopted in washing and working it. Many exceedingly rich spots were met with in this channel. The New Jersey Company took out \$850,000 from an area 500 ft. long by 400 wide; the Gore, \$250,000 from a space 100 by 200 feet; the Independence, \$10,000 from an area of 20 feet square, and the Snyder \$40,000 from a basin only 380 feet in diameter, with many other noteworthy examples of success.

Relocation of Old Claims.

But all this occurred at a time when the miner expected to make large wages, when they did not well understand how this sort of work should be done, and when the methods for saving the gold were wasteful and defective, wherefore, having worked out the richer and more accessible portions of their claims, they were easily lured away by the discoveries that from time to time elsewhere occurred during the next ten or twelve years. Latterly many of these men have been returning to their old places of resort, and we now find them looking about for means to put these once forsaken claims in working shape, or for parties to buy them, for it is found that a number of them must be aggregated and worked under one ownership, by which plan alone they can be operated with profit. As this requires time and capital not much has yet been accomplished in this neighborhood. Nevertheless, we have here the properties for many large and successful operations, and have already made a beginning. Last summer a number of San Francisco capitalists commenced the business of securing titles to some of the best claims here, with a view to consolidating them and working them on a large scale. In a few instances this has already been effected, though in most of these cases there has occurred such delay, through the difficulty encountered in securing so many different titles, that it will require some months yet to consummate the business. It being evident, however, that the old plan of working these claims will no longer do, there is little question but more of these proposed enterprises will be carried out the coming summer, and something of its former prosperity be restored to this long neglected neighborhood. Of the few already organized and under way, the most promising is that of

The Great Blue Gravel Range or Powsil Co. Now operating on this channel a few miles below here at Todd's Valley. To this place the old river bed is clearly traced, not only by unmistakable surface indications but also by several rich claims opened up at various intermediate points along it, the first of these being the once famous Dardanelle ground, one mile below here, and another the Spring Garden ranch, half way between that and the Powell claim. This latter covers an area of great extent, nearly two miles of the old channel lying within its boundaries. The largest of the old company's claims in this vicinity, even from which so much gold was taken, were small compared with this. The Dardanelle had a frontage of 1,000 feet; the New Jersey 650 feet; and the Jenny Lind 450 feet; while the Gore claim had barely 100. But the running of an expensive tunnel to open each of

these small claims when it should have served for working a large extent of ground was the great mistake of the early day, and one that is now happily being avoided through the system of aggregation before mentioned.

The plan of utilizing such of these old tunnels as had been run on unsuitable levels is also, coming more into vogue. Where found too low for convenient working, or too high for drainage the practice of raising a shaft to the stratum of pay gravel in the first case, or sinking an incline in the other, is now very often adopted; recourse to these, especially where there is not a large amount of lifting to be done, being found more economical than the construction of a new tunnel. As affording means for prospecting grounds, and sometimes also for permanent working purposes, this mode of procedure is often advisable.

In the exploration of the Powell claim it has with good judgment been adopted. A tunnel was here carried in some years ago for a distance of 750 feet, at which point the old river channel was reached, but on a level too high to afford drainage. From the inner extremity of this tunnel an incline shaft was sunk on the vein rock to a depth of fifty or sixty feet, when the water so increased that the company, being without machinery for pumping, were compelled to suspend work.

Pay Dirt at Last.

Lately operations on this claim have been resumed, but instead of starting a new tunnel on a lower grade an extensive chamber has been excavated at the head of this incline, 750 feet in from the mouth of the tunnel, in which an engine, with boiler and pumping gear, all new and powerful, have been placed; a shaft having been carried over a hundred feet to the surface to answer the purpose of a chimney. The incline having been sunk a further distance of 60 feet, is now below the heavy river boulders that immediately overlie the stratum of auriferous gravel in this old channel, and there can be no doubt but the company will soon be taking out rich pay dirt at this point.

Owing to the unexpected depth of the channel here they have been delayed in reaching its bottom; but this having now been so nearly accomplished the owners are likely to reap a rich harvest as the reward of their perseverance and patience. OLD MINER.

Gravel Mining in Shasta County.

Fifteen or twenty years ago the section of Shasta county drained by Clear creek, Dry creek, Eagle creek and Cottonwood, says a correspondent of the *Bulletin*, was alive with eager prospectors and miners, and the classic names of Horsetown, Muletown, Piety Hill, Roaring river, and other mining camps equally euphonic in name were familiar as household words. Lately these have been almost forgotten; a few meek-eyed Israelites, "Heathen Chinee," and scattering veterans from the great army of '49 constituting their entire population. But a combination of circumstances now at work seems likely to drag these places from their long oblivion, and place them prominently before the public as remarkable fields for mining enterprise. Until the Central Pacific and Oregon railroads gave access to this remarkable district, it was almost inaccessible, and a trip here could be made only by way of Oroville, and at a great expenditure of comfort, time and money; to this is mainly attributable the small progress made in developing the mines here.

At the Minns.

Fifteen miles from Cottonwood station the evidences that you have reached a mining country are rudely thrust upon you. In the ravines and on the flats lie unsightly heaps of tailings and rock—old sluice-boxes, torn-up soil and all the wreck and ruin wrought by placer-mining show the work of devastation. Standing here on the main ridge, you see the two principal water-courses of the district—Dry creek and Clear creek. These run towards the Sacramento, divided from each other at this point by a sharp gravel ridge, several hundred feet high and about three-quarters of a mile in width. A considerable body of water runs all the year round in Clear creek, and its banks and bars have been mined for miles up and down, and several prominent residents of the State—among others, Major Redding—are credited with having made their "raise" here. Dry creek, on the other hand, carries water but a few months in the year. In this creek, whenever water and the season admitted of it, surface-mining was carried on to a considerable extent, and it ranked high in the category of "grub diggings." But a few years ago a miner more enterprising than the others, determined to sink a shaft to bed-rock in the creek during the dry season. After sinking some sixty or seventy feet, water drove him out, but his labor proved the existence of a bed of blue gravel carrying water-worn boulders, and yielding handsome prospects all the way down. On the strength of this discovery, by purchase and otherwise, he effected a consolidation of claims along the head of the creek for a length of three miles, and a width of half a mile, making in all a property of 1,800 acres. This, in connection with a water-ditch, he brought before the notice of some San Francisco capitalists, who purchased the mine and

formed a company to develop it under the name of the

Dry Creek Tunnel Company.

The parties chiefly interested are Messrs. B. G. Lathrop, F. D. Atherton, John Skinner, J. W. Brown, and one or two others. These gentlemen have spent two years time and upwards of \$50,000 in developing, and persons accustomed to the lavish expenditures for such purposes in Nevada and Placer counties, would be surprised at the amount of work accomplished for the outlay. In opening this mine so that the most recent hydraulic improvements might be applied to its working, the difficulty was to secure a tail-race. Dry creek was flat and afforded none; but a survey established the fact that the bed of Clear creek was several hundred feet below that of Dry creek. Here was a solution of the difficulty. A tunnel and deep cutting from creek to creek was made. It is 3,600 feet in length, and has occupied two years' time in construction, and used over 200,000 feet of lumber. As this was the first enterprise of the kind in the district, the owners had many unforeseen difficulties to contend with. They had to build houses, shops and sawmills, and employed a small army of blacksmiths, carpenters, miners and teamsters. This tunnel is a remarkable piece of engineering. It terminates at a point near the center of the company's claim, 100 feet below the surface of the ground. The company at present have only a limited supply of water, but have already surveyed a ditch which will afford them about 2,000 inches all the year round. The surface-gravel, being the debris from the surrounding hills, which are auriferous, is rich, paying an average of fifty cents per cubic yard. The blue gravel underlying the upper strata yields fully as well. A partial clean-up of the sluices will be made some time during this month. Leaving this company's claim and keeping along the ridge about a mile further, we reach the claim of the

Piety Hill Gravel Mining Company.

Here another hydraulic operation on a large scale is being carried on. This company is also composed of San Francisco men, who have invested a large amount of money in the purchase and development of their claims. They own a gravel-bed 300 acres in extent, and averaging fifty feet in depth. The deposit has no tenuous or clayey superstratum, but consists of a mass of auriferous red and blue gravel, deposited in regular layers, and yielding more or less gold from top to bottom. The bed-rock is in a hard metamorphic state. A large amount of work has been done on this claim. Prospective tunnels have been run hundreds of feet in almost every direction, and upwards of forty shafts have been sunk to bed-rock, exposing, in every instance, the same quality of gravel. A tail-race, 1,500 feet in length, has been cut through hard, blasting rock, in some places fifteen and twenty feet deep, at a cost of over \$25,000. Twenty-three miles of ditches supply 800 inches of water during the greater part of the year. During the coming season the claim will be worked to its full capacity. As yet only patent tests have been made as to how it will pay. On the north side of the main flume a washing of 50,000 cubic yards yielded \$9,000, or an average of eighteen cents per cubic yard, on the west side 2,000 cubic yards gave \$741.25, or an average of thirty-seven cents per cubic yard. The company are using two of Craig's "Little Giant" hydraulic machines, either of which will throw 400 inches of water under a pressure head of 100 feet.

The Silver Minns.

Several years ago some excitement arose regarding quartz discoveries in Shasta county, but it soon died out. The ore was refractory. The necessary machinery was expensive and almost unobtainable at that time. The knowledge how to work such rock was limited, and sundry other causes united to bar further progress. A change is coming over these things. The ledges are situated in a chain of rugged mountains, already referred to. West of Piety Hill, the ledges crop out boldly in granite near its junction with slate formations. They are numerous and well-defined. The gangue is quartz, and the pay-ore blackish sulphurets of silver, carrying also a small quantity of gold. The ores are base and require roasting before yielding their treasures. In ascending the hill, the first vein of any consequence is the Crystal. This shows for half a mile by croppings. A shaft eighty feet deep has been sunk upon it. Rock ten feet from the surface only assayed a few dollars, but from the bottom of the shaft gave \$360. Several tests were made from other parts of the vein equally satisfactory.

This claim was recently purchased by San Francisco parties, and a contract has just been let for the extraction of one hundred tons of ore. It is the intention of the owners to sack the ore and ship it to San Francisco for the present. Further up the hill lies the "Cincinnati." Some little work has been done on this vein at a point where it has been crossed by a mountain stream. Enough was extracted to give a fair working test. It paid \$200 per ton. Still further up the mountain lies the "Chicago." A small five-stamp mill and furnace are at work on this vein. On account of limited facilities for working, the rock extracted is selected with scrupulous care, and only such as pays \$400 and \$500 per ton is worked. In this vein, on the hanging wall, is found a thin seam of ruby silver, red as blood and very beautiful. Considerable work has been done on other veins, notably the Red Chief, on the dump of which there lies one hundred tons of ore waiting shipment, which will pay \$60 per ton without assorting. With this excellent showing,

within twelve hours of San Francisco, better than half the "new" districts in the sagebrush and desert, will it be believed that there is not a single mill of any account in the county? Many of the mines have no owners and are open to location, while others can at the present time be bought on most favorable terms. Here is an opportunity for investment at our door, and one that can be looked at in person at a small outlay of time and money.

Silver Bullion and Coin.

We have heretofore, on several occasions, remarked upon the increasing silver production of this coast, says the *Alta*, and at the same time the lessening demand for it in the markets of the world, leading to the project of coining a dollar which might find free use in China commerce. In the very full, able and exhaustive report of Dr. H. R. Linderman, on the Branch Mints of the Pacific coast we have most interesting facts in relation to bullion and its coinage, particularly in relation to large coinage of fractional silver in San Francisco last year, and which was stopped in March, and in relation to the proposed commercial dollar. So long, however, as Great Britain coins gold free and the United States charges one-half of one per cent., the coining value of gold in London will be higher than it is here. Several illustrations are presented confirmatory of this fact. The price of silver bullion varies at our several Mints. At Carson \$1.21 is the price per standard ounce, while at Philadelphia and at New York it is \$1.22½. The San Francisco Branch is not now purchasing. The average price at the British Mint during the past year was \$1.22.55 per ounce of the British standard of 925 thousandths, equal to \$1.19.2 per ounce of U. S. standard (900 fine), or 2½ per cent. premium on the par value of the silver dollar. The last London quotation was 60d, equal to 1½ per cent. premium only. One and three-fourths per cent. premium on our standard would give \$1.18 39 per ounce. Two per cent. would give \$1.18 68 per ounce. Two and a half per cent. would give \$1.19 26 per ounce. Four per cent. would give \$21 per ounce. It is evident we are paying above the market rate for silver, and the report advises that the subject of reducing the Mint price receive consideration of the Department, fixing the price at some specific sum per ounce, and not an assumed premium upon the intrinsic value of an ounce as now. When the Mint bill passes there will be no silver dollar of account upon which to reckon the value of silver bullion or the premium. If the silver is to be paid for in gold, as formerly, the price should not be fixed at over \$1.18½ per standard ounce, which would be nearly 2 per cent. premium; but if it is to be paid for in silver coins it might be fixed at \$1.20 per ounce. Having concluded his examination of the Branch Mints the Doctor refers to several practical questions of collateral interest connected with the production of the precious metals and the system of exchanges to which they give rise. The amount of silver bullion annually produced from the mines of the United States is increasing and now amounts to about twenty millions per annum, exclusive of the gold it contains, thus rendering the future value of silver as compared with gold a matter of national importance. The fluctuations in the relative value of gold and silver during the last hundred years have not been very great, but several causes are now at work, all tending to an excess of supply over demand for silver, and its consequent depreciation. Among these causes may be stated the increasing production, its demonetization by the German empire and by Japan, and its continued disuse in this country, the effect of which will be to bring to the market as bullion large amounts hitherto used as coin. Even if silver should be adopted by Germany for subsidiary coinage, not more than \$50,000,000 will be required for that purpose, which will leave \$300,000,000, or about 9,000 tons, to be disposed of as bullion, a market for which can only be found in such of the European States as maintain the single standard of silver, or the double standard of gold and silver, and in China and the Indies. These facts indicate the gradual adoption of the gold standard. The true policy of this country, therefore, is to seek a market in China for its silver bullion, and to do this it must be put in form to meet a favorable reception there—it must be appreciated. Had the United States dollar equalled in fine silver the old Spanish dollar, as was originally intended, it would no doubt long since have become an important agent of commerce. He thinks the silver dollar, being a useless coin, both as respects circulation and commerce, should be abolished, and a new one made which will meet certain commercial requirements, and recommends, to meet the California trade, a new coin, or disk, which shall be slightly more valuable than the Mexican dollar, to be made only upon the request of the owner of the bullion, and to be paid for by him, and not legal tender, but simply a stamped ingot with its weight and fineness indicated. If this new coin should be accepted in our trade with China, it would supersede the Mexican dollar, and probably command a premium of 6 or 8 per cent. The product of our silver mines is now exported at an average discount of at least 2 per cent. Dr. Linderman's suggestion, if followed, will be of advantage not only to our commerce but also to our mining industries. As this new coin would also be a most desirable form for use in the arts, it would most probably put a stop to the melting of our silver coins.

MECHANICAL PROGRESS.

The Limit of Cylinder Pressure.

Some facts of a special character were adduced at a late meeting of one of the British Societies, in support of a somewhat singular opinion—that the limit of advantage in the use of high pressure in expansion was reached at about 40 lb. per square inch, and that any increase of pressure beyond that was useless, and therefore, for various obvious reasons, disadvantageous. The statements made did not appear either clear or conclusive, and were not endorsed by the meeting. It was admitted that about 60 lb. pressure was the present practical limit employed, but no very distinct reason was assigned for stopping there, except that the makers had found by experience what they could do with that pressure, and felt safe in its use. In reply, it was urged by the author of the paper that this “finality” view as to the limits of pressure having been reached had no clear foundation, and in illustration some lengthy experts were read by him from the evidence of Donkin, Farey, Field, Taylor, and others, before a parliamentary committee in 1871, when the same sort of “finality” view then in the mouths of those engineers, affirmed that 4 lb. to 7 lb. per square inch was the utmost limit of pressure that should or could safely ever be used on board a ship. These quotations may have had the *ad captandam* merit of raising a laugh from the younger men present, but I cannot avoid questioning the good taste with which opinions, uttered fifty years ago—taken somewhat out of their surrounding—were made to throw ridicule upon some of the greatest mechanics of their day, whose real accuracy of thought and knowledge the proceedings quoted from most clearly show. It was pointed out by more than one speaker that the double-cylinder engine contained elements admitting of the boiler pressure being pushed further than with the single-cylinder engine, and it was stated by an eminent Liverpool maker that 60 lb. pressure was not deemed the limit of pressure, either theoretically or practically.—*The Engineer.*

Horseshoes.

The earliest horseshoe makers appear to have been Vandals and German tribes, in the graves of some of whom they have been found. They seem to have been totally unknown to the ancients. The first mention of them in literature is in the works of the Byzantine Emperor Leo, about a thousand years ago, by the name of “selenia”—half moons, or crescents. They are thus among the most modern of our everyday appliances. Before Leo’s time, cavalry horses were often disabled by the wearing out of their hoofs. The war horses mentioned by Job and other Scriptural writers were unshod. Receipts were given by Xenophon, Vegetius, and other writers, for hardening the hoof. The Japanese have for centuries used straw socks or shoes for the feet of horses traveling on stony roads. They wear out quickly but cost almost nothing, and can easily be repaired.

Horse shoeing was probably introduced into England by William the Conqueror. Henry de Ferrer (or Ferrers), who came with him, had six horseshoes quartered in his coat of arms, and is believed to have been superintendent of farriers.

The superstition which attributed a power over evil spirits to horseshoes, and which at one time prevailed so largely that most of the houses in the west of London had them nailed over the entrances, yet lingers. In many houses of the more ignorant classes in several countries they may be still be seen thus displayed.

It was reserved for an American, Henry Burden, of Troy, to contrive machinery whereby this most useful article could be prepared by machinery instead of by the tedious and laborious hand process that all nations up to the middle of this century employed.

SOLDERING IRON AND STEEL.—Dr. Sieburger publishes the following methods for soldering iron and steel: If large and thick pieces of iron and steel are to be joined, sheet copper or brass is placed between the perfectly clean surfaces to be united, which are then tightly wired together. The joint is covered with wet clay free from sand, and dried slowly near the fire. When the mud is dry the joint is heated by a blast to a white heat and cooled suddenly if iron, slowly, if steel. When brass is used, it requires less heat, of course, than copper. For objects of a moderate size hard brass solder is made by fusing together eight parts of brass and one part tin. Soft brass solder is composed of six parts brass, one part zinc, and one part tin. For soldering small iron or steel articles a hard silver solder composed of equal parts of fine silver and malleable brass is used, the mass being protected by borax. Soft silver solder differs from this only in the addition of 1-16 part tin. Very fine and delicate articles are soldered either with pure gold or a gold solder composed of one part gold, two parts silver, and three parts copper.

The Sand Blast.

The interest in the sand blast seems to be constantly increasing, as the sphere of its usefulness becomes more and more extended. Since the original patent was obtained by Mr. Tilligman in Oct. 1870, numerous devices have been patented on various contrivances for applying it to practical uses.

We give herewith a representation of one of the most simple ones, which is shown in operation upon an engraver’s table. A pattern or stencil has been prepared and placed upon the plate to be engraved, the plate being moved about on the “cushion” the exposed portions thereof are cut away by the falling sand, while that intended to stand in relief is protected from wear by the pattern.

Sometimes the tube, which conveys the blast is made flexible, in which case the stream of sand is guided over a fixed surface. The article to be engraved may be a silver cup, a watch case, a goblet or other articles. The sand consists of a mixture of corundum and emery. It is simply placed in a hopper a few feet overhead, and as fast as it runs down may be replaced in the hopper by hand. All the work, after the pattern is placed upon the article to be engraved, may be done by boys or girls.

A current of steam is sometimes introduced into the sand tube, which drives it with great

ENGRAVING BY THE SAND BLAST.

force for cutting rock, etc. With 100 lb pressure of steam, and a supply equal to 1½ horse power the cutting effect is found to be about 1½ in. of granite, 4 in. of marble, or 10 in. of soft sandstone per minute. The sand is introduced by a central tube of ½ in. bore, the steam issuing from an annular passage surrounding the sand tube.

An Important Application
Of the blast has been lately directed upon a block of brittle pitch or resin, on which a picture has been produced by photography, in gelatine, or drawn by hand in oil or gum. The bare surface of the resin is quickly cut away, leaving that portion covered by gelatine undisturbed. The material may be so cut away to a depth, which will allow of its being used as a matrix for an electrotpe, which can then be printed from an ordinary letter press. The lines left in relief will be well supported, their base being broader than their top, and there being no under cutting, as occurs in zincography, where the etching is done by acid.

The variety of uses to which the sand blast may be applied is constantly multiplying.

LUBRICATION WITHOUT FATTY MATTER.—It has been a long time the practice, with horologists to use graphite as a reducer of friction, in even the most delicate pieces of mechanism. In blowing engines, also, if the gearing is copper, graphite is the only lubrication used. These facts have led to the simple experiment of ascertaining the effect of a mixture of graphite—prepared by decantation—and hog’s lard, first in the stuffing-box of a pumping engine, and subsequently upon a steam engine. The result proved to be very satisfactory in the case, the only especial care requisite being to keep up the necessary quantity of graphite in the mixture, as otherwise it becomes too fluid. In another experiment, in which a paste of graphite and water was employed, the result proved equally effective; the slight escape of steam into the stuffing-box was sufficient to keep the graphite in a moist condition, and the lubrication seemed quite perfect, although there was no fatty matter present.

TINNING BY ELECTRICITY.—A new and important process of “tinning” by electricity has been brought into successful operation in Birmingham. By this process any metal, it appears, but zinc, can be coated with a very white metal of great brilliancy, of which tin forms the principal element. The precipitation is effected as in the electrotpe process. It is the intention of the company to tin in this way plates of iron and steel, and to use it as the layer upon which silver may be deposited, so that in ornamental articles, if the silver wear off, a pure white surface shall be still presented to the eye.

SCIENTIFIC PROGRESS.

Ozone and its Preparations.

Among the late developments of science and chemistry is the production of oxygen in a highly electro-negative state, in such quantities and form as to make it an article of commerce, to be used for refining and disinfecting purposes. In each case it is found far superior to chlorine, as used in the form of chloride of lime, as generally applied; the lime contributes but a small portion of the effect which it is desirable to produce, and it is used mainly on account of its affinity for chlorine, which makes it a good vehicle for carrying and maintaining the gas of chlorine, obtained from a mixture of sulphuric or muriatic acid and manganese, and it is entirely impracticable to make an article of commerce of chlorine on account of its powerful effect upon vessels, which might be made to contain it, of ordinary materials.

The apparatus used to manufacture it must be made of lead, and it will even oxidize them in a short time to such an extent as to destroy them, unless they are frequently cleansed or amalgamated with mercury. So that chlorine is an almost impractical agent for disinfection purposes, or for the treatment of oils, varnishes, etc., which are at first heavily charged with offensive and deleterious odors, and gases, except in the form of chloride of lime, and that, besides being an inconvenient form, foms an apparatus, and is not one time in ten, reliable in its strength. A substitute, therefore, for chlorine, which is available at all times in a simple form, and which is reliable in its action, is a very valuable agent, and this substitute is found in ozone.

As before stated, ozone is oxygen in a highly electro-negative state, and is produced by passing electric discharges through air and through oxygen. Houzeau’s plan of manufacture is the use of a narrow delivery tube, upon the interior of which is fixed a thread of copper, lead or platinum, one of the ends of which is passed out through a lateral orifice in the upper part of the tube, which orifice is closed with wax. Another thread of the same metal is rolled around the exterior of this tube, and the two threads are put in connection with an electric coil which gives off sparks two or three centimeters long, and immediately the oxygen of the air is converted into ozone. This agent can therefore be produced upon the premises, in manufactories or residences, with a cheap apparatus and at a small cost, and the air which is so strongly vitiated at times as to foster epidemics, can be completely sweetened and vitalized.

There are other means beside the one we have described, equally as simple, for ozonizing the oxygen of the air, as the principle is susceptible of several applications. Patents have recently been issued for an apparatus, and parties have engaged in its manufacture, at Washington, which apparatus it is intended to furnish for the use of private residences, manufactories, or towns and cities. It is expected that it can be applied the same as gas is furnished, in pipes, and at so trifling an expense that it will prove a luxury as cheap almost as air on the mountains. This is a step in science which cannot be valued too highly.—*Am. Manufacturer.*

NEW THEORY OF THE AURORA BOREALIS.—A German philosopher, Dr. Wolfort, has put forth a novel theory, claiming that the beautiful and seemingly erratic phenomena of the Northern Lights are due, not to electricity, but to reflected sunlight. The Doctor says: “The earth being conceived as a large mirror, many of the oblique incident rays will be reflected to a part of the celestial vault which is visible to the night side of the earth. The zodiacal light, an incomplete luminous ellipse, appearing in tropical skies before sunrise and after sunset, is probably thus formed; an irregular reflection of sunlight from water. Similarly, in case of the Northern Lights, the vast fields of ice in polar regions may be regarded as an imperfect mirror irregularly reflecting the incident light.” The new theory does not seem to meet with much favor among scientists for various reasons, among which it has been mentioned that the irregularity of the occurrence of the Aurora precludes the hypothesis of a cause regular in its action. Neither the great reflecting mirror—that is the icefields—changes materially from day to day, or even from month to month; nor does the sun’s light perceptibly vary. How is it, then, that Aurorae occur at exceedingly irregular intervals, and that a display of exceptional brilliancy is occasionally simultaneously observed over a whole hemisphere or nearly so? Another objection is the peculiar lustrous character of the display which so frequently inspires the admiration of the beholder, and is entirely inconsistent with the supposition of a reflector acting upon the sky its light borrowed from a constant and unvarying source. It is impossible, thus, reasonably, to explain the flickering, rapidly shifting forms and varying colors of the Aurora Borealis. Nothing in any way analogous has ever been elsewhere observed in reflected light. Besides, the points of the heavens at which the auroral forms sometimes show and group themselves, are impossible to any theory of reflected sunlight.

A New Idea in Wine Manufacture.

Dr. E. W. Sylvester, of New York, read a very interesting and suggestive paper before the American Institute Farmers’ Club on the 24th ult., wherein he endeavored to show the existence of an entirely new principle in the manufacture of wine—that the substance which we call alcohol is not produced by fermentation, but only by the *after process* of distillation. In other words that no alcohol, whatever, exists in pure, fermented wine until it is placed there by mixing therewith the products of distillation. He calls the fluid produced by the fermentative action of sugar on the juice of the grape, “fermentine” and we suppose, by purity of reasoning, the rule holds good in the fermentive changes of all other saccharine liquids. This fermentine becomes alcohol only on the application of heat sufficient to produce evaporation. Natural temperature, when high enough to cause a somewhat active evaporation, is sufficient to effect the change when in vessels not entirely filled. It is essentially different from alcohol in its effects on the human system and upon various substances in nature.

The Doctor compared the relative actions of fermentine and alcohol to the moderate eating of cloves, which only acts as a gentle stimulant, while the oil which may be obtained from the same quantity of cloves by distillation would produce almost instant death. The change takes place in the act of distillation—changing a harmless stimulant to a deadly poison. This gentle stimulating principle in cloves cannot be separated by any means now known to chemists. When it is sought for, it is converted into an entirely different substance, as is known from its effects. So it is with fermentine, which has never yet been seen pure and unmixed. But confidence is expressed that since the existence of the principle is now known and recognized, chemistry will eventually be able to isolate it.

It is well known to chemists that the same combination of elements does not always lead to the same results. Common illuminating gas, when pure, is identical with the oil of roses; yet it does not require a chemist to distinguish the flavor of the one from the other.

Fermentine, as taken moderately in pure wine, gently and healthfully excites the system, and has the power to restore the victim of a burning fever to natural action and vigorous health; while alcohol spends its whole force on the nervous system—breaking down and shattering instead of building up. Hence the Doctor concludes that no wines should be used which have had alcohol added to their bulk.

DETERMINATION OF SEX.—Professor Agassiz, who has given more new ideas, and furnished more food for the mind, more practical knowledge to the people of “these United States,” and all served up in the choicest and most interesting and easily-understood words and sentences; than any other man in the same years, recently made an address before the Am. Institute Farmers’ Club at New York, in which he said he would confine himself to one branch only, which should be the various functions connected with breeding. He startled his hearers by declaring that the time would come, though far in the future, when sex would be regulated and determined before birth. There were but two classes, the oviparous and viviparous, and in both cases the germ sprang from an egg, though in the latter the young were brought forth alive. His illustrations and delineations on the blackboard of the egg in the process of incubation were not less interesting than the developing changes in its incipient stages, previous to its becoming a germ. An egg is a live being struggling into its development, he said. The world needed observers.

FORMATION OF CLOUDS.—An English writer while criticising somewhat unfavorably Professor Poe’s new classification of clouds, remarks that in his opinion there are but three ways in which it is possible for clouds to be formed. These are, first, the cooling of a mass of air *in situ*, by radiation; this forms *stratus*. Second, the cooling of a mass of air by diminished pressure, when it flows in an ascending column; this forms *cumulus*. A modification of the process is when sudden expansion takes place above, so as to diminish the pressure through the entire height of the column of air, and, in consequence of the cold due to the diminution of pressure, produces condensation of vapor throughout the column. This is Eep’y’s explanation of water spouts. Third, the cooling of the mass of air by coming into contact with a cooler mass of air than itself; this forms *cirrus*.

AN ACCURATE ESTIMATE.—A curious illustration of the power of scientific prediction even on subjects by no means of a mathematical kind, has just been afforded us. In the memoirs of the Museum of Practical Geology, “Mineral statistics of the United Kingdom of Great Britain and Ireland, for the year 1871,” just published by Robert Hunt, Keeper of Mining Records, the consumption of coal, in 1871, is stated at 117,352,028 tons. In Professor Stanley Jevon’s book on *The Coal Question*, published more than seven years ago, he estimates the probable consumption of coal in Great Britain, for 1871, at 117,300,000 tons.—*London Spectator.*

sals for the purchase of another well-known mine in this district.

sals for the purchase of another well-known mine in this district.	tained when we state that the boxes run full all the time,
--	--

BRACKETT & Co.—This mine is across the gulch, opposite Duryea's, and has yielded a vast amount of the shining ore. The Co. after 5 years' steady labor, have worked out the lower portion of their claim and are now engaged in running a new tunnel higher up the ridge. They have worked out about 1,000 ft. in length of the channel, and fully as much more remains to be mined through the new tunnel. They have driven a distance of 160 ft. in solid ledge, and an additional hundred will take them through to gravel.

SIMPSON & Co.—Their claim is situated a short distance up the gulch. The main dume—34 ft. in length, 23 inches in the clear on the bottom and 28 on the top—is the handsomest piece of work of that kind ever put into a mine in this vicinity. They also have a branch dume 120 ft. long, similarly constructed. These gentlemen intend using 300 inches of water which will have a pressure of 230 ft. The bank is 80 ft. in height.

MOSEY, HARRINGTON & Co.—Their claim is located a short distance above Simpson's. The proprietors, are uncovering one of the best paying mines in the county. A vast amount of water is used in sweeping the debris away down the gulch, fully 2,000 inches being employed.

PERCIVAL, WALTERS & Co.—This claim is at the head of Spring Gulch, and is being got into splendid shape for working to advantage. They have a fine bank of gravel 50 ft. high, easily washed, and containing gold from top to bottom. They have 5 and 6 inch iron pipe, with a fall of 76 ft. 120 inches of water are used. The Co. have just laid down a new dume—16 inches wide on the bottom and 20 on the top—with a grade of 11 inches to the box.

WOLFEHNE.—This mine is developing into one of the best mines in the State. The main shaft has reached a depth of about 200 ft., uncovering a ledge over 4 ft. in thickness. The quartz taken out is unprecedentedly rich and improving in quality. Ore obtained in sinking this week appears to be masses of gold and sulphurates. Good judges estimate that the rock during the past week will average \$350 per ton—with a width of over 4 ft. The five stamp battery on the mine is kept constantly in operation.

WEST POINT DISTRICT.—The unexpected strike of rich ore in one of the tunnels of the Lone Star, alluded to last week, has widened to 6 ft. Coarse, free gold, can be seen in generous quantities, on the face of the tunnel.—Judge Beeler's mine shows ore worth \$90 per ton.—Griggs & Co. are dumping some very healthy ore, at Camp Espirito. The hoisting works of the Ohio Cons. are rapidly approaching completion—Jose de Vella & Co. are working a good sized vein, near the North Fork, with excellent results.

GWIN.—Thirty-six stamps are now in operation, yielding an average of \$1,000 per day. The rock in the 500 and 600-ft. levels is high grade and improving as work progresses.

CAMPO SECO.—Calaveras Citizen, Jan. 18: The Sim's claim is still progressing—they are tunnelling, to strike the lead, and will soon commence sinking the old shaft, which is on the lead and known to be rich. The Spencer mine is down 100 ft., in sinking, the shaft was put down straight, leaving the lead some 10 ft. to the east—drifting to strike the vein and will have a good thing when they do, as the rock was rich on top.

SCOFFIELD.—The shaft is down 112 ft., and the rock richer than ever.

ROSE HILL.—This mine, belonging to Mr. Rhodocini, near El Dorado, has commenced crushing again. Ten stamps are running.

KERN COUNTY.

PI UTE.—Havilah Miner, Jan. 11: Mr. O. M. Cummings has been the lucky discoverer of half a dozen ledges in as many months, some of which, upon being developed, have proven to be very rich. The Goldsmith Maid is a large vein; a cut has been run 12 ft. across it without having found either wall. Maria Louise is located a quarter of a mile from the Goldsmith Maid, prospects very rich and is a large ledge. The Oneida Chief is 5 ft. thick and some of the rock prospects as high as \$150 per ton. These mines are all located in this vicinity of the Bright Star mine, which is one of the richest in the county.

MILLS.—Jan. 18: The mills at Kernville, Sageland, Pi Ute and Havilah are running night and day, and more would start up if we had miners to get out the quartz.

The Joe Walker mill will commence crushing rock taken from the Cumberland, in a few days. This mine is a quarter of a mile from the Joe Walker, the rock is very rich, and there is plenty of it.

DISCOVERY.—Paul Pledger has discovered a very rich quartz lead just south of the McKeadey mine. The ledge has been stripped for over 300 ft. on the surface, and is from 1 to 4 ft. in width; the rock prospects, on an average, \$80 per ton. There are over 1,000 tons of ore in sight.

NEVADA COUNTY.

PICATUNE.—Grass Valley Union, Jan. 15: We learn that William Combs & Co. have struck good pay in their claims at Randolph Flat. To reach the gravel bed they commenced operations at Lone Rock Cañon, and run an open cut 800 ft. long and 8 to 10 ft. deep, then excavated the cut to the width of 30 ft. and to the depth of 10 to 12 ft., for a dump; then run a timbered cut 125 ft. in length and 12 to 20 ft. deep, at which point they commenced their tunnel through the run of the basin to a chute in depth 50 ft. under the surface; then continued

the tunnel 550 ft through and under ground, at which point they struck good pay. At about 450 ft. from the mouth of the tunnel a drift 90 ft. long and 8 ft. wide was run easterly in gravel, which yielded a profit over labor in running of \$275. A second drift, near the end of their tunnel, was run easterly 90 ft. in length and 15 in width, the profits over expenses in running which was \$325. They have also run a middle drift between the two above mentioned to work a block of ground which is estimated will pay at least \$1,500, and which can be worked at an outlay of \$450. In addition to the drifts easterly, a drift 40 feet long has been run westerly from the tunnel, and in neither of the drifts has the end of the gravel been reached.

MINING ITEMS.—Jan. 17: We understand that the North Star has struck rich rock in the new shaft. The ledge in the new shaft is from 10 to 12 inches in thickness and shows well in free gold and sulphurates.

IRON.—Yesterday a party of gentlemen left this place for the purpose of getting samples of iron ore from at large ledge. The ledge, it is said, will yield about 70 per cent. of iron.

DAMS OF GOLD.—Jan. 21: The Idaho cleaned up, last Saturday, gold to the value of \$22,000, after a run of 6 days. The preceding 6 days run of the same mill gave \$19,950. The batteries of the mill were not cleaned up in either case, but only the amalgamators were skinned. Twelve days skimming from 35 stamps, worth \$41,950 make a good showing.

The Empire cleaned up after 10 days run with 20 stamps, gold worth \$6,500.

The Europa with 10 stamps for 6 days, cleaned up about \$10,000. The clean up was from the amalgamators.

Daisy Hill is having gold pounded out of ore which judges of the article say will not yield less than \$50 a ton.

The Slate Ledge Co. (Perrins') is crushing a run of 30 loads of rock and the plate of the mill, after 4 days run, have been cleaned up. The plates gave gold worth \$1,500.

LANZANIA.—Nevada Transcript, Jan. 26: This Company having completed their powder drift of 80 ft., and run their T of 49 ft. each way from the head of the drift, yesterday afternoon let off a blast of 6,250 pounds of powder, or 250 kegs. The ground was shattered and broken up for a considerable distance, and millions of tons of gravel were broken up. Monday next a thousand inches of water is to be turned loose into this gravel bank, under a pressure of over 200 ft.

GOLD TUNNEL MINE.—This mine, situated just below town, which during the past 20 years has seen its ups and downs, has, for the last 18 months been under the charge of Harvey Helm, who has worked for the purpose of finding, a regular, well defined paying ledge. After a large outlay of money, in the purchase of machinery, labor, tools, etc., the prospect up to within the past week was anything but encouraging. He has at last been successful, having encountered a large, well defined ledge, from 4 to 5 ft. thick.

PLACER COUNTY.

CRATER HILL.—Placer Herald, Jan. 18: During the past week the Crater Hill quartz mine was sold to the St. Patrick Mill and Mining Co. for \$10,400. The mine is located about one-half mile northwest of the St. Patrick mill, some 3 miles west of here, in the Ophir mining district. It was worked some years ago, and though it was done in a very careless and slovenly manner, and in an old, rickety water mill, there was assayed from it here, in Auburn, something near \$40,000 in 14 months. The claim embraces 600 ft. each on three parallel ledges, making 1,800 ft. in all.

SIERRA COUNTY.

NEW YORK.—Downville Messenger, Jan. 18: The recent rain furnishing water for washing up the drift dirt which has been accumulating in the dump-house, and the yield is about \$10 per day per man.

DIVIDENDS.—The Bald Mountain Co., of Forest City, recently declared a dividend of \$1,000 per share, and this from their first clean up. The Kate Hardy Quartz Co. of Forest City have declared their first dividend.

TUOLUMNE COUNTY.

FORTUNATO CONSOLIDATED MINING CO.—Tuolumne Independent, Jan. 13: This Co. will at once commence operations on the mine which has been in their corporation, located on the 3 miles east of Columbia. The first "Mina Ore" is located near the Jones & Woodman mine. The "Buena Ventura" is on the trail to Italian Bar, parallel with and from 300 to 500 ft. from the "Mina Verda," and prospects well. The "Guardian" is near and southwest from the "Mina Verda." The Co. will contract to sink shafts to the depth of 150 ft. on each vein, and will expend some \$15,000 in prospecting the ledges.

ITEMS.—The Quartz Mountain mines are again in full blast. The Kincaid Flat Tunnel is reported to be completed, or nearly so. Mining has commenced at Columbia and vicinity with plenty of water. J. Gillis & Co. have bonded their valuable mines at Jackass Hill, to a S. F. Co. The water is being fast pumped out of the Sausky mine, in preparation for the employment of 100 men.

Nevada.

ELY DISTRICT.

ALPS.—Pioche Record, Jan. 11: This mine has been yielding admirably of late. Already this month bullion has been produced from it to the amount of \$43,364.75. The last shipment made last Friday morning, and it amounted to \$6,443.13. From 5 to 8 tons of high-grade ore is being brought up daily. The vein from which it is taken is irregular in width, never falling below 18 inches, and not unfrequently widening to 32. The east drift is greatly improving, while the west maintains its average richness.

THE WINE.—The wine that was sunk from the 100 ft. station has now reached a depth of 60 ft. The ledge shows 2 ft. in width, and the ore is of a free, rich character. The base metal that first presented itself in the mine has entirely disappeared.

CRESCENT.—This mine, one of the oldest locations in Ely District, is situated east of the American Flag, and about 200 ft. west of the Sunbeam. The shaft is inclined and has a depth of 75 ft. A streak of mineral and ledge matter has shown about a foot in width to the present depth, and is gradually widening.

SILVER PEAK.—The incline is now down 155 ft. We were shown the assayer's certificate of ore from the bottom of the incline, which retorted \$188.50 to the ton; it was an assay, however, of selected rock.

THE WINE OF THE HILL.—The aggregate shipments from this mine, during the months of Oct., Nov. and Dec., have been something over \$45,000. The main shaft is now 50 ft. below the Burke tunnel, and drifts are being run both ways. There is about 50 tons of ore at the dump, and from 4 to 5 tons is being hoisted daily. Battery assays return an average of \$145 to the ton, and about 60 per cent. of which is realized in bullion.

TAMAMIA.—The incline is now down 70 ft., at which depth the vein is from 10 to 14 inches wide, and the ore is low-grade. The walls are regular, and thickly covered with "stickensides."

PEAVINE.—The main shaft is now 200 ft. in depth, at which point rock having metalliferous has been struck. The mine started in through it. The ore for the last 20 ft. has been very rich, but the vein is very narrow.

GRAY & BISHOP.—The Co. are running a drift northerly from the 250-ft. level, and have drifted 30 ft. through ledge matter without striking the hanging wall.

PIOCHE.—All is activity below, about 5 tons of ore are being hoisted daily, which is being constantly freighted to the Magnet Mill. There are now about 125 tons ahead of the hill, all classed as high-grade ore.

PIOCHE WEST.—Work has been resumed on this mine. Prospects fair. Main shaft 300 ft. deep.

FLORAL MILL.—The foundation for the drying kiln is being constructed, and preparations are being made for the raising of the heavy sleet iron smoke stack. The stamps, pans, settlers, engine, boilers, etc., are all placed in position, and the heaviest and most expensive work has been completed. Some 600 tons of ore are already at the mill ready for treatment; 600 cords of wood on the ground, and a large tank, filled with water, being supplied with the same through pipes from a spring in the mountain not far distant.

STANBARD.—Jan. 10: This mine is located between the American Flag and the Sunbeam. On Monday a vein 4 ft. wide was struck, from which ore assaying from \$200 to \$381 per ton was taken.

HUMBOLDT.

BOLIVIA DISTRICT.—Silver State, Jan. 18: We understand that 4 mining companies have commenced operations. The copper ore of that locality are said to contain a higher percentage of metal than any before discovered in the State. Rich silver ores have recently been discovered in the vicinity of the copper mines.

EMERY.—The owners of the Emery ledge report a two-foot vein of excellent ore in the bottom of the shaft. They have 40 tons of ore on the dump, some of which they are assaying for shipment to the Humboldt Reduction works, or San Francisco.

BULLION.—The amount of bullion shipped from Arizona through W. F. & Co., since our last issue, was \$8,245; and from the Henning, \$800.

Humboldt Register, Jan. 18: There were nearly \$5,000 worth of fine bullion shipped from Humboldt Canal Reduction works at this place, last week.

REESE RIVER.

S. C. BAKER.—Reese River Revue, Jan. 18: The ledge is 15 inches thick and the ore is estimated to be worth \$2,000 per ton.

BEACON.—Monitor Co., Still stopping above the main tunnel level. The fine breast of black metal still holds its own as the work goes on; also taking splendid ore from the lower stops.

EL DORADO SOUTH CON.—The immense ore deposit lately discovered in the south incline 200 ft. south of the hoisting works seems to be the greatest discovery of rich ore ever made in this section. The wall has been followed some 15 ft. from the top of the ore, now measures over 15 ft. and the walls still widening. The ore in this body is pure chloride and horn silver, and the rich heavy flakes seen from wall to wall astonish all who have examined this wonderful deposit. There is ore enough in sight in this body as far as opened into, to turn the company's mill steadily for 12 months.

COMBINATION CO.—The lessees of this Co.'s ground have just finished assaying up the ore extracted under their lease. They estimate to have about 30 tons of first-class ore which will yield \$400 per ton, and about 300 tons of second-class ore which will yield \$200 per ton. The ore is piled up, awaiting an opportunity for reduction in our mills here, but there seems little hope of the mills here being able to do custom work while they have so much work of their own on hand.

WASHOE.

PROSPECTING.—Gold Hill News, Jan. 14: Five or six miles east of Virginia, scattered over the hills on either side of the mouth of Six-mile canon, can be found many pieces of float quartz extremely rich in both silver and gold. A number of men are now engaged in collecting together this float for the purpose of having it crushed, and at the same time find its source, if possible.

DISCOVERY.—Jan. 14: Fourteen miles in an easterly direction from Virginia City, in the eastern foothills of the Washoe range of mountains, near the eastern line of Storey county, is situated what is known as the Golden Eagle Mining Co.'s claim. About four weeks ago, they had stripped the ledge 12 ft. in length, and the sink hole, and what is left, seen from the side, exposing the full face of the ledge to that depth, which, to all appearances, showed a fine deposit of good ore. From the hole sunk samples of ore assayed from \$23 to \$162 per ton, mostly in silver. On the 1st of January the ledge in the shaft at a depth of 30 ft. had increased to 5 ft. in width, and three assays of the ore gave from \$4.93 to \$93.30 per ton, mostly silver.

RICK ORG FOUNTAIN.—Jan. 17: A gentleman to-day exhibited in Virginia some very rich float rock, found somewhere on the line of the Sutro Tunnel. It is gold-bearing quartz, and an abundance of the precious stuff is visible to the naked eye. The specimens of "float" found thus far assay from \$400 to \$1,000.

LOCAL CLAIMS.—The quartz of a number of claims have been located on the range in which the float rock, mentioned by us a day or two since, is found. A gentleman who has been on the ground informs us that the same character of float as that found on the original location occurs along the foot-hills bordering on the valley of the Carson for a distance of two miles. Boulders of quartz several tons in weight are found, which show fine gold, and what is left, seen from the side, exposing the full face of the ledge to that depth, which, to all appearances, showed a fine deposit of good ore. The first locators are about to commence operations looking to the discovery of the ore in place. They will begin by running a deep cut or trench back into the hill, starting at a point where the float disappears under the debris from the face of the hill.

BELCHER.—Daily yield 330 tons, from the 1000 and 1100-ft. levels, both of which producing sections never looked better. The 1200-ft. level is looking finely. The main drift south, at this level, is now in 254 ft. The winze from the 1100 to the 1200-ft. level, 200 ft. south of the Crown Point line, is fully completed and in excellent ore all the way. The main incline is now down 40 ft. below the 1200 ft. level. The main drift east from the incline, at the 1000-ft. level is in 305 ft., at the drift, and the 850 ft. level is in 115 ft. at the drift.

CROWN POINT.—Daily yield about 400 tons, from the 1100, 1200 and 1300-ft. levels. Last Tuesday night, one shift of men, trying to see what they could do, sent up 360 car loads in six hours and a half from the 1100 ft. level—about a car-load a minute—each load of ore weighing 1200 lbs. The powerful hoisting facilities and double cage arrangements of the mine enabled them to do this, being the first time that line ever before performed on the Comstock. The ore-dumps are full. The connection between the north and south drifts at the 1300-ft. level being fully completed, that level is now cool and comfortable as any other level in the mine, and it is opened through from the incline to within 15 ft. level of the Belcher line. The 1300 ft. level will evidently prove to be the best in the mine. Assays from it average about \$175 to the ton. The cross-cut east is in 115 ft., still in fair ore, with no indication of east wall. The main incline is now about down to the 1400-ft. level.

CALEDONIA.—The main north drift on the 400-ft. level of the new works is still driven directly ahead, having passed through the 350 ft. level, and is now at the 150 ft. level, apparently leaving the principal body of ore at this point to the left. The main drift south on the 400 ft.-level of the new shaft is making good progress.

CHOLLAR POTOMI.—Daily yield 120 tons of ore, the assay value of which is \$32 per ton! The body of ore recently opened by the northwest drift at the first station is yielding finely, and prospecting drifts at the 750 and 850 ft. stations making good headway.

GOULD & CURRY.—The incline is down 120 ft. below the 1600-ft. level, making fair progress, though the rock in the bottom is very hard and requires continual blasting.

HALE & NORCROSS.—The station at the 1700-ft. level is opened, and two chutes, one for the ore and the other for waste, are being fast approaching completion. The chutes are being constructed on a much-improved plan, by beginning some 150 ft. away from the shaft, and opening a large incline to the shaft, capable of holding, if necessary, several hundred tons of ore at a time, easing much of the bother and trouble often occasioned by the old and narrow-contracted style. The engine-wince from the north drift to the 1700-ft. level is in 115 ft. at the 1700 ft. level. A new feature, and one that appears to work well and be a great saving of both time and ex-

pense, has been introduced, viz.: that of establishing a blower to be run by a small steam engine on the 1600-ft. level of the mine, thus entirely doing away with the expense and power necessary to force the air down to that level.

KNICKERBOCKER.—Operations still confined to the gloaming of the old workings about the 500 and 600-ft. levels.

OVERMAN.—Notwithstanding the steady and continued operation of both the pump and water tanks, the work of draining the shaft is making slow progress. Over 50,000 gallons of water per hour is being hoisted, with strong indications of the supply slowly though gradually weakening.

SAVAGE.—Daily yield over 145 tons of ore worth \$23 per ton. The incline, the main south drift on the 1,600-ft. level and the main drift north to connect with the south drift from the Gould & Curry are making good progress.

VIRGINIA CONS.—The shaft is down 130 ft. below the 500-ft. level, the rock in the bottom continuing to work well. The main north drift on the 1,167-ft. level from the Gould & Curry shaft, is still driven ahead.

YELLOW JACKET.—The lowest or 1,300-ft. level being drained of water, drifting east for the ledge is resumed from the incline. This drift is now in about 100 ft. At the 1,400 ft. level the east drift is nearly 100 ft. into the ledge matter, but the face is in barren quartz and periphery. The Comstock lode is over 300 ft. wide at this level. Drifting north and cross-cutting east at the 1,300-ft. level.

ARIZONA AND UTAH.—The heavy body of water tapped in the shaft during the fore part of the week has caused an entire suspension of that part of the work at present. A drift at the 250-ft. level to connect with another at the same level from the Globe tunnel has just been commenced.

JULIA.—Cutting out for a new station, at the 1,000-ft. level, is making good progress. The main east drift on the 800-ft. level, is in 403 ft. the face still in low grade ore.

KNICKERBOCKER.—The main west drift is in 500 ft. the face being in a mixture of quartz and porphyry.

INSURANCE.—The incline is down 105 ft. below the tunnel level, the rock in the bottom working quite hard.

BALTIMORE CONS.—A very favorable, yet not unexpected change has taken place in the prospects of the mine during the past week. The drift for the ledge, at the 250-ft. level, is in 240 ft.; it passed through clay. Yesterday it cut through this clay wall into ledge matter, being a mixture of quartz and clay, from which came a strong flow of water, which taxed the pumping and hoisting facilities of the company to the utmost at first, but it is fast subsiding. Some of the quartz from the face of the drift gives good assays, encouraging the hope that a good body of ore may be near by.

BUCKEYE.—This mine is turning out about 30 tons of ore per day, the assay value of which is nearly \$20 per ton, keeping both mills of the company steadily running. The ore stops, both south and north of the incline are looking splendidly.

SILVER HILL.—The shaft is down 105 ft. below the first station, the entire shaft in quartz and low grade ore. A new station at this point is being opened as rapidly as the necessary timbers can be procured. The main south drift is still driven ahead the face in good ore. The main drift north is pressed ahead to strike the chimney of ore found in the old upper workings.

UNION CONS.—The northeast drift on the east side of the ledge, is in 57 ft., the face still in low grade ore.

Utah.

SATURN FURNACE.—Salt Lake Tribune, Jan. 10: Situated at Sandy Station, is making a very successful run with 2 cupolas, turning out iron from 10 to 12 tons of bullion daily.

SPRINGTOWN DIS.—SILVER KING.—This mine is situated 12 miles northeast of this town. There is a tunnel a distance of 125 ft. following the ledge. At a point 100 ft. from the mouth of the tunnel, there is a shaft sunk to the depth of 97 ft. that runs in mineral, though the ledge appears to be broken in places. At the bottom of this shaft there is another tunnel run 65 ft., and a shaft sunk from the back end to the depth of 65 ft. The character of the ore is galena, carbonate and is 25 in silver to the ton, and yields 40 per cent. lead.

GRAND CROES.—The tunnel is in a distance of 183 ft. and from thence there is an incline shaft sunk 55 ft. deep. From the bottom of this incline a tunnel is run westerly 50 ft. There can be seen a well formed ledge 32 inches thick, encased between two walls, perfect in appearance. I am told by one of the owners of this mine that the ore is worth \$50 in silver to the ton, and that it carries 55 per cent. lead. Character of ore is mostly galena, though mixed with carbonate.

DEFANCE.—Tunnel in 75 ft. and passes through the location made by the I. X. L. company. From the back end of this tunnel there is an incline sunk to the depth of 30 ft., which shows about 1 ft. of galena and carbonate. I am told, I am told, \$30 in silver to the ton, and carries 50 per cent. of lead.

MUSCATINE.—Situated 2 miles to the southeast of this town. The incline shaft in this mine is down 35 ft. and shows 3 ft. of ore, the character of which is mostly carbonate with some galena mixed. I am told by some of the owners that this ore is worth \$50 to the ton in silver and carries 60 per cent. of lead.

GREAT BASIN.—Tunnel is in 70 ft. and an incline is sunk from the back end 30 ft. deep. In this incline there appears to be about 2 1/2 ft. of ore, mostly carbonate, that I am told, is worth \$40 to the ton in silver, and carries 50 per cent. lead.

QUANDARY CO.—The shaft in this mine is down 110 ft., follows the ledge down, and pitches to the north on an angle of 10 degs., the direction of this ledge being east and west. At the bottom of this shaft there are two drifts run, one following the ledge 30 ft. east, and the other the same distance west. At the back end of the last named drift there appears to be a large body of ore, though the parties have not, as yet, drifted through it. In the east drift there is, perhaps, 2 ft. of ore in sight. The character of the ore is carbonate, with a small percentage of galena mixed, and is said to be worth from \$70 to \$80 in silver to the ton, and carries 50 per cent. of lead.

OUR FRIZ.—Location embraces \$1,000 ft. The shaft shows a vein about 18 inches thick. I understand that 5 tons of this ore were worked at Jacobs & Co.'s furnace, in this town, yielded \$81 in silver to the ton, and 50 per cent. lead.

MONO.—Cor. Utah Mining Journal, Jan. 14: The incline shaft is down 308 ft., has 5 drifts run on the right hand side in approaching the bottom of the incline, and 3 on the left. The average distance that each drift is run, is about 30 ft., making the whole distance prospected about 60 ft. This ledge is situated in a limestone formation. The character of the ore is horn-silver, black sulphurates, carbonate and galena mixed, and is said to be worth more than this ore taken from any other mine in the Territory. The company have on hand about 20 tons of high grade ore, that they think will sample \$3,000 to the ton. Also about 25 to 30 tons of second class that is worth from \$250 to \$300 per ton. The average thickness of the ledge is about 3 ft.

UTAH QUEEN.—The incline shaft is down 140 ft., and thence from the bottom of this incline, there is a tunnel run 100 ft. Thirty feet from the bottom of this tunnel there is a slope running upwards of 25 or 30 ft., that connects this tunnel with another tunnel running from the Converse shaft. The general average for thickness of ledge—for all the work done—is about 3 ft. The character of this ore is argenteriferous carbonate and oxides of lead, and is worth about \$100 to the ton on general average.

FRANKS.—Seventy-five ft. from the mouth of the incline there are chamber sets in, that appears to extend downward 50 ft., and is 30 ft. wide by 20 ft. deep. From this ore chamber, I understand, there has been a large quantity of high grade ore taken. From the lower end of the chamber there is a shaft sunk, following the ledge a distance of 220 ft. The character of ore is horn and native silver, and grey and green chlorides, carrying 5 per cent. of lead.

Mineral Land Decision.

Pre-emption Claims not Good Against Subsequent Mining Discoveries.

A decision of wide scope and great importance has just been rendered by the Acting Secretary of the Interior, on an appeal from the Sacramento Land District, involving the validity of a pre-emption claim to land thus settled upon before the approval of the Act of July 26, 1866, but subsequently discovered to be mineral. The regular Washington correspondent of the *Bulletin* writes as follows to that paper:

The following correspondence exhibits the full nature of the controversy and the reason on which the decision of this department has been based:

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE, August 6, 1872.
Register and Receiver, Sacramento, Cal.
GENTLEMEN: The papers and testimony submitted with your letter of June 17th, 1872, have been examined. The only question presented is in regard to the mineral or non-mineral character of the South West quarter of the South West quarter of Section 31, T. 10 W., R. 10 E., and the N. W. 1/4 of the N. W. 1/4 of Section 6, T. 9 W., R. 10 E., Mount Diablo Meridian.

On the 21st of December, 1870, Ekin Smith filed D. S. No. 2,282, upon lot 2 of N. W. 1/4, and lots 3 and 4 of the S. W. 1/4, of Sec. 31, T. 10 N. R., 10 E., and lot 4 of N. W. 1/4, Sec. 6, T. 9 N., R. 10 E., Mt. Diablo, Meridian. On the 12th of July, 1871, Thomas Stewart filed in your office an affidavit alleging the mineral character of this S. W. quarter of the S. W. 1/4 of said Section 31, and the N. W. 1/4 of the N. W. 1/4 of said Sec. 6. You fixed upon the 24th of October, 1871, as the day of hearing, and cited said Stewart to appear and offer proof as to the character of said land. Upon the evidence submitted at said hearing, you decided first, that the land in dispute is agricultural; and, second, that the pre-emption claimant, Ekin Smith, was settled upon the land, and had acquired a pre-emption right thereto prior to the passage of the Act of Congress, entitled "An Act granting the right of way," etc., approved July 26, 1866; that down to the time of the passage of said Act of Congress, no valuable mine had been discovered on said land; that said claimant has continuously resided upon and cultivated and improved said land since his first settlement, and complied with all the provisions of the pre-emption laws; and that therefore he would be entitled to enter said land, even though a mine had been discovered thereon since the passage of said Act of Congress above referred to.

In support of this decision you refer to the 10th section of the Act of July 26, 1866, and state that the law says "that whenever, prior to the passage of this Act, * * * there have been homesteads made, etc., * * * upon lands upon which there have been no valuable mines discovered, the settlers shall have a right of pre-emption thereto."

Upon a careful examination of the evidence, this office is of the opinion that the testimony taken at said hearing establishes the mineral character of the land in dispute, and this portion of your decision is therefore reversed.

The 10th section of the Act of Congress, approved July 26, 1866, was not correctly quoted in your decision, and the conclusions which you arrived at are not correct nor in accordance with the law itself.

The 10th section of said Act reads: "That whenever prior to the passage of this Act, upon the lands heretofore designated as mineral lands which have been excluded from survey and sale, there have been homesteads made by citizens of the United States, or persons who have declared their intention to become citizens, which homesteads have been made, improved and used for agricultural purposes, and upon which there have been no valuable mines of gold, silver, cinnabar, or copper discovered, and which are properly agricultural lands. Said settlers or owners of such homesteads, shall have a right of pre-emption thereto," etc.; and the eleventh section of said Act declares "That upon the survey of the lands aforesaid, the Secretary of the Interior may designate and set apart such portions of the said lands as are clearly agricultural lands, which lands shall thereafter be subject to pre-emption and sale as other public lands of the United States, and subject to all the laws and regulations applicable to the same."

It is clear from the language of this statute that Congress did not intend to abolish or do away with the distinction between mineral and agricultural lands, or to allow mineral lands to be classed and disposed of as agricultural; but it simply provided that the public surveys might be extended over a region that was so clearly mineral in character that it had previously to the passage of said Act of Congress been reserved for mineral purposes and that such tracts as should appear to be properly and clearly agricultural might be disposed of under the laws applicable to agricultural lands.

Said section gives no rights, in other words to agricultural claimants, except to such lands as are clearly and properly agricultural. If the theory advocated by you in said decision was to be received as the proper construction of said Act of Congress of July 26, 1866, the law would be a nullity, and patents could only issue for such mining claims as had been discovered prior to July 26, 1866.

This portion of your decision is also reversed. You will inform all parties in interest of this decision, allowing sixty days from the date of

your notification in which an appeal may be taken to the Hon. Secretary of the Interior.

Please acknowledge this receipt hereof.

WILLIS DRUMMOND, Commissioner.

Letter From the Acting Secretary of the Interior—Commissioner Drummond's Decision Affirmed.

DEPARTMENT OF THE INTERIOR
WASHINGTON, D. C., December 17, 1872.
Hon. Willis Drummond, Commissioner General Land Office:

SIR—I have examined the case of Ekin Smith vs. Absalom Stewart, involving the right of said Smith to enter under this pre-emption law, as agricultural land, the southwest quarter of the southwest quarter section 31, T. 10 N. R. 10 E., and northwest quarter of northwest quarter section 6, T. 9 N. R. 10, E. M. D. M., California, on appeal from your decision of August 6, 1872.

Two questions are presented on appeal: One relating to the character of the land claimed; the other calling for a construction of the tenth section of the Mineral Act of July 26, 1866 (14 Statute, 253), on both of which questions your decision was adverse to the pre-emption claimant. After a careful review of the voluminous testimony taken before the local officers, I am satisfied that the land in controversy is mineral in character and should be held for disposition under the Mining Statutes. It is claimed on behalf of the pre-emption claimant that the 10th section of the Act of 1866 gave to qualified persons who had prior to the passage of said Act made homesteads on lands theretofore designated as mineral and excluded from survey and sale, a right of pre-emption or homestead therein, unless before the passage of said Act valuable mines of gold, silver, cinnabar or copper, had been discovered thereon, and further, that the subsequent discovery of such mines did not affect the right of pre-emption or homestead thus acquired. I fully agree with you that this is not the proper construction to be given to the Act referred to. Congress did not, I think, intend in this Act to do away with well established distinction, so long recognized by legislation, between agricultural and mineral lands, or to allow lands actually mineral to be acquired under agricultural laws. I think the object of the tenth section was to give to persons who had in good faith, made agricultural settlement on public land theretofore designated as mineral, but subsequently to be agricultural, a preference in pre-empting or entering the land as homesteads over those admitted to similar right by the eleventh section.

The department has heretofore given this construction to the Act in question by approving your instructions of December 2d and 7th, 1871, and March 20, 1872, to the Register and Receiver at Stockton, California, directing the withdrawal from disposition, under agricultural laws, of certain lands theretofore classed as agricultural, until the non-mineral character of the same should be affirmatively established. I therefore affirm your decision, and return herewith the papers transmitted with your letter of the 26th ultimo. Very respectfully,

B. R. COWEN, Acting Secretary.

Another Important Decision—Local Errors of Record do not Vitalize Selections of Land Actually Made by the State Under the Internal Improvement Act.

The Secretary of the Interior to-day decided in a case appealed from Solano county, California, that the right of the State attached to a certain "selection" made in December, 1853, under the Internal Improvement Act and was not impaired by the failure of the Register to transmit a proper record of the selection to the General Land Office.

SINGULAR STONE.—The Sacramento Union describes a curiosity found in a bed of gravel in that city, fourteen feet below the surface, while the discoverer was digging a well. It is composed of rock, hard as flint, dark green in color, with white specks, perfectly round and smooth, about 3 1/2 inches in length, about an inch in diameter in the center, and tapering to a point at either end. About half an inch from one end a hole has been drilled through it and a groove cut from the hole around the end of the stone, as if it was intended to pass a line through the hole and suspend the stone by it. The rock, however, is so excessively hard that it is almost impossible to scratch it, and the question therefore arises as to what sort of an instrument the aborigine that did the drilling—which was probably performed hundreds of years ago—used.

A MR. JENKINS, of Atchison, Kansas, has patented a new method of tempering steel. The *Champion* says in regard to it: "After heating a piece of steel to a white heat, and putting it in the tempering box, every ordinary attempt to break it was unavailing, while on the other hand, a piece of the same material, tempered in the ordinary way, and with the same effort to break it, was shivered in a dozen pieces." Mr. Jenkins has also patented a new method of working scrap-iron into certain manufactured articles; at a saving, it is claimed, of about 50 per cent. to the manufacturer.

A COPPER vacuum pan was recently constructed for an English sugar refinery costing £2,500, and being twelve and one half feet in diameter and thirteen feet deep. In it twenty-seven tons of moist sugar could be boiled in two and one half hours.

THE Cambria Iron Company has opened a night-school in the Third ward, Johnstown, Pa., for the education of boys who are employed at work in the mines. A noble work, and one that should be imitated everywhere.

The Curious in Nature.

In previous numbers of the PRESS we have, from time to time, given illustrations and short bits of natural history setting forth the peculiar traits or habits of instinct or reason, call it what we will, of some of the smaller of the animal creation, whereby they are enabled to construct their peculiar habitations or provide themselves with food in some remarkable manner.

We have given the ant-lion; ants at homes; carpenter-bee; tailor-bird, etc., and now we continue the series by introducing a short history of the

Archer Fish.

This little fish, seldom exceeding six inches in length, is known to naturalists as the *Toxotes jaculator*, found in some of the fresh waters of Java and a few of the other India islands. Its appearance would indicate nothing remarkable except a slight peculiarity of form, compared with most fishes. But that which gives it peculiar interest is the manner it procures its food. It lives upon flies and other winged insects that swarm among the aquatic plants of the waters it inhabits.

Instead of leaping from the water for its prey, which few fish can do to more than once or twice their length above the surface, this little artilleryman brings its mouth only to the surface and there ejects or shoots, a single drop of water from its throat and mouth, with unerring aim, and with such force as to disable and knock down into the water any fly or insect that—as a sportsman would say—"it draws a bead on," when it becomes an easy prey.

The artilleryman—for this is a more appropriate name than archer, as it uses neither bow

THE ARCHER.

nor arrow—is easily domesticated and seems to delight in showing its powers, for which reason it is often kept as a pet, in large open vases, and loses no opportunity in throwing its shot at any unfortunate fly presenting itself, or forced within its reach; its aim is almost unerring at any distance less than three feet, and the effect perfectly stunning.

Blowpipe Analysis for Practical Men.

A very useful scheme for the qualitative determination of substances by the blowpipe has been arranged by Prof. T. Egleston, M. E., of Columbia College School of Mines, New York, and published in the *American Chemist*. He states that in the course of his instruction in blowpipe-analysis he formerly found great difficulty in teaching the students how to distinguish with certainty the substances contained in a mixture of four or five ingredients, more particularly when the most of these were metals. The old routine method of examination on charcoal, then in the closed and open tube, etc., answered very well when not more than one or two metals were present, but did not seem to answer in the hands of beginners when they came to examine alloys of complex composition. For a long time he was convinced that it was quite useless to expect of a student that he should be able, without extended practice, to determine qualitatively the composition of a very complex substance. It finally suggested itself to him that a plan similar to the one used in certain quantitative assays would answer for the general outline of qualitative work. He, therefore, prepared a provisional scheme, which, in order to test, he gave to students to work with. The result of this scheme convinced him that it was possible so to arrange one as to make it applicable to almost any compound, either natural or artificial, which could be met with in ordinary working. He therefore drew up a carefully prepared scheme, which he modified from time to time, as circumstances were suggested by its use in the Blowpipe Laboratory. The result was such that, after a few months' practice, he felt no hesitation in giving to the students at their final examination mixtures containing 21 substances, one of which contained 12 different substances to be determined. This scheme, with some slight modifications, is the one which he is at present using. It has been in constant use for three years, and has effected an entire change in the working of the laboratory, the students finding great pleasure in what was before a subject of constant uncertainty. He has published it in hope that it may help to make the use of the blowpipe in the determination of mixtures less

difficult than it appears to be when it is approached without some such guide. He acknowledges in the preparation of the scheme the valuable suggestions of his two assistants, Mr. J. H. Caswell, and H. B. Cornwall, M. E.

The substances may contain—

As. Se Cu Pb Au Cd Br SiO₂
Sb. Fe Co Bi Hg Si I No³
S. Mn Ni Ag Zn Cl Co² Ho, etc.

1. Treat on charcoal in the oxidizing flame to find volatile substances, such as arsenic, antimony, sulphur, selenium, lead, bismuth, silver, zinc, cadmium, etc. (p. 66, et seq.)

a.—If there be volatile substances present, form a coating, and test it with microcosmic salt and tin on charcoal for antimony (p. 99) or to distinguish between lead and bismuth (p. 280).

b.—If there be no volatile substances present, divide a part of the substance into three portions and proceed as in A.

a.—Yellow coat, yielding with microcosmic salt a black bead, disappearing with blue flame, no part of it yielding green Sb. flame, indicates—Pb, and Bi.

b.—Yellow coat, generally with white border, yielding black or grey bead, with microcosmic salt disappearing with blue flame; also the border disappearing with green flame indicates—Fe, and Sb.

c.—Yellow coat, very cellular to b, but yielding no blue flame, indicates—Bi, and Sb.

2.—If ARSENIC, ANTIMONY, SULPHUR, or SELENIUM be present, roast a large quantity thoroughly on charcoal (p. 77). Divide the substance into three portions and proceed as in A.

A.—TREATMENT OF THE FIRST PORTION.

Dissolve a very small quantity in borax on platinum wire in the ordinary flame and observe the color produced. Various colors will be formed by the combination of the oxides. Saturate the bead and shake it off into this porcelain dish; repeat this once or twice (p. 79).

a.—Treat these beads on charcoal with a small piece of lead, silver or gold, in a strong reducing flame (p. 113).

b.—IRON, MANGANESE, COBALT, etc., remain in the bead (p. 115).

If the bead spread out on charcoal, it must be collected to a globe by continued blowing.

Make a borax bead on platinum wire, and dissolve in it some of the fragments of the bead, reversing the rest for acids.

c.—NICKEL, COPPER, SILVER, GOLD, TIN, LEAD, and BISMUTH are reduced and collected by the lead-button (p. 115).

Remove the lead button from the bead while hot, or by breaking the latter, when cold, on the anvil, between paper, carefully preserving all the fragments.

d.—If COBALT be present, the bead will be blue.

If a large amount of IRON be present, add a little borax to prove the presence or absence of COBALT (p. 229).

If MANGANESE be present, the bead when treated on platinum wire in the oxidizing flame will become dark violet or black.

e.—If NO COBALT be present, the bead will be almost colorless.

Look here for Cr, Ti, Mo, U, W, V and Ta.

f.—Treat the button c on charcoal in the oxidizing flame until all the lead, etc., is driven off; NICKEL, COPPER, SILVER, GOLD remaining behind, or separate the lead with boracic acid (p. 442).

g.—Treat the residue g on charcoal in oxidizing flame with microcosmic salt bead, removing the button while the bead is hot.

h.—If NICKEL and COPPER be present, the bead will be green when cold (p. 292). If NICKEL only—yellow. If COPPER only—blue. Prove COPPER by treating with tin on charcoal in the reducing flame (p. 293).

i.—For SILVER and gold, make the special test No. 8.

B.—TREATMENT OF THE SECOND PORTION.

Drive off the volatile substances in the oxidizing flame on charcoal. Treat with the reducing flame, or mix with soda, and then treat with the reducing flame for ZINC, CADMIUM and TIN. If a white coating be formed, test with cobalt solution (pp. 251, 256, 276).

C.—TREATMENT OF THE THIRD PORTION.

Dissolve some of the substance in microcosmic salt on platinum wire in the oxidizing flame, observing whether Si O² be present or not, and test for MANGANESE with nitrate of potassa (p. 210).

3.—Test for ARSENIC with soda on charcoal in the reducing flame, or with dry soda in a closed tube (p. 345, et seq.). 4.—Dissolve in microcosmic salt on platinum wire in the oxidizing flame (if the substance be hot and do not contain any sulphur) and test for ANTIMONY on charcoal, with tin in the reducing flame (p. 99).

5.—Test for SELENIUM on charcoal (p. 368).

6.—In absence of selenium fuse with soda in the reducing flame, and test for SULPHUR on silver-foil (p. 365). In presence of selenium test for SULPHUR in open tube (p. 366). 7.—Test for MERCURY with dry soda in a closed tube (p. 304).

8.—Mix some of the substance with assay lead and borax glass and fuse on charcoal in the reducing flame (p. 401). Capel the lead button for SILVER (p. 407). Test with nitric acid for GOLD (p. 320).

9.—Test for CHLORINE, BROMINE and IODINE, with a bead of microcosmic salt saturated with oxide of copper. 10.—Test for Cl or Br with bisulphate of potassa (p. 374).

11.—Test for HO in a closed tube (p. 353).—Test on platinum wire or in platinum pointed forceps for coloration of the flame (p. 72, et seq.).

12.—Test for CO² with hydrochloric acid (p. 360).

13.—Test for NO³ with bisulphate of potassa (p. 354). 14.—Test for TELLURIUM in an open tube (p. 351).

The numbers refer in all cases to Professor Cornwall's translation of the last German edition of Plattner's work. In the above the metals to be sought for are printed in SMALL CAPITALS, the heavier and dotted letters being inconvenient for use in newspapers.

USEFUL INFORMATION.

Washing Wagons.

Washing wagons is too often looked upon as an operation solely for the purpose of removing a coat of mud; this is one of the objects, and an important one, but the wagon should be washed even when there is no mud on it. During the summer the varnish loses its lustre and assumes a dull, dirty appearance unless it is frequently washed. When a wagon is badly covered with dirt it is best to soak the dirt loose by wetting it with a large sponge, but not rubbing it.

In cities, where water can be forced through a pipe, the sponge need not be used until the bulk of the dirt has run off, then use the sponge, commencing at the upper portion of the body, and do not wash over too much surface at a time, as the water should never be allowed to dry on the body; after washing with a sponge, take clean water and a chamois skin, and wash, and dry immediately with the chamois.

After the body is washed, wash the carriage part and then the wheels; in washing the wheels be careful to clean out the dirt from between the spokes and wipe perfectly dry. Immediately after using a carriage in hot weather the leather and trimmings should be dusted off, and the paint well washed and wiped as directed, using soft water if possible, but never using salt water, as has been recommended by some who are afraid that the supply of water will give out in many of our cities if it is used for other than drinking purposes.

Careful washings will tend to harden the varnish, remove the particles of dust that would otherwise bed themselves in the paint, and keep the carriage fresh and clean. The leather top should also be wiped off, and if an oiled cloth be rubbed over immediately after the leather has been dried with the chamois, it will do much towards preserving the lustre of the leather and prevent it getting hard and shrinking. After washing, always rub the plated work with a woolen cloth that has a little rotten-stone on it. Many a dollar in expense and much annoyance from having a soiled carriage may be saved by thus caring for it.—*Carriage Journal*.

PREPARATION OF WAX FOR POLISHING FURNITURE.—Eight parts of white wax; two parts of resin, and one-half part of Venetian turpentine, are melted over a slow fire, and the mass, when quite melted, is poured into a sufficiently large stoneware pot, and while it is still warm, six parts of rectified turpentine are stirred in. After the lapse of 24 hours the mass has assumed the consistency of a soft butter, and is ready for use. The furniture to be polished must be previously carefully washed with soapy water; then, when the surface is quite dry, a small portion of the polish is taken up with a woolen rag and rubbed over the wood, at first gently, then more strongly. When the polish is uniformly laid on, after an interval of a quarter or half an hour, the surface is once more rubbed with a fresh clean rag. In this way the furniture receives a fine gloss, if not quite as brilliant as a shellac polish. The advantage of the polishing wax is the facility of its application, as it may be used without difficulty by any one, and the polish is not wasted by the spread of oil, as so frequently happens with ordinary polish. A further advantage consists in this, that when the furniture is soiled the polish may be cleaned in the simplest way like a coating of lac, and by repeating the above operation, a new polish is obtained each time. For small articles of furniture this polishing wax deserves a wider application than it has hitherto met with.—*Cabinet Maker*.

A SAFE COATING FOR COPPER VESSELS.—Take twelve parts of fluorspar and as much unburnt gypsum, and add one part of powdered borax. Fuse this mixture in a crucible. Pour the fused mass out, and after it is cooled grind it fine with water, so as to form a thin paste, with which the inside of the copper vessels is to be painted. After this they are set away in a warm place till the paint is dry. When it is thoroughly dry, the vessels are baked in an oven till the coating is fused. On cooling, they will be found coated with a smooth, white, opaque enamel, which adheres strongly to the copper and protects it from the action of all the vegetable acids.

TO CASE-HARDEN WROUGHT IRON.—To case-harden wrought iron, take prussiate of potash, finely pulverized, and roll the article to be hardened in it if its shape admits; if not, sprinkle the powder on it freely, while the iron is hot. This is applicable to iron axletrees, by heating the axle red with heat, and rolling it in the powder spread out for that purpose, turning it up quickly and pouring cold water upon it; then dip it in cold water as quickly as possible. The axle can be used for years without showing wear.

NUMBER OF LOCOMOTIVES.—Some of our principal railways have one locomotive for every two miles of the track, others one for every three, four, five, six or seven miles of track; smaller roads vary from one for ten to one for fifteen miles of track. Taking one to five as the average proportion, 10,000 locomotives may be assumed as the number in use in the United States.

A Railway Accident Explained—Stopping Railway Trains.

By a recent accident on the New York and Oswego Midland Railway, a freight train was completely wrecked. The accident took place while the train was running at a speed of from twenty to twenty-five miles an hour on a down grade. The train consisted of the locomotive and tender, two box cars, then two empty platform cars, followed by twelve or fourteen cars loaded with coal and other freight. The brakeman states that according to orders on down grades, he set the brakes on the box cars in front, and had just put his hand on the brake of the first platform car when he saw the second platform car was off the track. In a moment more it was thrown athwart the track, and a general crash ensued.

Among the reasons assigned for the accident was the stereotyped one, "broken rail;" also slipping of a wheel on its axle; also dropping down at a break. But Mr. Alfred Hawley, superintendent of the machine shop, who made a careful examination of the track and remains of the wreck to ascertain the correctness of these alleged reasons, gives a different report. He found the rails and road bed in perfect order, and no indications of a dropped brake or slipped wheel.

What then was the cause of the disaster? What caused the middle portion of a train to leave the track on a straight, level, well lined, well ballasted portion of the road? The accident was caused by an improper application of the brakes to the forward part of the train when running at a high speed. The checking of the front part of the train caused the heavy rear cars to crush against the light platform cars and lift them from the track. It is more than probable that many railroad accidents have been brought about from a similar cause. The breaking of a train should be commenced from the rear, when the work is not done simultaneously throughout all, or at least a large portion of the cars.

Indian Corn for Brewing Purposes.

The use of maize as a substitute for barley in the manufacture of beer, is discussed among brewers in England. Barley is unquestionably thus far the best beer-making grain produced. The principal reason why it has such advantage of other grains, is that its husk prevents the starch, which is converted into sugar in the process of malting, and then into alcohol during fermentation of the wort, from escaping into the steep, while it allows the water to pass to the starch with sufficient facility. With oats, for instance, the husk is thick, and consequently, the germination is slow, and as the end of the kernel is open, so much of the starch escapes into the steep water that the use of this grain is uneconomical as compared with barley.

At the ordinary relation in price between barley and other grains, barley contains, in a form to be readily and economically utilized, more of the sugar-forming material than can be obtained from any other cereal at the same outlay; besides which, it makes, when properly worked, a better quality of beer than other grains. But the high price of this grain has stimulated investigation as to a possible substitute, and an extensive London brewer has introduced to the attention of the trade the subject of the use of maize malt, combined with a certain proportion of sugar, in the manufacture of beer. He recommends its use especially in the manufacture of brown beers. He has been using it for a considerable period and says that it produces a full bodied, soft drinking beer, equalling in his opinion, if not surpassing that brewed from barley malt alone. It is now recommended for the manufacture of pale ales. At present prices in England it is claimed that a saving of about fifteen per cent. may be effected by this use of maize malt and sugar.

PAPER IN THE ARTS.—Inventors have not yet done experimenting with paper; for some time past they have been trying to make it useful for dondows shutters. The preparation used is the ordinary paper pulp, brought by pressure to the utmost compactness and solidity, with the lightest possible sheet-iron or other casing, to insure stability. This preparation has been brought to a high degree of perfection in Japan, where they are much more skillful in the uses of paper than we are, adapting it to all sorts of articles for domestic use, being as it is claimed, water-proof, weather-proof, and fire-proof, not liable to breakage like crockery from careless handling, nor in danger of corrosion, like most of the metals, from exposure. The material has been used to some extent in this country for furniture, clothing, car-wheels, and many other articles out of the ordinary course of things. As the stuff will not burn, the inventors expect to turn it to use as a new safeguard against fire.

A SERIES of experiments have recently been made by an English scientist to determine the degree of corrosion of iron plates in sea water alone and in contact with other metals. For equal services and equal lines he obtained as results the following: Iron alone, 8.63; in contact with brass, 29.64; in contact with tin, 74.71; in contact with gun metal bronze, 65.39; in contact with copper, 42.79; in contact with lead, 47.90.

GOOD HEALTH.

Symptoms of Fish Poisoning, and Treatment.

It is known to most persons that even fish reckoned wholesome as food, now-and-then when eaten, produce the effects of virulent poison. It is probable that most unpleasant consequences are sometimes experienced when the cause is never suspected. The most common symptoms of fish poisoning are dizziness, dimness of sight, giddiness, palpitation of the heart, and a feeling of weight and heat in the stomach and abdomen. Obligated to assume the recumbent position, the patient notices an itching of the skin; the face, and other parts, presenting red or white blotches, surrounded by a crimson ring. In the palms of the hands and soles of the feet the itching amounts to a burning sensation, and if these parts be immersed in water there is a feeling of tingling, which is regarded as characteristic of the disease. Pains in the limbs and at the joints are also commonly present.

In cases likely to prove fatal there are intense abdominal pains, dysenteric symptoms, and often convulsions. When convalescence begins, the ear skin peels off as after scarlatina, and the hair, and sometimes even the nails drop off. The effects are often felt for years, and disappear only by degrees, and after removal to a cold climate.

A word or two regarding treatment. We must, in the first place, attempt to get rid of the poisonous matter by clearing out the stomach with an emetic, of a scruple of sulphate of zinc, or of a large teaspoonful of powdered mustard in a tumbler of tepid water. Dilute drinks, such as barley water, or toast and water, should then be freely given, after which, if the patient be not too prostrated, a dose of castor oil will serve to expel any noxious matter that may have got beyond the reach of the emetic. The poison having thus, as far as possible, been evacuated, its effects must be combated with stimulants, such as coffee, wine, and alcoholic liquors. If the vomiting and intestinal pains do not yield to this treatment, opium, especially in the form of Dover's powder, in doses of five grains or more, three or four times a day, should be given.—*Druggist's Circular*.

Taking our Food.

An intelligent sea-captain hailing out of New Bedford says: "I have made several voyages to St. Petersburg, in Russia. The people of Russia generally subsist, for the most part, on coarse black rye bread and garlics. The bread is exceedingly coarse, sometimes containing almost whole grains, and it is very hard and dry. I have often hired men to labor for me in Russia, which they could do from sixteen to eighteen hours, and find themselves, for eight cents a day, the sun shining there sometimes twenty hours a day. They would come on board in the morning with a piece of their black bread, weighing about a pound, and a bunch of garlic as big as one's fist. This was all their nourishment for the day of sixteen or eighteen hours' labor. They were astonishingly powerful and active, and endured severe and protracted labor far beyond any of my men. Some of these men were eighty and ninety years old, and yet these old men would do more work than any of the middle-aged men belonging to my ship. In handling and stowing away iron, and in stowing away hemp with the jack-screw, they exhibited most astonishing power. They were full of agility, vivacity and even hilarity, singing as they labored with all the buoyancy and blitheness of youth.

Dr. Dio Lewis in referring to the above says: We Americans eat too much animal food. In consequence, many of us are feverish and prematurely old. During the cold season hard workers need meat, but only once a day. Beef and mutton are best. We think a majority will do well to take this meat for breakfast.

We have now for a few months been living in the following way, with great satisfaction: We breakfast at seven o'clock, and fill our stomach with solid beef and bread. At one o'clock we take a dish of oatmeal or an oyster stew, without milk or butter. Nothing more till next morning. By this plan we can continue our mental labor during the afternoon with no more inconvenience than in the morning. With the accumulated vigor of the night's rest and sleep, we can digest the hearty breakfast without heaviness, even while we are using muscle and brain. We have recommended this plan of living to several editors and other literary friends, and most of them have reported to us perfect satisfaction. One gentleman says, with enthusiasm, that he finds in it a gain in flesh and complete relief from the headache, heaviness and other discomforts which had grown to considerable proportions. This all means that, with the large vital force of the morning hours, we can digest a strong breakfast and at the same time carry on intellectual and physical exertion, but that when the vigor from the night's sleep has been partly expended and we come to the dinner, a hearty meal takes so much from the brain that dullness is inevitable.

To Mothers.

In the management of your little ones, nobody doubts your readiness to sacrifice yourselves for them; but your methods, the wisdom of your service, may often justly be questioned.

At this time we ask your attention to a suggestion or two in regard to your methods of feeding your babies. You know how vital regularity is with us grown people. We may take the plainest food, and in moderate quantity; if no attention be paid to times and seasons, our digestion will soon be deranged. A man may eat nothing but beef and stale bread, the two best articles of food with which we are acquainted, and he may take them in proper quantities; in a month he will have dyspepsia if he constantly changes the hours of his meals. It is not the kind of food we eat at railroad stations, but the irregularity of the hours of eating, which so deranges our stomachs. Now we all know this to be true of ourselves—grown-up, matured, tough people; we believe it to rest upon a physical law. And, in view of this law, let us consider how you feed your baby. You put it to your breast whenever it is uneasy. No matter what makes it cry; if it is hungry, or cold, or has a pin stuck in its back, or is surfeited and has the colic—no matter what may be the cause of its crying or worrying—you treat it with the same remedy—a dose of milk. The little thing does not know that milk is bad for it, and so it goes on sucking. It has learned to do but one thing—to suck; and in its eagerness to get relief it will do that thing fifty times a day. In this way it is made feverish and thirsty. Its little pulse will run up to a very high rate. It is suffering with thirst. Like all creatures with thirst, it needs water. Nothing could be worse than milk. It is poison even to a strong man with a fever. What do you give your baby with a fever? One thing, and one only, and that is milk. Milk, milk, is the food and drink of every baby, given to it five, ten, twenty or fifty times a day, just as it happens. At night it is coaxed to dine every time it wakes up.

A baby six to twelve months old should be nursed about eight o'clock in the morning, and it should have time to get all it wants. Every three hours, till bedtime or nine o'clock at night, it should have a good meal, which should be given with perfect regularity. During the night, nothing whatever. In a month the baby will not only become accustomed to this, but upon this system the little chap will flourish as he never did before. More than half of the stomach and bowel diseases, fevers and fits, from which babies suffer and die, come from irregularity and excess in feeding them.—*Dio Lewis*.

Stomach and Brain.

If it be true—and we suppose it is—that the stomach and the brain are so interrelated that the condition of one organ defines the state of the other, then the man who teaches us the proper laws of cookery must be regarded as a benefactor of his species. One of our leading literary journals recently declared that more good food is worse wasted in this country than anywhere else on earth, and the fact is admitted by all who have had the opportunity to break bread at European tables. It is a proverbial saying that a Frenchman will get three courses out of a bone, and the economies of the German are almost equally famous. The dense populations, the low wage and the distinctions of classes in Europe compel the people to make the most of what they possess. There is very little waste, and hardly any trace of the tendency to dyspepsia which is so peculiar to Americans; and human life is longer and happier in consequence. Our people, bent upon getting through the world in a hurry and generally careless of their diet, might learn something from the Englishman, the Frenchman and the German, and even from the stolid Indian of the far West. Better methods of cooking, less haste in eating, and smaller consumption of unwholesome articles of food, would not only lengthen the average term of life in this country, but also by giving the American stomach better treatment than it now receives, and improve the quality of the American brain.

TAKE CARE OF YOUR HEALTH.—Girls, take care of your health—it is your capital in life. With it you can do great and noble things; without it, the little duties of life become a burden, and your time, which should be spent in good works, must be given to your own personal wants. Do not think that exposure will not injure you because you do not suffer at the time. Do not go, with only a thin gauze covering over your shoulders, in the night-air. Do not change heavy shoes for thin ones, to go riding. Follow no fashion that injures the health. If you want to be old and broken-down at thirty, pay more attention to what some unscrupulous leader of fashion says than to Nature's laws. Loosen your clothing about your waist. Draw in a long breath, and if your clothes press against you, you may know they are worn too tight. They can be worn sufficiently loose only by letting the weight come upon the shoulders. If you would have a clear, fresh complexion, free from eruptions, give your blood a chance to circulate and purify itself.—*Ex*.

MINING & SCIENTIFIC PRESS.

Home Industries—Manufacture of Sub-Marine Telegraph Cable; The Movement of the Stars, 57. **ILLUSTRATIONS.**—Surface-Ground Plan of Belmont Mines, 49. The Archer, 54. The Enterprise Planing Mill; Improved Safety Belows, 57. **CORRESPONDENCE.**—Placer County Mines, 50.

MINING SUMMARY from various counties in California, Nevada and Utah, 53. Market Report, 60.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Price for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the week, 52.

MECHANICAL PROGRESS.—The Limit of Cylinder Pressure; Horseshoe; Soldering Iron and Steel; Lubrication Without Fatty Matter; Tinning by Electricity, 51.

SCIENTIFIC PROGRESS.—Ozone and its Preparations; New Theory of the Aurora Borealis; A New Idea in Wine Manufacture; Determination of Sex; Formation of Clouds; An Accurate Estimate, 51.

USEFUL INFORMATION.—Washing Wagons; Preparation of Wax for Polishing Furniture; A Railway Accident Explained—Stopping Railway Trains; Indian Corn for Breeding Purposes; Paper in the Arts, 55.

GOOD HEALTH.—Symptoms of Fish Poisoning and Treatment; Taking Our Food; To Mothers; Stomach and Brain; Take Care of Your Health, 55.

MISCELLANEOUS.—Gravel Mining in Shasta County; Silver Bullion and Coin, 50. Mineral Land Decision; Singular Stone; Blowpipe Analysis for Practical Men, 54. The Mines of the Ruby Consolidated; (Limited); Pierre Blot on Gravel; Graham Rolfe; Laws Under the New Code, 58.

REBUILT.—The wagon-works of J. W. Farron, No. 121 Beale street, which were totally destroyed by fire in November last, are now entirely rebuilt, and the business of this large establishment is once more in full blast. Mr. Farron has shown considerable pluck and perseverance in re-building his premises and recommencing business in so short a time. The fire was a most disastrous one, sufficient, in fact, to discourage any one of a less sanguine temperament than Mr. F. He informs us that he has more orders on hand than can be completed this month, and, from the appearance of his factory, we should say that this statement is correct.

VIENNA EXPOSITION.—The appropriation by the United States Senate for defraying the expenses of exhibiting American productions at the approaching Vienna Exposition, has been increased to \$300,000. We have frequently alluded to the importance of this Exhibition to the people of the United States, and are glad to see that active measures are being taken, which will result in an appropriate American display.

THE POLYTECHNIC LECTURES.—Mr. Amos Bowman will form a class on special and mining geology on Tuesday evening next at the Mechanics' Institute. Mr. Hanks is organizing a similar class in practical mineralogy at the same place.

S. F. TRADE GUIDE.—Messrs. Bishop & Co. have just issued the January number of their Semi-annual Business Directory of San Francisco. Among other features we notice they have inserted a directory of the streets.

THE FIRST QUARTZ MILL IN CALIFORNIA.—The *Mariposa Gazette* of this week answers our queries in relation to the location of the first quartz mill built in California, but we are unable to give the article until next issue for want of space.

The new shaft for the steamer Arizona, from the Risdon Iron Works, has been placed in position.

The "Ancient" Pliocene Rivers of California.

Origin of the Auriferous Gravel Deposits.

The lecture by Amos Bowman, of the Geological Survey, on Thursday evening of last week, was one of much interest to all who desire to become acquainted with the wonderful geological events which preceded and led immediately to the present configuration of the country now embraced within our Pacific States and Territories, and during which the immense deposits of auriferous gravel were formed, which are affording such golden harvests to the miners of California. The lecture took a wide range, and embraced much to which we cannot now refer; but to which we may again return in a future issue. We propose now to simply confine our report to a few notes on the early physical condition of this Coast, the Pliocene rivers of California, and the origin of the auriferous gravel deposits; and in doing so, we shall not attempt to give the remarks of the lecturer in full, or to follow his words in what we do give.

The Ancient Sea of the Sacramento Valley.

After a brief introduction, including the explanation that the Pliocene Period was the concluding epoch of the last great geological subdivision of time, at the conclusion of which the upright, mammalian, walking and articulating man, made his appearance on the earth, the speaker pictured to his audience the Pliocene Sea, which once occupied the region now known as the Sacramento Valley, and extending from near Shasta on the north to the extreme southern limit of the Tulare Valley on the south.

Standing upon the top of some jutting rock, about midway up the Slope of the Sierra Nevada, and looking westward, before you lies this vast departed sea of the period of the ancient rivers, embraced in one grand sweep of vision, extending some three hundred miles in length, and covering about 30,000 miles of area, with a depth of over a thousand feet below the present bed of the Sacramento river, as is shown by the Stockton artesian well, which yielded golden sands to near its bottom. The Marysville Buttes were then a fiery island, like Stromboli, of the Mediterranean. Farther to the north was Mount Shasta, built up to a height of 14,000 feet by its erupting lavas. Still further north, Mounts Hood and Baker—twin brothers of Shasta—presented their lofty summits, helching forth fire and smoke. Directly in front of the observer were Mounts Disblo and Tamalpais, between which were the straits, which connected this sea or gulf with the ocean. In the rear, and not far distant, might have been seen a long line of volcanoes flaming up from far into Oregon, and following the present summit of the Sierras, as far south as Silver Mountain, Mono, and beyond.

This ancient sea was separated from the ocean by a range of low hills or islands, along what is now known as the Coast Range. The waters stood on the flanks of the Sierra Nevada at an altitude of about 600 feet, above the present base of the foot-hills—near the level of where is now Shasta City; above Horse Town; not far from Oroville and Timbuctoo; somewhere between Pino and Auburn; above Knight's Ferry, and not far below the base of the Tuolumne and Calaveras Table Mountain. The shores of this ancient pliocene sea, the adjacent islands, and the gentle slopes of the Sierras (not then as high as now) were clothed with forests, differing materially from those now existing in that locality, and embracing countless numbers of palms. Huge turtles wallowed in the shallow bays, and strange ante-diluvian animals,—huge elephants, twice as large as any now in existence; oxen of proportionate size, and mastodons, tapirs and camels roamed through the forests. Horses were then natives of this continent, and primeval man, differing materially from any present races, was then existing, and with the animals joint possessors of the soil, and a witness of the grand physical phenomena to be described. He alone, however, of the animals named, was enabled to survive the convulsions of nature and changes of climate; and this he did by his well-known independence of geographical range and conditions, and his superior capacity for guarding against the vicissitudes of time and change.

At this time those famous rivers, the gravel-filled beds of which are now affording such abundant harvests of gold mines, were pouring their waters into the pliocene sea. Such was the physical and topographical condition of things in this portion of the world in the plio-

cene era—a hundred thousand years ago, more or less. But as change is Nature's law, this state of things could not exist forever.

Following those changes as recorded in the Book of Nature—and God tells us no uncertain tale, but always leaves us a sample piece from which we may reason inductively or by analogy—we arrive at

A Series of Great Natural Events,

Corresponding to great periods of time, which were stated by the lecturer substantially as follows:

1st.—The Pliocene or ancient eroding period, during which these deep, "dead" river channels were cut into the "bed-rock."

2d.—These Pliocene channels filling up with gravel—or the choking or damming period.

3d.—The active volcanic period of the Sierra when the gravels were capped with lava and volcanic ashes.

4th.—The cold or glacial period, when the mountain slopes were covered with living, moving glaciers.

5th.—The modern erosive, or recent period, during which the present river channels were formed, crossing the old channels at various angles.

This peculiar action of successive erosions and filling was not due to local causes, as it applies with great uniformity to all the streams alike, throughout four or five degrees of latitude.

We solve the problem of the Pliocene rivers when we ascertain what made the rivers cease cutting, at some period in the Tertiary, and fill up some 1,200 feet with gravel and boulders at the end of the Pliocene—as marked by the volcanic outbursts—to renew the extraordinary erosive action which has resulted in our present world-famous cañons. Only two causes of a general nature, such as the case calls for, can be mentioned:

1st. Changes in the quantity of rain; or, 2d, changes in the grades of the rivers. The same or even a larger quantity of water would have been inadequate to clear the cañons of the loose, red material from the heights where such water was enabled to disengage it, and to bring it as far as to the cañons, where the gravel remains to this day.

A rainless Pliocene period, such as would be implied under the first condition, we know from the rich tropical character of the vegetation found fossil in the gravels, could not have existed. A rainless period would not have produced the washed gravel boulders, loosened and rounded and carried as far as the deep cañons and then dropped. There would not have been power to produce any gravel, to say nothing of transporting it.

The speaker ascribed the filling to a lessening of the grades, perhaps by the force which caused the uplift of the Coast Range. This uplift occurred during the Pliocene period to the extent of at least 800 feet, near Mount Disblo—that being the difference between the height of the Miocene rocks that were uplifted during the Pliocene epoch. Or the subsidence of the coast may have had something to do with it. The general post-pliocene rise of the land, including the crest of the Sierra, furnished the erosive grades for the present cañons.

The Course of the Ancient Rivers

Has been frequently remarked to be "at right angles" to that of the present streams. In any change of bed, such as has been described, there would necessarily be crossing and re-crossings, at right angles and at all other angles, by the displaced waters, thrown from their ancient channels and compelled to seek new courses. No uniformity of crossing or angle, in one direction more than another, has ever been attempted to be shown by actual surveys or measurements. The speaker remarked that after devoting considerable time and labor to collecting facts for the determination of this question, he had arrived at the general conclusion that the "ancient rivers do not appear to have materially varied in their general course from the rivers now existing. If such be not the case, the contrary at least remains to be proven. [The Big Blue Lead is now pronounced a myth, as it is found passing through nearly every claim looted in "deep gravel."] The source from

Whence Came the Auriferous Gravels of California? was pointed out by reference to a diagram, a representation of which was given in our issue of January 14th, under the head of "About California's Gold-Bearing Rocks."

We may readily calculate from the vast quantities of subaqueous detritus in the Sacramento Valley, and that read by the testimony of the ancient rivers and the present river cañons of the Sierras, whence came this immense auriferous deposit. Commencing in the Sacramento Valley we find an immense area of gravel and fine detritus—some 300 miles in extent by 50 wide, and averaging many hundreds of feet in depth, every portion of which is more or less charged with fine gold. As we pass out of the valley into the foothills the gravel becomes coarser and shallower, until, as we ascend, the rocks in places are completely hard, and the gravel is confined mostly to the cañons and valleys of recent denudation. Here and there, however, we meet with larger masses of gravel, as at Smartsville, Pilot Hill, Newcastle and Oroville, which are evidently portions of the ancient river beds, that the more recent erosive action has never disturbed. Here we find, mixed with the gravel small water worn boulders, which increase in average size as we ascend towards the summit of the Sierra. At a certain elevation we find massive boulders—some of them many tons in weight, showing a greater declivity in the river courses, by which it was possible for

such rock masses to be moved by aqueous agency.

In many localities, as in the Calaveras Table Mountain, we find, these accumulated gravel deposits filling the ancient Pliocene river cañons to the brim and sealed up, as it were, by immense overflows of lava and mud and volcanic ashes.

Going back to the time when the Pliocene rivers commenced their flow, rapidly at first in the higher portions of the Sierras, and gradually lessening the force of their currents as their waters reached the more level land near their mouths, at the shores of the ancient sea, we see the commencement of the erosive action by which the earliest of the auriferous gravel was produced: Following down the long geological period to the time when the damming up of those rivers first commenced, and the outflow of gravel to the Sacramento Valley was checked, by which the ancient channels were filled; and passing from thence to the period when those rivers were forced out of their channels, and compelled to form new beds with consequent increased erosive action, the breaking down of quartz veins and partial disturbance of the pliocene gravel beds; occurrences which must have occupied many hundreds of thousands of years, we find abundant evidence of the origin of the auriferous gravel, which is now found so universally spread over the western flank of the Sierra Nevada. The great sluices of Nature and the powerfully erosive action of glaciers and alternating frosts in the higher altitudes, operating for immense geological periods of time, have been washing and wearing away the mountain side until it has been cut down though its whole extent at least an average of 1,000 feet, thus liberating the gold from its ledges of quartz, freeing it of its vast mass of earth, which has filled up the entire Sacramento Valley, and leaving for man only the work of "cleaning up."

Academy of Sciences.

The regular semi-monthly meeting of the Academy was held on the 20th inst., Professor Davidson in the chair. The following named gentlemen were elected members of the Academy: Hon. J. P. Jones (life member), A. A. Gansl (life member), T. Parrott, (life member), Ossper Schenck, George T. Merye, Jr., (life member), E. L. Beard, Montgomery Fletcher, Samuel P. Middleton. A number of propositions for membership were received and laid over to the next meeting. R. E. C. Stearns, one of the oldest members of the Academy, on recommendation of the Trustees, was elected to life membership without fee, in recognition of distinguished services.

Donations to Cabinet and Library.

H. G. Hanks presented specimens of a new mineral designated as Durangite, having the form of small granules of a dull red color. The specimens were received from Durango, Mexico, in which vicinity the substance exists in considerable quantities, but previously only a few specimens were known to the scientific world. This mineral has no special value, and the specimens were only prized as curious formations.

The Secretary announced the receipt of a list of about 150 works, in different languages, from the Smithsonian Institute, Washington, comprising publications of value from the scientific societies of Europe.

Dr. Kellogg announced that at the next meeting of the Academy he should present a number of specimens of rare plants of this Coast, not heretofore commonly known to the members.

Miscellaneous.

Professor Davidson worked out on the black board four new propositions in mensuration, having a practical value in mechanical and engineering operations.

Dr. Gibbons exhibited specimens of a tape worm engendered in the human system from eating rare beef which contained the germs. In the course of his remarks he stated that a few months ago, a little child was affected with tape-worm. In due course of time all traces of the tape was eradicated from her system, when shortly afterward a new species of worm made its appearance, which he denominated as being the beef tape-worm. The child had been fed for a while on pieces of raw beef, and to this he attributed the appearance of the worm.

Iron Sands Again.

It will be remembered that not long since Dr. Stout called the attention of the Academy to the fact of the existence on this Coast of extensive deposits of iron sands. A quantity of black sand of the magnetic oxide of iron had been presented in proof of the statement, but had been rejected by most of the members. Some, the speaker said, entertain the view that this sand was originally caused by volcanic action; others contend that through atmospheric changes large masses of iron disintegrated itself, and forming itself into particles became united with the white sand. He had brought specimens of the sand with him, one of which was the magnetic oxide of iron, while the other was non-magnetic. Some little discussion ensued on the subject which will probably be continued more at length at a future meeting.

Professor Davidson stated that steps were being taken by the Trustees to obtain more suitable rooms for the Academy. The meeting then adjourned.

Home Industries—Manufacture of Sub-Marine Telegraph Cable.

The manufacture of wire rope has been carried on for some time in this city, but until recently no attempts have been made to manufacture sub-marine telegraph cables, and in fact there has been little need for it here until the past few years. We paid a visit this week to Hallidie's Wire Rope and Sub-Marine Telegraph Cable Works on the corner of Vallejo and Sansome streets, to see a cable that was being made for the Electrical Construction and Maintenance Company. The premises occupy a fifty-acre lot near the water, and in a convenient place for shipping. The main building is two stories in height, the lower story of which is used for the machinery and the upper for a loft or place for fitting ropes, etc. There are three wire rope making machines of different sizes in the building, besides the one used for making this cable. While there we saw a three-inch wire-rope 300 feet long made in nine minutes. Of course the bobbins, etc., were previously prepared.

The cable is made on one of Bowden Bros' horizontal cable machines of twelve spindles, constructed at Newcastle-on-Tyne, England. A piece of cable two miles long has just been shipped, and the piece being made will, when finished, be 13,200 feet, or about two and a half miles in length. The core consists of seven number 22 copper wires thoroughly insulated up to 5-16 of an inch in diameter, covered with gutta percha and Chatterton's compound; over this is a layer of canvass and rope yarn, measuring in all 9-16 of an inch. Outside of this core are twelve No. 9 galvanized iron wires, each of which has a tensile strength of 1,500 pounds. When finished the cable is about one inch in diameter, and weighs in round numbers, four-fifths of a pound to the foot. The gross weight of the cable and reel upon which it is wound, for the one length of two and a half miles, will be 13,000 pounds. The factory with its present machinery can turn out a mile of cable in a day of ten hours. They made 12,000 fathoms on last Saturday night; still another piece is to be made.

In making the cable, the core passes through the hollow shaft of the machine and meeting the wires at a central point is covered by them. The twelve bobbins revolve around a common center and the rope is drawn on to the reel by gearing attached to the reel. Considerable care is required to keep an exact strain on all the bobbins, for if one wire breaks the machine has to be stopped in order to join the ends.

This enterprise is of course as yet only in its infancy, but the proprietor hopes to extend his business ultimately to greater proportions. In fact, the main cause of its foundation is that they are in hope of being able to make the China and other cables for the Pacific. The great danger to be apprehended in the transportation of submarine cable is from the change of temperature in crossing the tropics, as shown by the experience of the Red Sea and Panama cables. The only safe way is to lay it in large tanks filled with water; the reason why the Atlantic cable was so successful was that it was put down in a favorable season with no extreme heat, and is, moreover, in a northern latitude. If a cable to run to China were built in the Eastern States and shipped here it would have to be carried across the tropics twice, and it would be impracticable to put large lengths on cars and then re-ship it into vessels. Therefore it will be much more economical, and at the same time more convenient to have these cables made here, and this factory will be able to make them. In such a case of course appropriate machinery will be supplied for turning out large pieces.

The factory employs at present 14 men. The engine and boiler are in a shed adjoining the main building. Large scales are placed in a convenient position for weighing the wire, etc., and there is a commodious yard with store-houses for surplus stock, etc. The wire ropes for mining purposes, etc., are not generally made of galvanized wire but of common wire which receives a coating of Stockholm tar. The tar in the tanks is heated by steam, to avoid the use of fire on the premises as much as possible. We saw at the factory the old hoisting rope of the Amador mine, which has been lying since the fire at the bottom of the shaft. It is now being repaired and straightened, a thing which seemed almost impossible as it was twisted and unwound in every direction, and was covered with rust. They have made at this factory wire ropes 4,000 feet long. The establishment is very complete, and may be ranked as one of the rising industries of the State.

CALIFORNIA MINING MACHINERY FOR COLORADO.—We have been shown a letter from a mining superintendent in Colorado, ordering a number of Hendy's concentrators to be sent to Georgetown, Cal. Two concentrators which were there on trial, have worked in so satisfactory a manner on roasted ore or the tailings as they passed from the settlers that the others were ordered. The Superintendent recommends them as working well.

The Enterprise Sawing and Planing Mill.

The business of finishing lumber in all shapes is quite an extensive one in this city, for from here all the interior towns are supplied with sashes, doors, blinds, mouldings, etc. The extensive lumber region to the north of us finds a ready market in this city and large quantities of rough lumber are made into shape here before being shipped to the country. Among the most prominent and oldest established sawing and planing mills in the city is the Enterprise, owned by D. A. Macdonald & Co., a representation of which is shown on this page. This establishment is now one of the largest and most complete on the Coast, and the machinery is of the latest and most improved pattern, capable of turning out all kinds of mill work to the best advantage. This mill was established in 1854 and was then located on the corner of Market and Beale streets, and known as Chace's Mill. It has been in the present location, 217 and 225 Spear street, for two and a half years. The premises occupy five water lots and run through from Spear to Stuart street.

The 100 horse-power engine which furnishes

power for the machinery, was built at the Risdon Iron Works, and is set on a very solid, well-constructed bed, as it is on made ground. The fly wheel weighs 7,750 pounds, and the main belt is 24 inches wide and 124 feet long. The boiler is in a separate house from the engine and entirely distinct from the mill. The lower story of this edifice contains the boiler, etc., and the upper is utilized as a drying room, having a capacity for holding 20,000 feet of lumber. The house is as fire-proof as it can be

IMPROVED SAFETY BELLOWS.

made, being of brick with iron rafters and roof; above the rafters is a heavy layer of brick and mortar. Water pipes are laid throughout the mill and hose is kept in many different places in readiness in case of fire. The proprietors in their long established business in this city have been peculiarly fortunate in more than one respect, for they have never been burnt out. There are 35 wood-working machines in the mill, so they are able to turn out every class of work. The assortment of mouldings, frames, brackets, etc., is particularly complete. The firm has issued a hand book of mouldings for the benefit of their customers in the interior,

who can send for what they want by ordering according to class and number.

This lower story of the mill is used for heavy work, while the upper, divided off into departments is for different classes of work. A small inclined tramway runs from the rear end of the second story to the ground and a rope and pulley carries the material up and down as desired. The mill covers three water lots and the remainder of the ground is used for storing lumber. This machinery is all very complete and is adapted for all kinds of wood work, planing, sawing and cutting in all departments. About 75 men are now employed, but they expect to have about 200 at work this summer. A large amount of the products of this mill is shipped to Oregon, Washington Territory, Utah and the interior of this State. The furthest point to which they ship is Salt Lake City. This enterprise was started in 1854 by Chace and McDonald, and at that time they began with a little engine and boiler, one circular saw, and a planing machine. They have a good reputation for the work turned out, and for their energy and perseverance. This is a dull season of the year for this trade, but nevertheless, a brisk business is being done.

Non-Explosive Bellows.

The California Bellows Manufacturing Company, of this city, is now making a new style of bellows, which they call the non-explosive,

a cut of which is shown on this page. The principle of construction is the same as in ordinary bellows, with the exception that a peculiar safety-valve, the invention of Joshua Hendy of this city, is used, instead of the common valve for permitting the air to enter. This valve is simply a disk of perforated iron, on the under side of which a circular piece of gutta-percha is secured to its center. The valve is attached to the top board instead of the bottom as usual, and the action of the bellows closes it; when the bellows cease to blow, the valve opens immediately, admitting air into the top chamber, which prevents its filling with gas, thereby preserving the leather from the heat, as well as preventing explosions. The law of the universal diffusion of gases operates to a disadvantage in the case of bellows, and accidents have happened from the bellows being filled with gas, whereby persons have been seriously injured and some killed outright. The manufacturers claim that this simple valve obviates all danger from this cause and at the same time preserves the leather of which the bellows is partially constructed.

THE ASSAYERS OF NEVADA VS. THE CARSON BRANCH MINT.—The managers of the U. S. Branch Mint at Carson City, Nevada, have recently taken upon themselves, as alleged, "without authority of law," to assay ores, bullion, etc., for the public, whereat the outside assayers are indignant, for the reason that it threatens to ruin their business. The assayers, through Conrad Wiegand, Esq., formerly assayer of the mint in this city, have accordingly issued a "protest and petition to Congress" wherein they ask for remedial legislation which will compel the mint to confine itself to its legitimate business. The protest, etc., comprises a well and forcibly written pamphlet of 60 pages, wherein the practice above set forth is declared "a useless, unjustifiable and wanton interference with a legitimate private industry."

COAST SURVEY.—The steamer Hassler has started on her trip for the survey of the Coast between San Diego and Panama. This survey is something which should have been made a long time ago, as the charts, etc., of the lower Coast are very imperfect.

The Movements of the Stars.

The third of the Polytechnic Course of Lectures, by the University Professors, was delivered on Saturday evening last by Professor John Le Conte, at Corinthian Hall, on the "Stars and their Movements." This interest in these lectures is well manifested by the large attendance. We regret that the want of room compels us to confine our notice of this interesting and instructive lecture to a brief synopsis.

Immensity of Space.

Discussing the vast distances of the fixed stars, the lecturer said that beyond the boundaries of our solar system there is a vast and almost illimitable abyss of space—a vast, empty chasm, in which no material body of any considerable magnitude exists. A portion of this space is traversed by comets which have long periods of return. If any large body exists there, though it might not be seen by the eye of man, yet it would make itself known by the disturbing influence of its attraction.

Under the guidance of science, man has also become fully assured that beyond this immense void a stellar universe exists, the nearest members of which are so remote that the mind of man can scarce comprehend the vast distance. Moreover, the many striking indications of the unity of plan which pervades the universe leads us to believe that all the stars which we see in space are centers of other systems, and are also separated from each other by a similarly wide void, which we find around our own solar system.

Distances of the Stars.

The Professor proceeded to explain the difficulty which early astronomers experienced in demonstrating the absolute fact of the wide separation of the fixed stars from our system. The well-known principles of the measurement of distances by geometry and trigonometry were first applied by using the diameter of the earth (eight thousand miles) as a base; but no parallax was observable. The same result was at first obtained when the diameter of the earth's orbit (about 190 millions of miles), was employed as a base. But with the perfection of instruments capable of measuring exceedingly small angular distances, slight variations in the apparent relative position of certain stars have been observed from which it is easy to calculate the approximate distance of such bodies from the observer.

Again, the same instruments and the same modes of measurements when applied to other stars show no change of position, and of course afford no means by which we may calculate their actual distance, although their distance is thereby fixed as beyond a certain limit due to the length of the base line and the power of the instrument for measuring minute angles.

Bradley commenced his observations for determining the parallax of stars about 1725, and discovered aberration and nutation. Galileo subsequently introduced improved methods of observation, and Herschel in 1781 introduced a method still superior; and formed a catalogue of stars best adapted for its application. All the efforts of astronomers, even up to his time, failed to detect any sensible stellar parallax. The labors of Herschel, however, were rewarded by the important discovery of the double stars. The great trouble, all this while was mainly due to the imperfection of instruments. The instruments at first employed would measure an angle of only one minute, which testified to a distance of only 3,438 times the earth's mean distance from the sun (ninety-five millions of miles.) Bradley, who made the first important progressive step in this enquiry, reduced the measurement of the angle to one second, which increased the distance of measurement to 206,265 times 95,000,000 miles, but still failed to detect a parallax—thus being unable to find a star within that distance of the earth.

Since his time the perfection of instruments has been such that a distance can now be measured equal to 2,062,648 times 95,000,000 miles, within which it is proven that many stars are found, and beyond which it is known that an innumerable number exists. The distance of the nearest fixed star expressed in words is—twenty-one and a half millions of millions of miles! When we reflect on stellar distances we are overwhelmed with the immensity of the numbers required for their expression.

Our Sun an Exceedingly Small Star, as Seen from other Systems.

The lecturer said that a globe large enough to fill the entire space enclosed within the earth's orbit, would appear at the distance of the nearest fixed star hardly larger than the third satellite of Jupiter, and of course invisible to the naked eye. [From this comparison we may infer that our sun, immense as it seems to us, when compared with any one of the fixed stars, must bear quite as small a proportion as would a globe of only some 10 miles in diameter to the entire bulk of the earth!]

The problem of the movements of the stars and their distances was not fully solved until 1838, when Bessel announced the results of his observations on 61 Cygni. These observations were further, and more fully verified in 1839-40.

The Mines of the Ruby Consolidated Company, (Limited).

At our solicitation, a friend has furnished us with the following notes of a visit which he made to the mines of the above named company a short time since. From an examination which we ourselves had made of some of these mines, we believe that our friend's observations are exceedingly accurate. The first mine visited was

The Bullwhacker,

Which is one of the leading and most promising of any in the district. This mine is what experts would term a "fissure line deposit lode;" that is to say, the ore bodies are found on either side of the true line. The main shaft has been sunk to a depth of 243 feet, lowest exploration, disclosing ore bodies of high grade galena by a drift of 185 feet. Eighty feet from the surface, in the main shaft, a drift has been run along the line or wall southwest a distance of 190 feet, commencing with what is known as the south shaft. In this drift, ore is to be seen in good quantities almost the entire distance; also in the different stopes making upward from the drift. The mine at present is producing twenty tons of ore per day, and, if necessary, could double the amount for many days to come.

The Dunderberg

Was found, rather unexpectedly too, what may be called a true fissure vein. The main shaft has been sunk by incline 150 feet deep, the vein being traceable from the surface to the bottom, varying in width from 7 feet to 10 inches. In the lowest working, the vein varies from 10 to 28 inches in width. A noticeable feature in this mine is the true clay selvage at the upper wall, varying in thickness from 1 to 6 feet. The mine is at present producing daily an average of 14 tons of ore, and, from its appearance, should give good returns. Work on both the Bullwhacker and Dunderberg is being vigorously prosecuted by double shifts of men, and with much good judgment. Next, further on and up the mountain, our informant examined the two series of mines, closely situated, known as the

Lord Byron and Valentine.

The descent into the Lord Byron was anything but pleasant, from the fact of being obliged to continue downward until the bottom was reached, 220 feet from the surface. On close examination in the bottom working of the shaft, the ore body was found to be about 5 feet in width of what appeared as high-grade carbonates, intermixed with galena. In ascending, more attention was given to the ore along the line or sides of the shaft, almost continuous to the surface, with, of course, the usual characteristic called pinching here and there; but to the credit of the mine, the shaft promises very well indeed. In the Valentine shaft, at a distance of 128 feet, 60 feet of which has been sunk in the usual way, the bottom of the shaft opened into a natural cave, measuring 125 feet, at an angle of 45 degrees. Splendid ore bodies of high grade carbonates have been disclosed throughout the cave, and give good promise of a fine mine. There are several other shafts on the Valentine series, varying in depth from 60 to 120 feet, all of which show more or less good ore.

The El Dorado

Series was the next in order; but when shown the locality and observing the time the visitor's courage failed. The El Dorado, however, as is well known, is still producing, without doubt, the highest grade of ore in silver and gold of any mine in the district.

The Reduction Works

Of the company are by far the most suitably located of any in the district, and to some one belongs the credit of the good judgment with which the site was selected, as also, the efficient arrangement for the expeditious and convenient handling of ores, slag, etc. It was the intention of the company to have erected at least two first-class furnaces; but the winter months had approached so closely before the completion of the present one, that it was deemed advisable, on its completion, to commence the production of bullion as soon as possible. This was done; and, everything being in readiness on the 15th day of November last, Superintendent L. N. Dougherty gave the signal to "let her go." She did go, and nicely too; and is still going, if one can judge from outside appearances. She will probably run the old year out, and continue through the month of January, 1873. The furnace turned out, for the week ending December 23, fifty-one and nine-tenths tons of bullion, or an average per day of seven tons and over. On the 24th of December, of the same week, the furnace produced 19,829 pounds of bullion, or nine tons and 1,829 pounds. In fact, it is thought that there has not been a single instance in our district, where a furnace has been started and handled more successfully; especially, if we consider the fact the machinery and everything in connection with the works was new and untried. Our informant thinks that some one should at least be credited with good judgment, for the production of these evident results.—*Eureka Sentinel.*

More than £550,000,000 are invested in railways in Great Britain and Ireland.

Pierre Blot on Gravies.

Among the very important articles which the cook prepares, there are none more important than the gravies which aid to render the meats palatable when placed upon the table. Most of our cooks have an idea that a little melted fat and some burned or raw flour stirred in, makes a wonderful gravy. But they don't. They never did. A gravy should add to the flavor of the meat, and should heighten it, and render the meat more savory; common gravies generally do the contrary. Listen to the Professor:

A cook is not more immaculate than any one else, and has the most difficult task in any, no matter what profession or trade. A chemist may begin and finish his work at any time; it is the same with the carpenter. A metal-worker must strike when his metal is hot and ready to work, but he does it—that is, heats it—at any time he chooses. A cook cannot select his or her time to work; the work has to be done at a precise time, and must be finished in spite of any mishap, at a precise time. If the work is accelerated, it may take away part of the flavor of the dish prepared. The same result will follow if the work happens to be done too slowly. Many excellent dishes are spoiled by not being served at the proper time. Everybody knows the difference between a steak served directly from the gridiron and one that has been kept in oven for a short time.

As a gravy is indispensable to roast meat, we will tell our readers how to make it. The best meat is generally fat, especially a joint, a turkey or a chicken, etc.; therefore, when the meat is roasted, there is scarcely any liquid but fat left in the pan. As fat must not be served, the joint or bird is dished and put in the oven, the door of which is left open; all the fat is turned off the pan, broth is put in it instead, and the pan is placed over the fire. Take a wooden spoon, stir gently all over the bottom of the pan, give one hoil, turn the contents over the joint through a strainer, and serve. You then have a gravy that deserves that name, and not a greasy, muddly substance, as uninviting to the eye as it is to the palate.

On meeting Dr. Dixon, one day, he accosted me smilingly, saying, "Blot, my wife engaged a new cook yesterday, a very queer cook; she took me for a chicken, and put flour in my gravy." The digestive apparatus of man was not made to digest raw flour. When flour is used in the composition of a sauce, it must first be properly cooked.

Broth is easily and cheaply made. A careful cook will get almost enough to make as rich broth as is necessary for the soup, sauces and gravies, in the trimmings of hasting pieces, the bones of roasted joints of beef and veal that are generally left on the dish, and the bones of turkeys and chickens. When there is not enough of the above, a pound or two of beef, according to the size of the family, may be bought to make the broth. The pieces for soup are either from the shin, leg or chuck piece, and must be fresh. The broth-kettle, or digester, is placed on the fire with the water and meat in it, and the scum skimmed off carefully as soon as it collects on the surface. After being skimmed, the vegetables are put in, and then it is simmered (not boiled) for five or six hours. Every green-grocer knows the vegetables necessary to season broth. When done, it is strained, the fat that floats on the top is removed by means of a ladle or large spoon, and it is ready for use. In England they call broth, stock. In the kitchens of English lords and other rich families, there is a large pot or kettle on the corner of the fire, in which the broth is made; it is there all the time, from morning till evening, and used for all cooking purposes. Hence the word stock given to it.—*Harper's Bazar.*

GRAHAM ROLLS.—Take cold Graham pudding, mix in either Graham or white flour until you have a stiff dough; when thoroughly mixed, cut in pieces of an equal size, take one piece at a time, sprinkle well with fine flour, roll in the hands patting the ends to keep them even until you have a roll three or four inches long and 1½ thick, lay them on a platter or moulding board, have the oven the right heat, not quite as hot as for water gems—but about right for milk gems—wing off the grate, lay them about one inch apart. If baked right they will be a light brown, and light enough to crack open. Corn meal pudding can be used in the same way by working Graham, white or rye flour. This is very convenient for those who have not the cast-iron bread pans.

SAUSAGE MEAT.—If you want it extra nice, take two nice fresh hams and one shoulder; take off the skin and have it chopped nicely, season it with salt, pepper, sage, and a little sugar. If you like spiced meats, use with that a few cloves, some mace and nutmeg. Keep it in a dry, cool place, and fry it in balls, or stuff the skins when you first make it for dried sausages.

A GOOD AND SIMPLE CURRY POWDER.—One of our Boston druggists sends us the following recipe for curry powder, which is not only much simpler than the ones usually given, but has been endorsed as excellent by persons who have been familiar with the condiment as prepared in the East Indies: "Mix one ounce of Cayenne pepper, four ounces anise, and two pounds tumeric."

Laws Under New California Code—Taking Effect Jan. 1, 1873.

Formation of Corporations.

[Corporation Defined.]

233. A corporation is a creature of the law, having certain powers and duties of a natural person. Being created by the law, it may continue for any length of time which the law prescribes.

[What are public and private corporations.]

234. Corporations are either public or private. Public corporations are formed or organized for the government of a portion of the State; private corporations are formed for the purposes of religion, benevolence, education, art, literature, or profit.

[Corporations, how formed.]

235. Private corporations may be formed by the voluntary association of any five or more persons, for this purpose and in the manner prescribed in this Article. A majority of such persons shall be citizens of this state. Married women may become corporators, officers and members of religious, benevolent, art, literary, or educational corporations.

[For what purpose private corporations are formed.]

236. The purposes for which private corporations may be formed are the following, and none other:

1. Fire, marine, life, health, accident insurance;
2. The insurances of the lives of domestic animals;
3. Construction, conduct, and maintenance of railroads and telegraph lines in connection therewith;
4. Construction, conduct, and maintenance of street railroads, plank roads, turnpikes, common wagon roads;
5. Construction, conduct, and maintenance of bridges, ferries, wharves, chutes, piers;
6. The establishment, conduct and maintenance of express or stage lines.
7. Constructing, conducting, and maintaining telegraph lines;
8. Constructing and maintaining canals for navigation, and canals and ditches for drainage, agricultural, or mining purposes;
9. For navigating the ocean, or any of the waters of this State, with vessels propelled by sails, or in whole or in part by steam;
10. The purchase of lands for, and the distribution of homesteads;
11. The accumulation of funds for the purchase of real property, and for the erection of buildings and improvements thereon, for the benefit of the members thereof.
12. Accumulating savings and loaning the funds of the members thereof;
13. Manufacturing, mining, mercantile, mechanical, wharfing, docking, or other purposes, or for engaging in any other species of trade, business or commerce;
14. The transacting of a printing and publishing business;
15. To supply water to the public;
16. The manufacture and supply of gas, or the supply of light or heat to the public by any other means;
17. The establishment, conduct, and maintenance of hotels, laundries or theaters;
18. For the formation, conduct, and maintenance of District and County Agricultural Fairs;
19. The encouragement of, or business of, agriculture, horticulture, or stock-raising.
20. The improvement of the breed of domestic animals;
21. The support, conduct, and maintenance of colleges of learning, or for any literary or scientific object, or for the promotion of any of the sciences or fine arts;
22. Acquiring, preserving, and conducting public libraries.
23. The organization and conduct of Chambers of Commerce, Boards of Trade, and Mechanic Institutes.
24. The support, conduct, and maintenance of homes and schools for orphans and foundlings, or either of them, or any person otherwise destitute;
25. For the purposes of religion, sociability, charity or learning;
26. The purchase of lands for and the maintenance of cemeteries.
27. For banks of discount and deposit.

[How corporations may continue their existence under this Code.]

237. Any existing corporation formed under any law of this State, for any purpose designated in any subdivision of the preceding section, may, at a meeting of its members or stockholders, called for that purpose, continue its existence, under Title I of this Part, or under the provisions of any subsequent Title particularly applicable thereto, as follows:

1. Public notice of such meeting, and of its object, must be given by publishing the same in a daily newspaper for two weeks, or a weekly newspaper for four weeks, successively, published in the county where the principal place of business of the corporation is. In lieu of the publication personal notice may be given to each member or stockholder thereof;
2. Two-thirds of the members if there is no capital stock, and if there is a capital stock, then stockholders representing two-thirds of it, must vote in favor of such continuance;
3. A copy of the proceedings of this meeting, giving the names of all persons present, the votes taken, the notice calling the meeting, and the proof of its publication or service, all duly certified by the President and Secretary of the corporation, must be filed in the offices of the Secretary of State and Clerk of the county where the articles of incorporation are on file. Thereafter such corporation is possessed of all the rights and powers, and subject to all the obligations, restrictions, and limitations provided in this Part applicable thereto, and its corporate existence is continued.

[Existing corporations not affected.]

238. No corporation formed or existing before twelve o'clock, noon, of the day upon which this Code takes effect, is affected by the provisions of Part IV of Division First of this Code, unless such corporation elects to continue its existence under it as provided in Section 237; but the laws under which such corporations were formed and exist are applicable to all such corporations, and are repealed, subject to the provisions of this section.

[Name of instrument creating corporation.]

239. The instrument by which a private corporation is formed is called "articles of incorporation."

[Articles of incorporation, what to contain.]

240. Articles of incorporation must be prepared, setting forth:

1. The name of the corporation;
2. The purpose for which it is formed;
3. The place where its principal business is to be transacted;
4. The term for which it is to exist, not exceeding fifty years;
5. The number of its Directors or Trustees, and the names and residence of those who are appointed for the first year;
6. The amount of its capital stock, and the number of shares into which it is divided;
7. If there is a capital stock, the amount actually subscribed, and by whom.

[Certain Corporations to state further facts in articles.]

241. The articles of incorporation of any railroad, wagon road, or telegraph organization must also state:

1. The kind of road or telegraph intended to be constructed;
2. The place from and to which it is intended to be run, and all intermediate branches;
3. The estimated length of the road or telegraph line;
4. That at least ten per cent. of the capital stock subscribed has been paid in to the Treasurer of the intended corporation.

[To be continued.]

Last month Salt Lake City received 14,000 tons of freight by the Utah Central, which connects the city with the Pacific roads.

The naphthalization of air, to convert it into an illuminating gas, was the invention of an English chemist in 1847.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhi-
bition of 1862 awarded the Prize Medal, and Gold
Medal at the Mechanics' Institute Fair, 1871, of San
Francisco.

The Pacific Stone Company call the especial attention
of Architects, Engineers and the public in general, to
the SUPERIOR QUALITY of the Stone now being man-
ufactured by them in this city under the Ransome
Patents. They make to order and keep in stock:

Building Fronts, Water Pipe

Sinks, Monuments, Fountains,

Tiles, Copings for Walls,

Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grind-
stones, all of which we guarantee superior, and at a
price far below that of hand-cut work.

The attention of private parties intending to build is
respectfully solicited.

Office, No. 10 BUSH STREET, San Francisco.

EUCALYPTUS.

The attention of the Medical profession is respect-
fully called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful inobstant cases of intermittent and Marsh
Fever, often supplanting the use of Quinine. The
paroxysms of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Blad-
der it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus
THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves
in a palatable form and elegant appearance. Dose—
One tablespoonful, to be repeated as often as the case
demands.

Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

Chemical Apparatus,

Having been engaged in furnishing these supplies since

the first discovery of mines on the Pacific Coast.
Our Gold and Silver Tables, showing the value
per ounce Troy at different degrees of fineness, and val-
uable tables for computation of assays in Grains a
Grammes, will be sent free upon application.

JOHN TAYLOR & CO.

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates,
for Saving Gold.

Of all sizes and in any quantity, furnished to
order. Full instructions sent for operating.
Particular attention given to plating goods for
Builders, Plumbers, etc. Hotel and Restaurant
work replated.

SAN FRANCISCO GOLD AND SILVER PLATING WORKS,
655 Mission street, San Francisco.

2v25-3m **E. G. DENNISTON,** Proprietor.

To Mill Men and Miners.

I am now manufacturing

CYANIDE OF POTASSIUM,

Which I can sell upon better terms than any other
dealer on the Pacific Coast.

I make three grades or qualities to suit the require-
ments of different consumers.

I will be glad to furnish prices to any person ad-
dressing me on the subject.

HENRY G. HANKS,

Manufacturing Chemist,

PACIFIC CHEMICAL WORKS, SAN FRANCISCO

24v25-1f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces
the pulp, to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Sellers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco

Richardson & Co., Copper Ore Wharves,
SWANSEA.

RICHARDSON & Co. have been for thirty years established
in Swansea as Agents for the preparation, Sampling, Assay-
ing, and Sales of Copper, Silver, Gold, Lead, Zinc, and al-
other Ores and Metals, for which they have extensive Ware-
houses and Wharves under cover, 1,000 feet of Quay Front-
age within the Floating Dock, and the most complete Ma-
chinery and Appliances. They are also prepared to make
advances against Ores in anticipation of realization, and to
guarantee all payments when required. 17v21-1y

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE

Caution Against Fraud.

The success of this most
delicious and unrivaled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having been
supplied with a spurious Worcestershire
sauce, upon the wrapper and labels of which the names
of Lea and Perrins have been forged, L. and P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' SAUCE, and see name on
wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worces-
ter; Croese & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. 15v24-1f

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.

By Special Dispatch, Dated Washington, D. C., Jan. 21st, 1873.

FOR WEEK ENDING JANUARY 7th, 1873.

BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES.—Eugene Moreau, S. F., Cal.
HANGING-DOORS.—Godfrey Heegler, S. F., Cal.
TRACK-CLEANER.—Andrew J. Gove, S. F., Cal.
PHOTOGRAPHIC PLATE-HOLDER.—Joseph Buchtel, Portland, Og.
LUBRICATOR.—John M. Power, Port Discovery, Washington Ter.
WASHING-MACHINE.—Amandrin M. Olds, Greeley, Colorado Ter.

New Incorporations.

AMERICAN MILL MANUFACTURING CO.—Jan. 16. Object: To manufacture woolen and cotton goods of every description, also machinery, castings and iron work of every description for the manufacture of the same. Capital stock, \$500,000, in shares of \$500 each. Trustees—Thos. H. Reynolds, Wm. B. Smith, Robert A. Marden, John H. Harney and Thomas Penman.

SAN RAFAEL COPPER AND SILVER M. CO.—Jan. 22. Location: San Rafael Mining District, Lower California. Capital stock, \$3,000,000, in shares of \$100 each. Trustees—S. A. Raymond, A. A. Albertson and Thomas Rogers.

PACIFIC AMERICAN SILK MANUFACTURING CO.—Jan. 18. Object: To manufacture silks of every description and fineness, and goods in whose fabric silk forms a constituent element, from the raw material, foreign or domestic. Capital stock, \$500,000, in shares of \$100 each. Trustees—Joseph Godchaux, E. Gauthier, Edward Martin, Gustave Touchard, Phillip Mesgher.

Meetings and Elections.

KNICKERBOCKER M. CO.—Jan. 17. Trustees—Robert Sherwood, W. F. Myers, J. E. de la Montagne, O. Dickinson, Jr., and John O. Hanson. Following is a statement of the Company for the fiscal year, ending on the third Friday in January, 1873:

Receipts—Balance cash on hand, January 19th, 1872, date of the last annual meeting, \$7,057.42; receipts from January 19th, 1872, to date, \$56,031.52. Total, \$73,088.94. Disbursements—For the year ending January 17th, 1873, including erection of hoisting works, \$59,386.33. Balance cash in Treasury, \$13,702.61.

Assets—Cash on hand, \$13,498.61; hoisting works and buildings, valued at \$13,498.61. Total assets, \$27,200.77. Liabilities—Labor and materials due at mine to date, \$1,500.

Surplus over all liabilities, \$25,700.77.

PACIFIC QUARTZ MINING COMPANY. Jan. 17. Trustees—E. J. Wilson, G. Palache, C. E. McLane, C. Hartson and S. Brown. The Trustees subsequently elected the following officers: E. J. Wilson, President; G. Palache, Vice-President; C. E. McLane, Treasurer; E. Wheaton, Secretary.

INCREASE OF CAPITAL STOCK—KENTUCK M. CO.—Jan. 16. Increase of capital stock from \$400,000 to \$500,000.

LYNN M. & M. CO.—Jan. 16. Capital stock increased from \$2,000,000 to \$3,000,000.

ST. PATRICK G. M. CO.—Jan. 22. Capital stock increased from \$500,000 to \$2,000,000.

A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing gut title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press. 1 amp

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Mining and Scientific Press office, S. F. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, \$10 (in coin); in leather, \$12. Forwarded by mail, in cloth, \$11.40; in leather, \$13.75. Issued and for sale by DEWEY & CO., Patent Agents and Publishers Mining and Scientific Press, S. F.

SEND FOR THE NEW YORK ARGUS, an illustrated, independent Democratic Newspaper, devoted to Choice Literature, Romance, News, Fashions, Agriculture, Horticulture, Arts, Science, Finance and Commerce. Subscription price, \$2.00 per annum, in advance. Prospectus and sample numbers FREE. All communications should be addressed to C. F. STYLES, Publisher, Post Office box, 5, 165 New York.

PACIFIC MINERAL LAND OFFICE—HOYT, SEARS & McKEE—MERCHANTS' EXCHANGE, CALIFORNIA STREET, SAN FRANCISCO, CAL.—Mining Patents obtained for claims in California, Nevada, Utah, Arizona, and elsewhere. Plans and papers prepared for adverse claimants, as required by the new law; relocations effected where claims have lapsed under the Congressional Act of May 10, 1872; Mining Contests conducted before the Departments and Courts.

Mr. McKee's experience as Chief of the Mining Claims Division, General Land Office, Washington, D. C., will be valuable to parties desiring to properly appear either as claimants for patents or as adverse claimants. Cases attended to in person at any of the District Land Offices, or at the Departments at Washington, where deemed necessary. JAS. T. HOYT, W. H. SEARS, O. H. McKEE. 1725-3m

WONDERFUL CURE.—A young man, a resident of this city, gives us the facts of the following remarkable cure. He says: "I suffered with Catarrh in its worst form. Bones came from my nose; my breath became offensive; I was compelled to eat alone. I had given up all hopes of being cured. At this time met Dr. E. W. E. of Chicago, who had been cured by a remedy discovered by himself. I tried the remedy, with little faith; but at the end of three months found myself cured." Our informant has now associated himself with the discoverer in the manufacture of the article, which will be known under the name of the Diamond Catarrh Remedy. Price 50 cts.; sent by mail for 60 cts. A. F. EVOY & CO., No. 9 Post street, San Francisco. Sold by all druggists. 26725-3m

HALLIDIE'S PATENT ENDLESS WIRE ROPEWAY.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN—My dear Sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks' trial upon our mine, the unanimous verdict of all who have seen it is a complete and most successful one. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.

Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been in operation for some time, and in a most satisfactory manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ore or other places impracticable for wagon roads, etc. Respectfully, L. W. GOLDBATH, Superintendent.

EMMA HILL CONSOLIDATED MINING CO.

Superintendent's Office, Oct. 28, 1872.

T. M. MARTIN, Esq.—Sir: With pleasure I testify to the fact that the Emma Hill Ropeway (HALLIDIE'S PATENT) built by you for this Company, has been in operation for some time, and in a most satisfactory manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ore or other places impracticable for wagon roads, etc. Respectfully yours, WM. C. CAMPBELL, Clerk of Co.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 3,000 and 4,000 feet in length, and is supported by thirteen stations. The fall in the distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one t and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. The wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or by letter, Postoffice Box 942. HALLIDIE, Patentee, 112 and 114 California Street, SAN FRANCISCO.

Wire Rope for hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 112 and 114 California St.

of works, Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of January, 1873, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in full coin of the United States, to the Secretary at his office, Room 5 and 6, No. 302 Montgomery street, San Francisco, California. Any shares upon which said assessment shall remain unpaid on Wednesday, March 19th, 1873, shall be deemed delinquent, and will be duly advertised on Saturday, March 22d, 1873, for sale at

Hardy Coal Mining Company—Location
of works, Coos County, Oregon.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 15th day of November, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Thomas Hardy.....	7 (New)	75	\$37 50
Thomas Hardy.....	8 (New)	10	9 50
Thomas Hardy.....	18 (New)	135	77 50
Thomas Hardy.....	34 (New)	29	14 50
Thomas Hardy.....	35 (Old)	31	15 50

And in accordance with law, and an order of the Board of Trustees, made on the 10th day of November, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 5, No. 338 Montgomery street, San Francisco, California, on Saturday, the 18th day of January, 1873, at 11 o'clock a. m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary.

Office, Room 5, No. 338 Montgomery street, San Francisco, California. de28-31

POSTPONEMENT.—The above sale is hereby postponed until Jan. 28th, 1873, at the same hour and place. By order of the Board of Trustees.

DAVID WILLCOX, Sec'y.

Ivanhoe Silver Mining Company—Location
of works, Elko District, Lincoln County, Nevada.

Copper Mining in Australia.

Mr. Anthony Trollope, writing from Adelaide to the *Daily Telegraph*, has referred to the Wallaroo mines, and as a paper has recently been received in this country from the superintendent of these mines giving further particulars, it will not be uninteresting to refer to them at greater length. The paper which we speak of was sent to the secretary of the Geological Society in Cornwall, and the museum of that society has been greatly enriched by a present of copper ores from this district, from Mr. Higgs, Jr., the superintendent; the specimens being described by Mr. Warrington Smyth, as something perfectly new in mineralogical cabinets. We shall first hear what Mr. Anthony Trollope has to say upon the subject. He says: "The South Australian copper of the present day—that by which one hears of this man making his 40,000 a year, and that other man winning his 50,000—is the copper which comes from the Yorke peninsula, a jutting territory somewhat in the shape of Italy, which lies between Spencer's Gulf and Gulf St. Vincent. Here are the Wallaroo mines and the Moonta mines; here also are the Wallaroo smelting works; and here is the mining pride of South Australia. These "diggings" were in the first instance discovered by shepherds, who by chance found copper on the surface of the soil. This happened first at Wallaroo, in 1860, and then at Moonta, ten miles distant from Wallaroo, in the subsequent year. Since that time four towns have sprung up, called Kadina, Wallaroo Mines, Wallaroo Port, and Moonta Mines, which among them contain about 17,000 people. The average wages at the mines are from 35s. to 38s. a week. In the smelting works at Wallaroo Port the average wages are 42s. a week. The smelters have generally come from Wales, and the miners from Cornwall. No laborer unused to mines would find employment below ground, so great and sufficient has been the influx of miners. I saw aborigines working here on surface work, and receiving 4s. 3d. a day wages. I was assured that they came regularly to their tasks. I call attention to this because it was the only instance I had found in Australia in which the native blacks were reported to have worked regularly. Copper has been found widely scattered through the colony. I find a list of seventy "reputed" mines to the end of 1870, of which all except six, were supposed to produce, or at least to contain, copper. These "reputed" mines are claims as to which applications made to the Government have been entertained, and for which the Government is entitled to charge a rent. No doubt many of them are not worked. In regard to some of them it must be said that the distance from the seaport is so great that they cannot be worked profitably till railway accommodation shall have been extended. The great wealth of the Wallaroo and Moonta mines arises from their proximity to the sea."

Mr. Higgs, the superintendent of the Wallaroo and Moonta Mines, tells us that Yorke's Peninsula is about 15 miles long, and varies in width from 25 to 50 miles; that it is entirely destitute of fresh water except in three or four places on the sea-shore, where wells have been sunk, and a brackish water found, which, for want of better, the cattle drink. The country from the Hummock's range of hills, situated at the head of the peninsula to the extreme south point, is nearly a dead level, undulating slightly in one or two places. The only natural vegetation is a stunted mallee tree scrub, and a coarse grass which grows rapidly, but when a South Australian sirocco comes, it is quickly burnt off, making the country a wilderness. The native population, he says, is small, and never exceeds 350. He accounts for the smallness of the tribe by the scarcity of water, and the same reason may also account for the smallness of the native population in so many parts of Australia. The climate is a most trying one, and in no part of the world are the ranges of temperature so great. Often in the daytime a difference of 40 degrees may be noted. The hot winds and dust storms hurled along from the dry parched plains of the north, are at times almost unbearable, and to work during their continuance is out of the question. All nature seems gasping, and the birds soon succumb to their baneful influence. The rainy months are June, July and August. The surface-rock, or crust of the country, and some of the overlying rocks, are of very recent formation. As a rule, the rock of the district is a clay-slate, overlaid by a bed of unconformable limestone. In one or two places there is an overlying rock on the clay-slate of very recent tertiary formation, intensely hard, and which makes very excellent building stone. But even this recent formation has the same overlying bed of limestone. On the sea-shore of the east coast of Spencer's Gulf from Parara to Black Point, one might almost say that a bed of this tertiary rock is to be seen gradually forming, for the fossils in the rock itself are identical with the shells and crustacea, and other living organizations to be seen and found on the sea-shore. Midway between these two points in the sandstone formation is a large deposit of phosphate of iron. At Black Point the clay-slate protrudes, and here are to be seen several promising copper lodes which, when the metal commands a high price, will no doubt be profitably worked. The same recent formations of rock are to be found all the way down the coast, the clay-slate being occasionally exposed,

Crossing the peninsula about midway between the two gulfs at Boor's Plains, is the lot of hard tertiary rock previously mentioned. It appears to be of older formation than that just described. It is quarried for building purposes, but not to such an extent as to enable one to decide how it lies in connection with the clay-slate. The bed of unconformable limestone that is overlying the whole of the land of the peninsula varies in thickness from a mere crust to 3½ feet. In places it is intensely hard to break through, but in others it is very friable. As a rule, immediately under it is a bed of clay from 3 to 12 feet in thickness, and occasionally the rock is struck immediately under the limestone. With regard to the mineral deposit, indications of copper in the peninsula were observed in 1859 by a gentleman who then held the district as one of his outlying sheep runs. He picked up on the beach, near the site of the present smelting works, some green ore (malachite of copper) and he was convinced that deposits of this mineral existed inland. It was not, however, till after much labor that he succeeded in the following year in discerning it. One day, when exploring one of the dense mallee tree scrubs, he came across the workings of a wombat, and turning over the debris of the hard limestone which had been so patiently dug through by this extraordinary animal, quite a burrow of green ore was found. Pits were quickly laid down, and very soon the back of the great Wallaroo lode was laid open and its course traced up. This discovery was quickly followed by others of equal importance. Such, then, is the true origin of the discovery of copper in this district, which so soon had to play so important a part in the world's market for this particular metal. The main bearing of all the productive lodes in Wallaroo is from 20 to 24 degrees south of east and north of west, and up to this time no copper in quantity has been found in any lode much out of this bearing. The lodes warp up in places considerably, and just at the angle of their so doing they are most productive. If they continue in a straight line, with smooth walls, they soon become poor. The great Wallaroo lode for the greater part dips south at an angle of 15 degrees, but in one place where it has been very productive it is almost vertical. The underlay here, if any, is slightly to the north. It is worthy of note that where the lode is vertical the quality of ore is much richer (2½ per cent. produce at least), than where it takes an underlie. Mines lode dips north at an angle of about 12 degrees. The same remark as to the increased richness of the ore when the lode takes a downward course applies also to these veins. The Wallaroo main lode has been worked on for rather more than 2½ miles in length of ground in all cases productive. It has been laid down as an established fact, that unless the clay-slate carries with it a considerable quantity of mica, or, indeed, unless it assumes almost the character of micaceous, the lodes will not carry copper in payable quantities. Hence one of the reasons of the occasional non-productiveness of the Wallaroo lodes, and the cause of many disappointments; and the cause of disturbances in the lodes are the numerous slides and faults. The slides are most irregular, and the principal ones have a tendency to throw the mineral deposits westwards. This is now plainly shown in the deepest workings at 120 fathoms, where the main shute of ore is carried away bodily by a slide. At the point where the lodes are cut off by the slides they are most productive, and the same thing is observable when they are picked up again on the other side of the slides. The lodes are not rich in either earthy or metallic minerals, save copper. All the lodes in this district have been found by surface indications, either from green ore being thrown out by the wombats, or forked up by some of the burrowing insects. This green ore is almost invariably a malachite, sometimes the copper is found in the form of grey sulphide adhering to the limestone crust, oftentimes coated over with a layer of lime. In the former case the lode can easily be traced up, and the ore easily taken away, for the ground is generally very soft. The green ore goes down, as a rule, about 13 fathoms, when it changes to black oxide, and very soon after, say 5 fathoms, to the usual sulphide of copper, more or less mixed up with iron pyrites. If the lode is very productive, the iron pyrites give way entirely to the more valuable associate. One thing to be noted respecting these iron pyrites is, that they are generally on the productive lodes and found on the hanging wall, so that when dressing ore they are easily picked out; when the surface ore takes the form of grey sulphide it soon changes to a red oxide, not unfrequently mixed with malleable copper, and that soon changes to the sulphide of copper, perhaps at an average depth of 12 fathoms. The surface deposit from a lode of this sort is much richer than where the back forms a malachite, the percentage in one case averaging 20 per cent., while in the other 10 per cent. would be considered good; but this difference of quality as regards surface ore does not hold good with the sulphide under. The quality under both would be about the same. The size of the lodes vary from 20 feet to 1 foot wide. The great shute of ore in the Wallaroo mines at the 40 fathom level was 16 feet wide, of solid ore of 12 per cent. produce. The water in the mine is very salt. Fortunately for pit work there was no free acid in it, and hence little inconvenience was felt. This water, however, corrodes the boilers very quickly, and they have to be cleaned every six or eight weeks. It is estimated that over 250,000 tons of 12 per cent. ore has been returned from this district since the first sales in 1861 up to the present time.—*The Mining World*.

Machinists and Foundries.

SAN FRANCISCO, CAL.

Sketch of Delaney's New Patent Cushion.

DESCRIPTION OF ENGRAVING.

E, pin or regulator, extending into rail; D, steel wire,
tending from pin into and through rubber cushion; B, rub-
ber cushion; U, is end of rubber cushion; A, lining.
Their construction is of the simplest kind, thus making
no heavy expense for suppositions elaboration. The im-
provement is a steel wire running lengthwise, and commu-
nicating with a pin at each end and inside of the rail;
the wire is imbedded in the rubber cushion, near its edge or
surface. The pin mentioned is controlled and operated
upon by a key, regulating the tension of the wire, accord-
ing to the necessities of the case. It keeps the edge of the
cushion straight and sharp. It prevents the rubber hard-
ening from the impingement of the ball; and, above all
other considerations, the angles are bound to be perfectly
correct.

The ball never lumps from the table, however severe the
stroke. It makes no noise when leaving the cushion.

Nine cushions are made upon our tables with the same
degree of force requisite to make six up on any other.

These unrivalled cushions are self-protective, and will re-
tain their elasticity either in hot, cold, dry, or damp weather,
almost forever.

Thousands of Delaney's cushions have been introduced
throughout California and the Great West, where the
largest billiard manufactories now make exclusive use of
them, to the eminent satisfaction of their patrons.

Sole Agents for the Pacific States, China, Japan, Sand-
wich Islands, and Australia.

JACOB STRAHLE & CO.,

What is Wealth, or Fame, or Life, Without Health?

Persons afflicted with any Disease, helped or not by other treatment, should consult DR. AIKIN, who effects many astonishing cures, and treats, with unequalled success, all those serious, old-standing diseases (not understood or well treated by the family physicians or others), and performs the more difficult, particular operations in surgery.

The Approved, Scientific Treatment given by

DR. AIKIN

UPPER RESCENT AND CHRONIC DISEASES OF THE
 Eyes, Ears, Throat, Lungs, Heart, Nerves,
 Stomach, Liver, Kidney and Blood; including
 Catarrh, Deafness, Discharges from the Ears,
 Failing Sight; Sore, Weak, or Inflamed Eyes;
 Cough, Bronchitis, Consumption, Night Sweats,
 Epilepsy, Palsy, Nervous Affections, Debility,
 Neuralgia, Rheumatism, Dyspepsia, Piles, Dropsy,
 Scrofula, Fever Sores, Skin Diseases, Erysipelas,
 Corpulence, Gout, Hare-Lip, Fistula, Rupture, etc.

Ladies out of Health, assured of Speedy, Safe Cure.

Cancers and Tumors easily removed; also, Wens, Warts, Enlarged Testicles, and Disfiguring Marks.
 Young or old, desiring to attain and preserve full health and vigor, no matter what they have read or doctored, first or last, will be given conscientious counsel and reliable aid, without quackery or deception; and those affected with blood or other diseases, who would avoid mercury, poisons, or nauseous drugs, can be sure of obtaining of DR. AIKIN the most efficient treatment by mild remedies, and a rapid, thorough and permanent cure. Those visiting this city (travelers, miners, and others) are advised to consult DR. AIKIN for skillful and satisfactory treatment of any case, medical or surgical. Terms reasonable. Medicines, etc., supplied. Patients, of every class, can rely on the most careful attention and best results. Do not suffer or delay, nor use the worthless, injurious patent medicines.

Whatever your disease or circumstances, or doctoring in vain, do not despair, for you can here be certain of relief if ever curable.

Come prepared to arrange requisite treatment.
 Office hours, 9 to 3, and from 4 to 8. Sundays, 12 to 2.
 Call, or write symptoms carefully, and send (by registered letter, P. O. order or Draft) \$10 to \$50, according to case, for advice and supply of Remedies by Express.

FRIEL'S PARAGON VAPOR STOVE.

PATENT APPLIED FOR.

The Great Labor Saver of the Household.
 ECONOMY, CONVENIENCE AND SAFETY COMBINED.

JUST THINK OF IT—
 No Wood, no Coal, no Gas, no Stove Pipe, no Chimney, no Smoke, no Ashes, no Dirt, no Wood Boxes, no Coal Scuttles, no Kindling Wood, but a Friction Match, and the Fire in Full Blast in Half a Minute!

OVEN HOT IN TWO MINUTES.

Steak broiled in seven minutes! Baked Beans in thirty minutes! The fire extinguished in a moment! And the house unheated! It has no rival in all kinds of Cooking and Flat Iron Heating, and combines Economy, Convenience, Neatness, Safety and Durability! The Ladies Welcome it; a little CHILD can operate it, and

ALL RECOMMEND IT.

Prices from \$6 to \$25, according to size.
 Manufactured and sold by

WM. FRIEL,

69 and 71 Fourth Street, San Francisco.

PROPOSALS FOR

Material and Work

FOR A PORTION OF

THE NEW CITY HALL BUILDING.

OFFICE BOARD CITY HALL COMMISSIONERS,
 San Francisco, Nov. 25, 1872.

Sealed proposals for furnishing certain material for a portion of the New City Hall Building and Hall of Records, and for the construction thereof, will be received at the office of the Board of City Hall Commissioners, corner of McAllister and Leavenworth streets, until 12 o'clock M. of FRIDAY, the 24th day of January, A. D. 1873, viz:

5,000 Barrels Cement;

Rolled Iron Joists;

Iron Girders and Columns;

Fixing, Fitting and Laying Iron Joists and Girders.

All according to the Printed Specifications, Schedule, etc., and Plans and Drawings.

The Printed Specifications and Printed Forms of Proposals can be had on application to the Secretary, and the Plans and Drawings can be seen, and all further information—as to details of the work, etc.—can be obtained from the Architect, at the office of the Board of the Bids must be indorsed for the Material proposed to be furnished or Work done, and addressed to the Secretary of the Board.

No Bid will be entertained unless made on the specified "Printed Forms of Proposals," and accompanied by a certified check or bond, with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, to be returned on the due entering into the contract of the party to whom it may be awarded, or to be forfeited if the party fail to enter into the said contract.

The Board reserve the right to reject any and all bids. Payments will be made monthly, in "City Hall Warrants," of 75 per cent. of the estimated amounts due, and the remaining 25 per cent. when the contract is completed.

P. H. CANAVAN,

JOS. G. EASTLAND,

CHAS. E. McLANE,

Board of City Hall Commissioners.

Notice of Postponement.

The time for receiving Proposals, as above, is hereby extended to 12 o'clock M. of SATURDAY, the 15th day of February, 1873.

P. H. CANAVAN,

JOS. G. EASTLAND,

CHAS. E. McLANE.

The Movements of the Stars.

The second lecture upon this interesting subject was delivered by Prof. J. Le Conte, on Jan. 25th.

The ancients supposed the stars to be incorruptible, eternal, and fixed in their conditions. Modern astronomers have shown that change, which is so indelibly stamped on all things earthly, is also the great law of the universe. The appearance of new stars, the disappearance of old, and important physical changes in old and well known celestial orbs is now well established.

Not only have physical changes been demonstrated, but, it has been proven that

The Great Law of Gravitation

Also extends throughout every part of the universe. Modern instruments have shown that there are in reality no "fixed" stars—their apparent fixedness results only from the fact that their immense distance renders their motion imperceptible except to the most perfectly constructed instruments.

Colors of the Stars.

Even to the naked eye, a marked difference is apparent in the colors of different stars. The different shades of color are much more apparent when viewed by the aid of proper instruments. Some very remarkable and very suggestive facts are also connected with variations in the color of stars. It is found that white, red and yellow are the colors generally found among single stars, blue and green are restricted to multiple stars. This variety of light in binary stars or suns must be productive of most remarkable phenomena on the surface of any planets which may be circling around them. Days of alternate color must come and go. When a green sun rises, the light will be green until by the subsequent rising of its red companion the two lights will be blended, until the setting of the former, when a red day will set in. At those seasons when the suns are on opposite sides of a planet, red and green days will alternate, without any intervening night; and at the intermediate epochs, all the various durations of ruby, emerald and white periods will diversify the days. The imagination will find here a domain into which graceful faucy may make excursion.

Proper Motion of the Stars.

Another very interesting subject of inquiry in the physical history of the stellar universe, is the proper motion of the stars. The difference of their proper motions will inevitably mingle the constellations in a few billions of ages. The magnificent Southern Cross will not always shine in the heavens exactly in its present form; for the four stars of which it consists, move with unequal velocity in different paths. By the procession of the Equinoxes, the Celestial Pole does not always occupy the same place in the starry sphere.

In about twelve thousand years the lesser Bear will rise in the northeast, culminate over the heads of our successors and set in the northwest, "while the Beautiful Harp will take its station in the northern watch-tower, furnishing a far more brilliant pole star than the one which we enjoy."

Motion of the Solar System in Space.

Careful observations have rendered it morally certain that our own sun with its system of planets and moons is moving through space with a velocity of nearly twenty times that of a cannon ball. But reasoning from analogy, we cannot suppose that this motion is in a direct line. The sun must follow the universal law of rectilinear motion. It must therefore be admitted that our solar system is moving around its central sun, and we naturally ask, What is the nature of its path? Is it a mighty curve? Shall we ever be able to trace out an arc of the solar orbit, and indicate the direction in which the preponderant gravitation of the sidereal firmament is urging our central

luminary? If so, what is its vast radius, where is its centre, and what the duration of the grand solar year?

The problem is unquestionably resolvable; Stellar astronomy is slowly and surely accumulating the materials for its solution. But a countless series of ages may, perhaps, elapse before the achievement of so magnificent a triumph of inductive science will be completely realized.

Improved Appliances for Ventilating Deep Mines.

[Written for the Press by DR. A. BLATCHLY.]

To insure the ventilation of shallow mines which are opened only a few hundred feet below the surface, no great amount of care or high degree of skill is required. The heat at

on the same level, but if one is considerably above the other the movement will be much more active. This system of ventilation will allow working to as great depths as any mines have been opened. Even where drifts and winzes are run as at *O, O, O*, and both drifts open into the same shaft a considerable current of air will be found, sufficient to work when the ground is not very hot.

But when it is required to run a drift as at *D*, from the bottom of the shaft through very hot ground the greatest difficulty is experienced. To cool a drift like *D* I should divide it by a partition through the centre, and connect each with one of the divisions in the shaft, and this would cause a current that would tend greatly to cool the drift; this division has long been practised in shafts, but it is equally efficient in a drift. By building the bottoms of the cages as open as possible and providing them with iron rods, feathered with light sheet-iron, as

METHOD OF VENTILATING MINES.

that depth is not much greater than at the surface and only fresh air for the miners is required. But when the depth is from one to two thousand feet, as in the deepest openings of the Comstock lode at Virginia, the whole earth is too hot to admit of working unless it is cooled from above.

Where the mine is fully opened with several shafts properly connected below, the natural movement of the air effects this cooling without any expenditure of power. But where from any cause this is not done, blowers and fans of various patterns are employed, which are run by steam engines. I propose to describe two methods of ventilation, the first of which, so far as I know, is novel; the other was invented by Ewbank over twenty years ago. Each is simple, utilizes waste power, and is self-acting.

Our engraving represents a section of a mine. *A* and *B* are shafts which extend vertically to the surface and where they are connected as by the drift *E*, there will be a constant current of air, even if the mouths of the shafts are both

shown at *G*, when the sheet-iron plates are vertical the air passes freely through the bottom of the cage, but when the plates are turned horizontally the bottom of the cage acts in the shaft like a piston in a cylinder, and in its descent forces a large body of cool air into the drift, and the cage in the other apartment of the shaft lifts out the hot air.

By an automatic arrangement (a ratchet and two pawls, one above and one below), when the movement of the cages is reversed, the plates are reversed and the air passes through the cages and is moved comparatively little. In this manner, when the cages are running in a shaft, ten or fifteen hundred feet deep, ten thousand cubic feet of air per minute can be forced into the drift. This would be probably sufficient to allow a drift to be worked three thousand feet below the surface, which is deeper than the great majority of mines will pay to work.

The cost of running a drift sufficiently large to be divided by a partition would not be greatly in excess of one of ordinary size, as is a well-known fact in mining that a large drift can be run relatively cheaper than a small one. In the next issue we shall give a drawing and descriptions of Ewbank's Ventilator; it is more complicated than this, but is a very efficient.

An Advancing Institution. Our Local Academy of Sciences.

We have in our midst a very deserving institution, the California Academy of Sciences, which is advancing rapidly, not only in the estimation of the public, but in material prosperity. For a number of years the members of the Academy have been striving against many disadvantages to place the association on a proper footing in the community. The great trouble has been want of finances, and in consequence there has been no means of fitting up the rooms neatly, enlarging the library or properly displaying the collections.

It is somewhat strange that among all the moneyed men in this city and State, none of them have ever made a donation of any size to this association. If they owned a building of their own where they could display the large and varied collection of curiosities which has been accumulated, it would really be a benefit to the community. The majority of these things are California and Pacific Coast productions, many of them rare, new or useful, and were they placed in a position where they could be examined by the public, much good would result from it. As it is now, they are all stowed away in boxes and barrels in a few very dusty rooms, and the members themselves are unable to see them. The location of the rooms of the Academy is an objectionable one and their appearance are not at all prepossessing. In fact, many of the members are averse to bringing a friend to the meetings because the rooms are in such a generally dilapidated state.

We are glad, however, to note, that since the visit of Professor Agassiz, the Academy has become imbued with new life; a large number of new members have been elected, many of them life members, and a goodly proportion of them well to do in the world. These new members bring others with them, and take great interest in the proceedings, as may be seen from the fact of the greatly increased attendance during the past six months. The President, Professor George Davidson, of the Coast Survey, is a "live" man and has done a great deal to create an interest in the proceedings and advance the interests of the institution. The proceedings of the association are to be found in all the learned institutions abroad, where they are highly appreciated. This Coast is as yet comparatively a fresh field for the naturalist, entomologist, geologist, conchologist, botanist, etc., and their researches here are of much interest, not only to scientific men but to the general public.

A few enthusiastic members have labored assiduously for a number of years in their different departments, and have in that time gathered extensive and varied collections of both old and new forms. These, as mentioned before, are packed away for want of room, and are therefore not available for inspection. These gentlemen, have, of course, received no remuneration for their services, which were rendered to the cause of science; and it seems but just for others who have the means, to show their appreciation of this labor by providing proper places for exhibition. The world is much indebted to science for its advancement, but people generally are too apt "to accept results, as a matter of course, without ever considering the source from whence they came. The members of this association have learned to labor and to wait, and have remained in a semi-quiet state for years hardly recognized by the community in which they reside, and they have received as rewards at home, more derision than praise.

California now, however, is like older countries, beginning to recognize the benefits of science, from which her mineral resources in particular, have received much benefit, and the time will be but short, if it has not already come, when our local Academy of Sciences will be recognized as one of the institutions of the city and State to be proud of. That this appreciation is felt outside of our borders is evident from the status which the proceedings have abroad.

CORRESPONDENCE.

Yuma County Mines, Arizona.

Our occasional correspondent, Dr. W. Bredemeyer, who has just returned from a professional visit to Arizona, gives us some extracts from his report on the Constantia Mine, near Ehrenburg, Roberts' Station, Yuma county, Arizona, and a few general notes of the country which will be interesting to our readers. The report on the Constantia Mine will give an idea of the character of the lodes in that section. Mr. Bredemeyer, says:

The town of Ehrenburg is situated on the Colorado river, about 100 miles above Fort Yuma and about 300 miles above the mouth of the river, in Arizona. La Paz, at present an uninhabited town, is situated about six miles above Ehrenburg, also on the Colorado river. From the neighborhood of La Paz, a solid range of primitive mountains runs from S. W. to N. N. E. almost parallel with the Colorado and to similar ranges east, separated by great plains from seven to fifteen miles wide. The first range ceases about eight miles north. In the middle of this range, east from La Paz, is a good and splendid pass leading to the great gold fields discovered in 1860, and ever since worked very successfully by dry washings, for the want of water. These placers begin about seven or nine miles from a town in Ferra's Gulch; from here they go easterly through various gulches to the pass. This gold is very fine in quality but coarse in appearance. I am told, that pieces from two and a half to three ounces were found here. This pass is small and narrow at first, but widens soon. The ranges north are principally granite and are the head auriferous range of this part. Those to the south are tapped by gneiss and primitive elates traversed by a great number of veins of argentiferous copper ores, consisting of sulphurets with a high percentage of silver and gold. The ground between the two ranges last spoken of, form a triangle of an area of ten miles of which the greater part is formed by low rolling hills of talcose and other elates, only broken at one point by quartz and porphyry, forming a peak. Around this peak appears large, solid quartz veins. All the rolling country is in fact full of large veins of auriferous quartz. At the foot of this mountain range, about twenty miles from Ehrenburg, are very large outcrops of very good gold-bearing quartz of great regularity, and deeply stained with oxide of iron.

The largest of these outcrops are the Constantia and Los Posos, from 8 to 24 feet in width and plainly visible for a distance of three miles; sometimes, after being plainly visible for 300 or 400 yards, disappearing for a short distance among the rolling hills, but always reappearing again. An immense quantity of quartz is in sight, showing gold everywhere. There is no place over the whole surrounding country, but that you can wash out gold.

The Constantia Lode

Has a very good appearance, and is in reality a valuable property. If situated in California it would advance to one of the first mines of the market. The Constantia is a regular solid, rich vein. The gold is distributed through the whole vein, from southeast to northwest, and so also through the whole of the present explored depth of 105 feet. To the northwest the vein appears the richest. There are places which assay over \$300 per ton, for a distance. The gold appears in two forms. In the terrigenous quartz it is very fine wherever the rock is broken. It appears coarse and solid, sometimes with pyrites of iron. A string of a reddish earthy mass contains very fine gold in great quantities. Through the whole vein, wherever this reddish, earthy mass (decomposed pyrites) appears, the percentage of gold is the highest. In this mass the assays are from \$90 to \$300 per ton. In general, all over the vein the assays will give at my lowest estimation from \$25 to \$30 per ton.

Description of the Constantia Mine.

Commencing southeast 650 feet from the northwest boundary of the Constantia, we have shaft No. 6 driven and sunk on the vein 100 feet deep. From this shaft a drift runs north eight feet; 130 feet more southeast is a small shaft 22 feet deep, from which runs a drift southeast 25 feet long, which shows the vein in splendid condition, eight feet wide and containing a high percentage in gold. From this little shaft still further southeast, 65 feet, is a shaft 90 feet deep. From this shaft at a depth of 35 feet a drift runs northwest seven feet and 50 feet southeast to another shaft, 97 feet deep, and from this shaft still 75 feet further southeast. In this shaft the hanging and footwalls are both very regular. The vein in this shaft is five feet wide. At the northwest end of the drift the vein is also five feet wide; crossing the 90 foot shaft to the southeast the vein widens to 11 feet; towards the 97 foot shaft the vein turns narrower and is at the southeast end of the drift only two feet wide. Through the whole drift its appearance is very good and shows free gold everywhere. Through the 90 foot shaft the vein widens from 3½ to 11 feet.

Seventeen feet north northwest of the 97 foot shaft is a little shaft sunk, only three feet in diameter, for the purpose of hoisting ore from

a surface drift, running 40 feet northwest, which is about 18 feet deep. Here, at the cross-point of this little shaft with the surface drift, the vein disappears, but is found again 15 feet deeper from the drift and also 15 feet further southeast; commencing on the footwall 100 feet southeast from the 97 foot shaft is another shaft 80 feet deep. Upon a depth of 50 feet in this shaft runs a drift 32 feet southwest through the footwall and another drift 12 feet northwest, which strikes the vein one foot wide. The southwest drift stays in the slate six feet deeper from the drift. The vein appears in the shaft two feet wide and reaches at the bottom of the shaft a width of six feet. This shaft is commenced in the headwall of the vein.

Nearly 600 feet further southeast from the 80 foot shaft is sunk a vertical shaft, belonging to the Los Posos mine, which strikes the vein 1½ to 2 feet wide at a depth of about 40 feet. This shaft is 100 feet deep. The vein has a fall from 45° to 50°, but dips at a depth of about 60 ft. in the 90 ft. shaft suddenly, with a fall of about 75°. In my opinion, the disappearance of the vein in the little shaft is only a springing of the vein, as the vein appears again only 12 feet south of the drift as a large *halvorkel* pointing out at its ends, and in the surface drift about 26 feet northwest of the little hoisting shaft, has a width of 24 feet of very rich gold-bearing quartz; not the whole 24 feet is quartz, but from the footwall eight feet of rich quartz, then four feet talcose slate and then again 12 feet quartz. Here the vein shows this string of a reddish, earthy mass of high percentage in gold, larger and richer than anywhere, and this is the same string that assays in the 90 foot shaft 10 or 15 feet below the surface, over \$300 in gold per ton.

The Country and Roads.

The whole area around the Constantia shows plainly a net of rich veins, parallel and crossing each other, giving a picture of a large tree laying down with a great number of branches. The whole valley is traversed by numerous little gulches, which are in many places fringed with a heavy growth of galleta and other grasses. The valley has also an abundance of ironwood, mesquit and pale-verde which, with the exception of the last, is excellent fuel for smelting or all metallurgical purposes. The roads from the mine to the mill (four miles) and thence to Ehrenburg (twenty miles) are in very good condition. The communication by steamer down the Colorado and from thence to San Francisco, also by stage from Ehrenburg to San Francisco via San Bernardino and Los Angeles is safe, regular, quick, and for the country, cheap. Material can be got just as easy and with nearly the same expense as at places in Nevada at some little distance from the railroad. The climate is healthy, and although it is pretty hot in the summer (140°) it has no influence on the work. The main road of the Poso Valley passes within four miles of the mine and one mile of the mill. I am certain that there are in the Poso Valley two underground streams of water, one of which comes from New-water, 30 miles south of southeast from the Constantia. The present well at the mill is 45 feet deep and has sufficient water to run ten stamps, two pans and settler, and for the use of the working people. The water is clean, healthy, and is free from salt. It has a nice temperature for the milling process. I am certain that there will be water enough to run a mill of 50 stamps through the whole year, and the Constantia is a mine that could and would supply a 100-stamp mill with sufficient ore at the rate of \$25 per ton.

There are here a number of miners who own valuable mines, and are only waiting for capital to start, and who would bring their ore to the Constantia mill, as it is situated in the most favorable part of the Poso Valley.

Antelope District, Nevada.

EDS. PRESS:—Having just returned from Antelope District, Lander county, in this State, and having seen some very valuable quartz mines, superintended by one of our well known pioneer prospectors, Mr. Daniel McMurchy, the original locator of the Caledonian Tunnel and Mining Co., Storey county, and being a reader of your valuable journal I think, perhaps, the annexed might be fit for publication in your paper.

The Evening Star, Highland Chief, Indian Queen, Alabama, Merrimack Monitor and Kearsarge mines, located in Antelope mining district have, since March, 1872, been discovered by the old prospector, Mr. Daniel McMurchy; they promise to be true fissure veins, well defined with good walls. The ledges run north and south and parallel with each other, the core being six to eight feet from wall to wall, while the facilities for wood and water surpass anything in the State of Nevada. The mines are located forty miles north of Eureka, or forty-five miles south of Palisade on the C. P. R. R., where a very superior road on which machinery of every kind can be delivered at the mines with cheapness and dispatch. The mines have been examined by General Cadwalader of this State, (a miner of acknowledged reputation) who reports there is more good ore in sight than in any mine he had seen in any part of this State, having every facility wherewith to make them permanent mines, and in the hands of a Superintendent such as Mr. McMurchy, who is bound to develop them to

their utmost extent, they are bound to become permanent mines. Mr. McMurchy is working with a full force of men in order to develop the mines thoroughly and secure a United States Patent. He intends to incorporate the mines in San Francisco about the 1st of April, so soon as a full development is made. Any company who are in search of "O K" mines would do well to visit Antelope district and see Mr. McMurchy, who can show them mines that are unsurpassed in this State. J. M. E.

Resources of Utah.

We continue the articles under this head from the Salt Lake Tribune:

The Mining Interests.

Utah is traversed from northeast to southwest by a great mineral belt, about seventy miles in width and several hundred miles in length, the result, doubtless, of several distinct upheavals, peculiarly well defined, and in variety of production covering a wide range of metalliferous deposits.

The development of this discovery, during the past two years is probably without a parallel in history, and the mines of Utah have taken their place in the public mind as one of the permanent industries of the country.

The minerals consist mostly of the base metals, of which lead is the chief, carrying silver, and in some cases gold, in quantity varying from a few ounces to one hundred and fifty ounces of the former metal to the ton.

Copper also occurs in various forms, and in many instances large quantities. Valuable discoveries have been made in chlorides and "horn silver," of surpassing richness, varying in actual assay value from \$500 to \$27,000 per ton. Assays have been made from ore taken from the Silveropolis mine, in East Cañon, of \$20,000 per ton, and shipments of a number of car loads of ore have yielded an average of \$666 per ton.

Ore from the Shamrock mine, in East Cañon, has assayed as high as \$27,000 per ton. Shipments have been made from this mine which have given returns of from \$1,800 to \$5,600 per ton.

The Mono mine in Dry Cañon, is also noted for the richness of some of its ores. Sales of small parcels have been made at the following figures: 400 lbs. for \$5,000, equal to \$20,000 per ton. One and one-half tons at the rate of \$2,500 per ton, and the same quantity at the rate of \$2,400 per ton; two tons at the rate of \$1,600 per ton; three and one-half tons at the rate of \$1,000 per ton, and two tons at the rate of \$650 per ton.

The names of the principal mining districts and the leading mines developed and being actively worked are as follows:

Little Cottonwood District.

This district is in the Wahsatch range of mountains and is distant twenty-five miles southeast of Salt Lake City, has always been, and still is, foremost in the rank of mining districts of the Territory. Discoveries and locations were made as far back as 1865, but no particular action towards development was taken until the discovery of the rich and enormous deposits on the Emma lode in 1869 which gave an impetus to further research and subsequent bringing to light of other lodes and deposits considered to be equally promising. This district is now pretty well prospected and is dotted all over with claims and mines being developed and worked. The hill called Emma after the famous mine of that name is being burrowed in all directions by a net work of tunnels, some of which have produced very favorable results to the owners of them.

The class of ore is argentiferous galena mixed with carbonates.

The principal mines in the district are:

The Emma, Flagstaff, Montezuma, Savage, Davenport, Hiawatha, Last Chance, Wellington, Lexington, Grizzly, Matilda, Vallejo, Titus, Highland Chief, Enterprise, Frederick, North Star and Winsor.

The principal tunnels now being run are:—the Illinois, Gladiator, Howland, Etua, Ely, Herman, Bay City, Pacific, Victory, May & Excelsior and Brewer & Lapham.

Big Cottonwood District

Is also in the Wahsatch range of mountains, and situated about 25 miles southeast of Salt Lake City.

The first discoveries were made in the summer of 1870.

The principal mines are the Davenport, Reed & Benson, Highland Chief, Wellington, Richmond, Teresa, Prince of Wales, Congress, Maxwell, Mount King, Scott, Lady Elgin, Buckeye, Jr., Panacea and Imisio.

Also on Kesler's Peak, in the same district, are the Homeward Bound and Sailor Jack, belonging to the Deseret Mining Co., the Provo, belonging to Major Meeks, and the Noon, Home Ticket and Jefferson Tunnel, the property of J. J. Noon and associates.

The general character of the ores is carbonates of lead and galena, embracing antimonial, arsenical and argentiferous qualities.

The developments in the Highland Chief and Wellington mines are being made with an Ingersoll's patent steam drill. The rock is very hard limestone, with strata of flint and quartz.

Four feet of tunneling is excavated by the drill every 24 hours.

Parley's Park District,

Also in the same range, is distant about thirty-

three miles from Salt Lake City. Its position is on the divide between Parley's Park and Provo Valley, and consists of three districts known as the Howland, Uintah and Blue Ledge.

The first discoveries were made in the Howland in the summer of 1871. The principal mines in this district are the Flagstaff, Wild Bill and Rocky Bar.

In the fall of the same year the Pioneer and Idaho were located in Uintah District, and more recently the Gregory and Porcupine.

In the spring of 1872 the McHenry was discovered in the Blue Ledge District and created at the time some excitement, on account of the extensive croppings of rich milling ore.

About the same time the Ontario was located, and still later the Dolly Varden, Highland Jennie and Cariboo, all high grade galena ores that promise exceedingly well, the veins being large and the ores assaying well from the surface.

Character of ores, both smelting and milling.

American Fork District.

This district is southeast of and adjoins Little Cottonwood District. It is distant from Salt Lake City 34 miles by road via Little Cottonwood, and 40 miles by the Utah Southern and American Fork Railroads.

The majority of the ore is high grade smelting ore, composed of galena and carbonates, but there is some very fine free milling ore in the district, as for example, the Silver Gance, where large bodies of rich ore are exposed.

The principal mine in the district is the Miller, owned by Howland & Aspinwall of New York, who have erected extensive smelting works contiguous to it, which are called the Sultana Smelting Works. The company is also constructing a narrow-gauge railroad from the works to the U. S. Railroad, sixteen miles of which are already completed.

This mine and the Silver Gance are two of the most important mines in the Territory, consisting of immense bodies of ore of very high grade.

The names of other mines in the district are the Silver Gance (milling ore), the Bullion, Mary Ellen, Terrible, War Eagle, Queen of the West, Vermont, Pittsburgh and Wild Dutchman. West Mountain mining district, commonly known as

Bingham Canon District,

Is on the eastern slope of the Oquirrh range of mountains distant twenty-five miles southwest of Salt Lake City. It and its tributaries are situated in the core of the upheaval traversing Utah. The igneous rocks prevail in this district, and the leading mines already developed are situated in the granite formations.

The limestone formations crop out on the northwestern and southeastern extremities of the district, in which milling ores and the gray carbonate smelting ores are found in great abundance. But the largest, the most continuous and the most reliable veins are found in the granite formations.

There are four distinct belts of mineral running through this district. That of the two central belts is characterized as sulphuret, carbonate and oxide ores, assaying from 30 to 70 per cent. in lead, and from 20 to 300 ounces in silver per ton. The northwest belt is of a still higher grade of mineral; the gray carbonate ores generally prevailing, and varying in assay value from forty to one thousand ounces in silver per ton, and from ten to forty per cent. in lead. The southeast belt gradually diminishes in lead assay from the northwest towards the southeast side of the belt. The ores found in this belt are generally of the class known as milling ores, assaying in coin value from a few ounces to one thousand ounces in silver per ton.

Some valuable placer claims have been worked in the main portion of this canon which have yielded an aggregate of upwards of \$1,500,000.

The first discoveries were made in 1863, by soldiers attached to the command of General Connor. In 1865 Mr. Bottsford located the mines now owned by the Utah Silver Mining Company of London.

THE HEART OF THE MINES.—Gold Hill, Nevada, may be said to be the present great throbbing heart of the Comstock lode. Into a small space between the high hills on each side of and at the head of the canon are packed the hoisting-works of the leading mines of the county, and the rush and clatter of these never ceases. Steam-whistles shriek, car-loads of ore thunder down the chutes, and at times the place seems a second Pandemonium. To look upon the town from the hills above, these frosty mornings, the whole basin below, in which lies the town, seems a seething cauldron. Great white clouds of steam rise up everywhere, almost hiding the town from view. The trains almost hourly passing through the town over the railroad, also add not a little to the floating steam-clouds and to the general din and confusion. Below all this, however, the real work is being done. Far down under the town and far beyond the reach of the faintest echo of the shrillest locomotive whistle, hundreds of men are sweltering in an atmosphere but little cooler than that popularly supposed to characterize that of the regions ruled by his Internal Majesty. Here is where the real work is done, notwithstanding all the turmoil on the surface. It is a city beneath a city, and the wonders of the lower far surpass those of the upper city. Gold Hill is a busy place, not on the surface alone, but for 1,200 feet below—we run business into the ground here.—*Gold Hill News.*

SCIENTIFIC PROGRESS.

Changes in Coal by Exposure.

The subject of deterioration, which stone coal suffers by exposure, has, of late, attracted much attention. Different coals are not equally affected by exposure; their texture, their chemical composition, and the impurities which they contain, exercise considerable influence. Under otherwise equal conditions those coals suffer most which have little cohesive strength. Gas coals, after having been long stored, make less and poorer gas than when fresh from the mine.

The Nature of the Changes

Which take place with the coal, and the conditions which influence them, still form a fruitful field for investigation. A large number of interesting experiments on this subject were made by Dr. Richter, Professor at the mining school at Waldenburg, in Prussia, which deserve to be far more widely known than they appear to be. A detailed account of them may be found in *Dingler's Journal*, 1870. Some of his principal results have been stated substantially as follows: As soon as the coal is mined it begins to absorb oxygen, rapidly at first, then more slowly. At first this action appears to be physical, but it soon becomes chemical, when the absorbed oxygen combines with the hydrogen of the coal to form water, and with the carbon, to form carbonic acid. Heat intensifies the chemical action. Powdered stone coal fresh from the mine, heated to a temperature of 350° to 400° Fahr., increased in weight; although carbonic acid and aqueous vapor are disengaged, more weight of oxygen is absorbed. After a while a rather constant weight is obtained, and by chemical analysis, the coal is then found to contain oxygen and hydrogen very nearly in the relative proportion in which they combine to water, which has not been the case in the fresh coal. The property of the coal thus rapidly to absorb oxygen depends mainly upon its proportion of free hydrogen. Of the carbon of the coal only 5 or 6 per cent. combines thus rapidly with the oxygen at the stated temperature, while the rest of the carbon is far more stable.

Different coals heated to the boiling point of water until their weight remained constant, would absorb in a humid atmosphere, at 60° Fahr., from 2 to 7 per cent. of water, and it was remarkable to observe that some solid pitch coal would absorb three times as much water as a soft laminated coal. The faculty of absorption could not be judged from the appearance of the coal, but coals from the same stratum exhibited considerable uniformity of behavior. The coals which absorbed most water were also those which absorbed most oxygen. Twenty grammes coal absorbed in the first twenty-four hours after mining from 2 to 9 cubic centimeters oxygen. Stone coal absorbs carbonate acid even more eagerly than oxygen, taking up three times as much of it. At higher temperatures, the chemical action of the oxygen is increased and a slow combustion takes place.

Air dry coal absorbs the oxygen far more rapidly than moist coal, and coal which has been artificially dried absorbs it still more eagerly, taking up at the same time some nitrogen from the air. On the other hand, humidity induces decomposition of the iron sulphuret contained in most coals, which, in turn, accelerates the chemical changes of the coal by creating heat, by causing it to split and slack, and probably, also, by inducing chemical action between the oxid of iron formed and the coal, if not between the oxygen and coal directly.

Light appears to exercise little influence. When coal has been exposed some time, and absorbs oxygen with little avidity, this absorption is a little greater in the dark. These were the principal results obtained by Dr. Richter.

CAFFEINE.—Carefully conducted experiments prove that none of the active principle in coffee—caffeine—is lost by roasting the berry to a light brown color, and only 0.144 per cent., when roasted till almost black. Nearly all the caffeine was extracted in pouring boiling water over the burnt and ground coffee, scarcely a trace being found in the "grounds." The physiological action of caffeine on the system is very similar to that of strychnine. Some are more sensible to that poison, in minute doses, than others; hence the nervous action produced by coffee or tea on some systems, and the absence of any such effects on other systems into which the same amount of coffee or tea is taken.

DETERMINING THE ALCOHOLIC STRENGTH OF LIQUORS.—It is found that in pouring an alcoholic or acetic solution from a small orifice the drops are found to be large and heavier the more alcohol or acetic acid they contain. Hence it is apparent that if the number of drops required to make up a certain volume be counted, a table may be found to show the strength of the wine, beer or vinegar thus tested. The relative strength of any two or more liquors can thus be readily determined by ascertaining the number of drops required to fill any given vessel—say a small vial.

THE CABLE FOR SCIENCE.—Mr. Cytus W. Field has placed the cable at the free disposal of the scientist of both hemispheres, for the purpose of reporting the discovery of astronomical phenomenon, such as new discoveries of planets, comets, remarkable changes in the sun, etc.

Origin of Meteorites.

The question as to whence the meteorites come is one that we are not yet in a position to answer with certainty. The various hypotheses which suppose for them an origin in lunar volcanoes, or in our atmosphere, or, again, in a destroyed telluric satellite, or that would treat them as fragments of an original planet of which the asteroids are parts, or as masses ejected from the sun—all these hypotheses seem to be more or less precluded by the known velocities, the retrograde motion so frequently characterizing meteors and meteorites, or else by the chemical conditions that, for instance, are involved in the passage of the meteorite through the sun's chromosphere. Whether meteorites move or do not move in circum-solar orbits is at present impossible to say; hence, while with our incomplete knowledge we cannot to-day attach the character of periodicity to any known class of meteorites, we are not justified in founding any conclusion on a negative result with so limited a foundation.

But even if all or some of them may have been, on their encountering the earth, members temporarily or permanently of the solar system, we may with considerable probability consider them as having originally entered our system from the interstellar spaces beyond it. Such at least must be our conclusion if we are to admit the unity of the whole class of phenomena of meteorites and falling stars. For, since the orbits of the two best known meteoric streams, those, namely, of August and November, have been identified with the orbits of two comets, and since in regard to one of these (that of November) Leverier has shown, with great probability, that as a meteoric cloud it entered and became a member of our system only some 1,700 years ago, in consequence of the attractions of Uranus, while the August meteoric ring only differs in this respect from it, that it had at a much more remote period found an elliptic orbit around the sun—we are constrained, on the assumption with which we started, to recognize also in a meteorite a visitor from the regions of remote space. And so far as it goes, the observation by Secchi that the November falling stars exhibit the magnesium lines in harmony with this view.—*Popular Science Monthly*.

CHANGES IN THE MOON.—Mr. Birt, at the last meeting of the British Association, dealt with the observation of the spots on the floor of the crater Plato in the moon. It appears that changes in the appearance and luminosity of the streaks have been detected, and these changes are of such a character that they cannot be referred to changes of illumination, but depend upon some agency connected with the moon itself, while the color of the floor was found to vary as the sun ascended the lunar heavens, being darkest with the greatest solar altitude. The reports indicate a strong probability that definite changes of an interesting character on the moon's surface will be discovered.

FILIFORM, NATIVE SILVER.—How PRODUCED. Dr. J. H. Gladstone states that this peculiar formation of silver may result in nature from the action of sub-oxide of copper on silver salts in solution; deducing the above from the facts that when nitrate of silver is precipitated with sub-oxide of copper, the precipitate appears exactly similar, under the microscope, to native filiform silver, in white fillments, shooting in every direction, and twisted or doubled back in their course. Most of these threads are so fine that their diameter is only one-twenty-five-thousandths of an inch.

RED AND WHITE BLOOD.—Blood is not always white. There is a liquid formed in the bodies of invertebrates, which is really blood, though white in color. This white blood contains nearly as large a proportion of iron as red blood does. The proportion of iron in the blood of different animals is given as follows, by Pelouze:—In 100 grammes of blood metallic iron is found in

Man.	Beeves.	Pork.	Sheep.	Turkey.	Chicken.	Ducks.	Frogs
gms.	gms.	gms.	gms.	gms.	gms.	gms.	gms.
0.051	0.055	0.059	0.037	0.033	0.037	0.034	0.042
1.054	0.058	0.051	0.033	0.034

CHANGE OF BRONZE BY LONG EXPOSURE.—*Dingler's Polytechnic Journal* describes a bronze instrument taken from a Celtic tomb, which was so disintegrated from long exposure as to present three quite distinct layers, as follows:—The first was CuS, indigo blue color and crystalline texture; the second was Cu²S, with 15 per cent. of tin; the third was Cu²S, 59.8 per cent., in a black, fine powder, tin 23.2 per cent., and 3.4 per cent. water.

VOLCANIC DUST.—The dust thrown up by Vesuvius during its recent eruption, has been ascertained to consist of aggregations of crystallized quartz dotted over with magnetic oxide of iron, also in a crystalline condition, and readily removable by hydrochloric acid. The grains were of microscopic dimensions, very uniform in size, and so small that they would readily pass through a sieve, the apparatus of which measured the 16,000th part of a square inch.

OZONE FROM SEA WATER.—The fact that the atmosphere at and near the sea shore is richer in ozone than it is in inland places has been explained by Mr. Corup Besanet, who finds by experiment that ozone is formed by the evaporation of water.

MECHANICAL PROGRESS.

Important Improvement in Fresco Painting.

The objection against wall paper and ordinary water color fresco painting is the instability of the colors, and the fact that they are not water-proof, and thus so easily damaged. In this respect the most expensive fresco is not better than the cheap wall paper. It may therefore be considered an important step in the progress of this most important art that, as we find stated in the *Manufacturer and Builder*, a Mr. Kemmer, of Newark, N. J., has devised an oil fresco painting, which is painted on a prepared sheet of muslin, and afterwards placed upon a wall like ordinary wall-paper. When so placed upon the wall it is said to be superior to the ordinary method of fresco painting. The use of scaffolding, expensive and cumbersome, in one's apartments for weeks at a stretch is avoided. The decorations can be designed according to order, executed in the shop, brought to the house, and put in place; and instead of the whole building being in confusion for weeks at a time, three or four days will suffice to complete the job. Moreover, better work can be done; the artist is not obliged to labor lying on his back or twisting his head into awkward and painful positions—often in the worst of lights.

Interior decoration is carried on principally during the summer months. Necessarily work is plentiful, skilled workmen are difficult to obtain and expenses are proportionately great. Using this process the labor can be done during the cold weather, when the best of artists are out of employment, and can be had at low wages.

Such a wall or ceiling may be washed like ordinary paint with soap and water, a proceeding which is impossible with common fresco work. The film, though thin, is elastic, and does not crack with the wall, unless very large openings appear which are generally few and susceptible of easy repair. The most elaborate designs can be prepared for any sized apartments.

The work, when finished, has all the appearance of, and in fact is, elaborate frescoing in oil, and besides being more durable and less expensive, it is equally artistic, and far more readily accomplished.

It will not peel off, as other ordinary fresco painting does so often, while the colors are very permanent, the gilding is not done with bronze powder or Dutch leaf, but with pure gold leaf, which, as well known, will retain its brilliancy, and may be washed with soap and water when put on with oil preparations, as is here the case.

Testing the Quality of Lubricating Oil.

Mr. R. H. Thurston, of Hoboken, N. J., has recently patented a device for testing the quality of lubricating oil. The invention, which affords a means of making a combined dynamometrical and thermometrical test, and also of determining, at the same time its power of sustaining heavy pressures and its durability under any required pressure, is described by the *Scientific American* as follows:

A journal, on a shaft running in a securely mounted frame, is grasped by a clamp and the boxes are set up to any desired intensity of pressure by a powerful screw compressing a spring; the pressure is known from the reading of a suitably arranged scale.

The pressure being adjusted as desired, the clamp swings about the journal and, by compressing a spring or by raising a weight, determines the exact amount of force required to overcome friction, by the reading of another scale.

A thermometer, set in the journal brass, indicates the commencement and progress of any heating of the journal. The time required to become heated and to burn off, under a given pressure, will indicate the durability of the oil where it may be exposed to such a pressure.

Several forms of machine are described for special classes of lubricants, as for heavy oils for locomotives, at the one extreme, and for the light oils used on sewing machines and other light machinery, at the other extreme.

PAPER WINDOW SHUTTERS.—The inventors who have been experimenting with paper for some time past, are now trying to make it useful for window shutters. The preparation used is the ordinary paper pulp brought by pressure to the utmost compactness and solidity, with the lightest possible sheet iron or rather casting to insure stability. This preparation has been brought to a high degree of perfection in Japan, where they are much more skillful in the uses of paper than we are, adapting it to all sorts of articles for domestic use, being, as it is claimed, water-proof, weather-proof, and fire-proof, not liable to breakage like crockery from careless handling, nor in danger of corrosion like most of the metals from exposure. The material has been used to some extent in this country for furniture, clothing, car-wheels, and many other things out of the ordinary course of things. As the stuff will not burn, the inventors expect to turn it to use as a new safeguard against fire.

Friction of Journals.

A correspondent writing from Columbus, Ohio, asks whether the friction of a large journal is greater than that of a small one, the length and character of bearing being the same in both cases, and the number of revolutions the same, the only difference being in the diameter of the journal.

The friction on any surface, whether plane or cylindrical, is proportional to the weight resting upon it and is not at all affected by the area of the rubbing surface, provided the pressure is not so great, on the one hand, as to change the character of those surfaces, nor so light on the other hand, as to make the resistance principally that of viscosity of the lubricant rather than that of true friction. In the former case, the friction may increase immensely in consequence of the cutting of the surface; and, in the latter, the increase of frictional resistance will be approximately proportional to the increase of area.

The work done in any given time, that is, the power wasted in turning any journal on its bearings, is, where the fractional resistance is the same, proportional to the speed of the rubbing surfaces, since it is measured by the product of the resistance into the distance through which that resistance is overcome. Therefore, it follows that a very large journal absorbs a larger proportion of the driving power of a machine than does one of small diameter, and in designing machinery we should make journals of as small diameter as possible without danger of breaking the shaft, or of causing abrasion of the rubbing surfaces.

Again, the tendency of a journal to heat is the greater the greater the pressure per square inch of longitudinal section of the journal, and it is increased by increasing the speed of the rubbing surfaces. Therefore, to make journals safe against heating, make them of as small diameter as safety permits; and having thus reduced their absorption of power to the lowest limit, secure bearing surface by giving them ample length. If they are, however, made so long that the shaft can spring in the journal, heating may occur from that cause; in line shafting, this will, of course, not happen. The best practice gives line shafting for mills a length of journal equal to four times the diameter of the shaft.

There are rules, known to engineers, for properly designing journals, which are based on the principles above stated.

In no case in general practice should the pressure, on even the slowest moving journals, be allowed to exceed 1,000 pounds per square inch of longitudinal section with steel journals or about 600 on iron, running in well worn boxes in each case. Special care should always be taken to provide for effective lubrication.—*Sci. Am.*

Tidal Water Power; A New and Useful Suggestion.

Mr. A. E. Gordon, the editor of the New Brunswick, N. J., *Times*, has made a suggestion in reference to the utilizing of the power of the tides, which, says the *Scientific American*, appears to us not only novel but practical and important.

The use of tidal water power to drive mills is common along our coasts. The ordinary method is to shut off the mouth of a small inlet by means of a dam having sluice gates to admit the sea water which, by the rise of the tide enters and fills the enclosure. By the fall of the tide the enclosed water derives sufficient head to drive a turbine or other wheel, and so give motion to the mill. But when the tide again rises of course the head is destroyed, so that the mill can only run alternately, during two separate periods of a few hours each out of the twenty-four. It is this alternating and irregularity in the hours of motion, together with the periods of entire inactivity, that prevent the employment of this species of motive power for general industrial purposes.

The improvement suggested by Mr. Gordon consists in providing two water basins, both of which are to be shut off by dams from the sea. One of the basins is to serve as a constant supply reservoir of water, and it is to have a close dam of such width and height that the tide water, when it has risen to within one foot of its normal height, will begin to pour over the dam and quickly fill the reservoir. The dam of the other basin is to be provided with swing valves which permit exit of the water at low tide but prevent ingress of water from the sea. This basin, we will now suppose to be empty. The water wheel is to be placed between the two basins, and the fall of the water from the reservoir into the discharge basin will afford continuous motive power so long as the supply of water lasts and until the rise of water in the discharge basin destroys the head. But as this latter basin is entirely emptied at every tide, the head will always keep good, precluding, of course, that the reservoir and the discharge basin are made of proper size. In respect to this last point, it is well known that basin capacity on our coasts is almost unlimited and there are thousands of localities where extensive water powers may be thus provided and maintained at a comparatively small cost. We trust that Mr. Gordon will proceed to elaborate his plan and place it before the hydraulic engineers of the country for discussion.

Our Weekly Stock Review.

[S. F. Stock and Exchange Board.]

THURSDAY EVENING, Jan. 30, 1873.

Mining stocks have not been very lively this week although at the latter part of it they began to look up. News from all the mines is unusually bright, however, as will be seen by reference to our Mining Summary. The depression in stocks still continues, which is supposed to be the result of tightness in the money market, and as a contemporary justly remarks, in the greatly increased number of shares afloat. Not only are more stocks dealt in, but many of the companies have lately increased their number of shares to a great extent, and more stock is offering than the market warrants. Moreover a large number of assessments have become delinquent and have been levied this month, as will be seen from the statement below. Some 24 assessments were delinquent in January, the aggregate amount of which was \$550,000, while the dividends were \$575,691, leaving a balance of only \$25,000 for the month. Dividends this month were more numerous than they have been for some time, two new companies having been added to the list of dividend-paying mines—the Diana and Consolidated Amador. The Cederburg has declared a dividend of 50 cents a share, which, however, is not payable until February.

The amount disbursed this month is larger than it has been since July. In May \$1,067,000 was paid; in June, \$882,000; in July, \$852,000; in August, \$557,000; in September, \$522,000; in October, \$210,000; in November, \$225,000; in December, \$230,000 and in January \$575,691—making since May last the sum of \$5,120,781. The assessments in that time amounted to \$3,874,760, leaving a difference of \$1,246,021 as net profit.

The total dividends on mining stocks for the year 1872, amounted to \$6,731,400, and in 1871, amounted to \$4,837,950 showing an increase of \$1,893,450. The Amador, Golden Chariot, Eureka Consolidated, Greenville, Hale & Norcross, Redington, Quicksilver, Sierra Nevada, Succor and Yellow Jacket, which paid dividends in 1871, did not pay any in 1872. The companies paying dividends in 1872 were as follows, with the total amount paid: January, Belcher, \$2,140,000; Caledonia, \$36,000; Chollar-Potosi, \$50,000; Crown Point, \$1,800,000; Eureka, \$40,000; Keystone, \$20,000; Mahogany, \$15,000; Meadow Valley, \$36,000; North Star, \$22,000; Pioche, \$40,000; Providence, \$31,000; Raymond & Ely, \$2,070,000; Yuba Gravel, \$10,000.

The following companies levied assessments during the month of January: Amelia, Ely District, 10 cents; Arkansas, Ely District, 50 cents; Anthony, Ely District, 25 cents; Buckeye, Washoe, \$1; Chief of the Hill, Ely District, 50 cents; Dauphin, Butte Co., 40 cents; Danby, Washoe, 25 cents; Eagle Quicksilver, Santa Barbara Co., \$5; Empire, Idaho, \$1; Empire, Washoe, 50 cents; Equitable Tunnel, Utah, 10 cents; Globe, Washoe, \$1; Golden Chariot, Idaho, \$2.60; Granite Tunnel, El Dorado Co.,

6 cents; Ida Elmore, Idaho, \$2.50; Imperial, Washoe, \$1; Jackson, Eureka, 10 cents; Juniata, Esmeralda Co., Nov., 65 cents; Lady Esten Tunnel, Utah, 5 cents; La Paz, Ely District, 50 cents; Lillian Hall, Ely District, 25 cents; McMahon, Seboll Creek, 25 cents; Meadow Valley, East Co., Ely District, 10 cents; Minnesota, Idaho, \$1; Mobave Cone, Arizona, 10 cents; Noonday, White Pine, 10 cents; Newark, Ely District, 50 cents; Old Providence, California, 25 cents; Ophir, Washoe, \$3; Occidental, White Pine, 5 cents; Phoenix, Eureka, 10 cents; Peavine, Ely District, 25 cents; Railroad Cone, Nevada, 15 cents; Rising Star, Idaho, \$1; Rising Star, Eureka District, 15 cents; Sanderson, California, 10 cents; Savage, Washoe, 10; Santa Cruz Coal Company, California, 20 cents; Setting Sun, Ely District, 30 cents; Spring Mount, Nevada, 20 cents; Stanford, Nevada, 10 cents; Teutoburg, Cal., 25 cents; Teutoburg, Teutoburg, Cal., \$1; Washington and Creole, Ely District, 50 cents; Yellow Jacket, Washoe, \$5; Yuba Gravel, Cal., 25 cents.

The following is a list of assessments delinquent in January:

Name.	Per Share.	Amount.	Delinquent.
Arizona & Utah.	\$1.00	\$18,000	January 10
Adams Hill Co.	25	15,000	January 22
Consolidated Virginia	30	70,000	January 20
Esta Buena Con.	25	7,500	January 22
Hale & Norcross.	5.00	80,000	January 15
Justice.	1.00	21,000	January 14
Kentucky.	10.00	20,000	January 15
Kentucky.	10	15,000	January 11
Magnolia.	25	7,500	January 15
National.	50	15,000	January 31
Orient.	25	5,000	January 3
Overman.	5.00	64,000	January 25
Petticoat.	50	10,000	January 20
Pioche West Ex.	25	8,750	January 27
Red Jacket.	10	5,200	January 10
Silver Hill.	2.00	10,000	January 23
Silver Peak.	50	15,000	January 11
South Chariot.	60	10,000	January 6
Succor.	1.00	29,000	January 6
Summit.	25	2,800	January 20
Star King.	50	15,000	January 30
Union Gravel.	1.50	12,000	January 25
Yuba Gravel.	20	2,000	January 18
The dividends paid in January from mining companies amounted to \$575,691, against \$371,000 paid in the same month in 1871, and \$337,000 in 1870. Dividends in January were as follows:			
Name.	Per Share.	Amount.	
Belcher.	53	\$312,000	
Consolidated Amador.	3	30,000	
Eureka.	1	1,151	
Meadow Valley.	1	20,000	
Raymond & Ely.	1	60,000	
Eastport Cons. Bay Coal.	1	150,000	
Total.		\$575,691	

On Friday the Stock Market was weak and prices irregular. On Saturday morning it was still dull and heavy, with a decline in prices, but showed a slight improvement in the afternoon. Broker fall \$1; Crown Point, \$1; Con. Virginia, \$3; Caledonia, \$1; Gould & Curry, \$1; Hale & Norcross, \$7; Pioche, \$1; Overman, \$6; Savage, \$6; and Yellow Jacket, \$4.

Monday there was no change in the market, everything being very dull and Tuesday it was the same.

Wednesday some little activity manifested itself and prices were a little better. Crown Point rose \$2.50; Chollar, \$1; Con. Virginia, \$3; Hale & Norcross, \$4; Overman, \$2; Jacket, \$5; Raymond & Ely, \$3.

Below will be found items of interest from prominent mines later than that in our Mining Summary.

KENTUCKY.—On the 20th two bars of bullion were shipped, worth \$4,463. About 20 tons per day coming from old level.

main shaft of the Petticoat is to be sunk 100 ft. deeper to strike a new chimney which is supposed to be dipping towards the shaft, from the south. Some stoping is being done in the 450-ft. north level. The Prussian Hill was sold at Sheriff's sale for \$6,000. Canse, an incompetent, penny wise and pound foolish Superintendent. Additional improvements, with a view to convenience, have been completed at the Sanderson mine. The Supt. is again master of the water in the main shaft; stoping and sinking have been resumed.

Mosquito District.—The Supt. of the Good Hope has been crushing low grade ore from the mine to ascertain its value. The mill is in excellent working order, now, and is very favorably situated for custom purposes—quite a number of strong veins, from 2 to 9 ft. wide, being worked within a radius of less than 1 mile. The Dolly Varden, which suspended operations during the recent rains, has resumed work. The main shaft is now 100 ft. deep. The owners intend to test the mine extensively before going to any expense for permanent purposes. The Grassopper is idle. The mine requires heavier machinery, a new shaft and a systematic mode of working.

West Point District.—A lot of ore from a vein near Big Flat, yielded \$40 per ton. The ore resembles granite, although the fissure is large and well defined. The Lone Star mine exhibits one of the most extensive and valuable bodies of pay ore ever seen in this district. The vein at the face of the tunnel, now, is 9 ft. wide and there is still good quartz in sight towards the foot wall. The ore will probably average \$40 per ton. The Zacateno and Bartolo mines, which never yielded less than expenses to say description of economical working for the past 20 years are idle; although both mines have larger quantities of high grade ore exposed in their respective shafts, to-day than ever before. The tunnel of Joe Griggs & Co., intended to drain the water from two veins at the depth of 100 ft. is in 400 ft. 100 ft. further will tap the nearest. These 2 parallel fissures were extensively gouged in early times, yielding large profits. Experienced underground miners are very much needed in this section.

EL DORADO.

St. Lawrence Mine and Mill.—Placerville Democrat, Jan. 25: Last Monday we visited and inspected this mill and mine, situated near Columbia Flat, about 7 miles north of this city. Twenty stamps are kept constantly in motion, crushing about 30 tons per day, the motive power being furnished by an engine of 60-horse power, the working of which causes not the slightest jar or tremor in the engine room. The motive power of the hoisting works is furnished by a smaller engine, another beauty, that runs like clockwork. Under the same roof with the hoisting works is the blacksmith shop, and a creditable innovation and great convenience in the shape of a complete sawmill, with circular saw, logway, carriage, etc., for sawing into shafting lumber, timber, etc., the logs which lie on the natural incline just above. The shaft follows the ledge, pitching east at an angle of about 22½ degrees more or less. Passing the 3 upper levels, one at a 115 ft., one at 200 ft., one at 300 ft. from the surface; our first stoppage was at the 400-ft. level. Here we found a drift running north about 130 ft., along a ledge that at this point is fully 6 ft. thick, beautifully ribboned, with a rich sprinkling of free gold throughout its entire extent. Thence we again descended the shaft, which is being sunk by contract and had, at the time of our visit, reached a depth of 32 ft. below the 400-ft. level, and is being sunk at the rate of about 1½ ft. per day. At this point the ledge has widened to nearly 8 ft., with walls, as above, as smooth as glass, and a splendid gouge over a ft. wide, an unmistakable improvement in the quartz, and the foot wall dropping away until its descent was almost vertical. At the surface the quartz yielded hardly more than \$8 per ton as an average; down to the 200 ft. level not more than \$12 to \$15 per ton; now it is averaging very nearly, if not quite, \$30 per ton, and they are working everything from wall to wall.

NEVADA COUTY.

RICH BOULDER.—Nevada Transcript, Jan. 23: It was reported from North San Juan, that on the Ridge, a boulder of gold weighing over 240 pounds, and worth \$50,000, was found in the claims of Yo Yen & Co., at Moore's Flat, on Tuesday afternoon last. These claims were bought by a Chinese Co. who are engaged in running a deep tunnel and employ about 20 men. The claims always paid well and are known as the old Dowling claims.

DABS OF GOLD.—Grass Valley Union, Jan. 28: The Idaho made a 4-days run of the mill, with 35 stamps, last week, and cleaned up about \$20,000. That gives for 10 days \$42,000 without counting sulphurets.

EUREKA for 6 days, with 10 stamps running, gives \$10,500.

DAISY HILL had crushed last week, 69 tons of rock which yielded \$2,898, or \$42 to the ton. The ore in the mine has steadily increased in value for the last week.

SLATE LEDGE MINE (Perrins's) has cleaned from plates, after five days run, about \$2,000. The batteries were not touched in the clean up.

PLACER COUNTY.

OUR MINES.—Cor. Placer Herald, Jan. 25: The town of Gold Run has a neat, well-to-do appearance, and a population of from 600 to 700. A short ramble in a westerly direction and on a line of the numerous ditches gives you a fine view of hydraulic mining. From the stand point which I fortunately chose, the claims of the "Home Ticket," "Gold Run," "Harriman & Taylor," "Union," and "Pacific" were

spread out to view, in which I counted, I think, about a dozen huge streams of water playing upon the banks. The Mallory cement mill is engaged in crushing blue gravel, which, I am told, is paying a handsome profit to its owners. The "Home Ticket Claims," were using 2 streams of about 500 inches of water against the bank. This claim is one of many owned by the Cedar Creek Gold Mines and Water Co. A little to the south lie the "Gold Run Claims," using 2 streams of about 740 inches of water. About a mile below the Miner's Ditch Co. are running a bed-rock tunnel through very hard rim rock (trap rock) by the aid of an improved drill, costing in the neighborhood of \$800. Between the towns of Gold Run and Dutch Flat lie the "Pacific Claims." Immediately adjoining the "Pacific" are the "Union Claims." These claims are nearly exhausted on the upper stoping. Approaching Dutch Flat, you may glance at the "Central Claims" lying just below the depot. These claims are now being opened, but are not yet in working order. The "Big" and "Little Pine Tops," adjoining the "Central," are finely fitted up for a winter's campaign, but have not yet made a fair start. The "Jehoshaphat" has nearly completed a "run." The "Enterprise" and "Deep Shaft" have nearly completed their opening runs. The shaft 87 feet in depth has been sunk in these claims, and drifts are now being run east and west to test their richness of the lower strata of gravel.

COON.—Placer Argus, Jan. 25: This is a new ledge recently located on Bald Hill near the Green. A shaft has been sunk about 40 ft., the rock from which paid about \$800. A north drift is being run with rock looking fine.

CHATER HILL.—This mine is being worked by the St. Patrick Co.; they have completed the erection of their steam hoisting works and are getting out very rich rock.

RICH STRIKE.—About 10 days ago, two brothers located a quartz ledge near Humburg Flat, in Township No. 2, and commenced working the same. They sunk a shaft about 12 ft., and then started a drift, the second day's work in the drift revealed to their astonished gaze one of the richest pockets that has ever been discovered in this section of the country. They have taken out over \$4,000 in specimens, and the rock now remaining in sight is literally interwoven with gold.

SONOMA COUNTY.

QUICKSILVER.—Cloverdale Bee, Jan. 25: There are two very promising quicksilver mines in this county. They are known as the Cloverdale and the Mount Vernon Quicksilver Mines; are situated 12 miles from this town, and extend from Squaw Creek in an easterly direction, toward the Geysers. A tunnel is being run on the Mount Vernon. On the Cloverdale there is an open cut 30 ft. wide, and about the same extent is excavated in. It is estimated that there is about \$10,000 worth of ore on the dump of the Cloverdale.

TRINITY COUNTY.

NGUET.—Trinity Journal, Jan. 25: Last Saturday a fortunate miner found a nugget of gold on Buckeye mountain, which weighed 3½ lbs. avoirdupois. Buckeye Mountain, so called, is a dry gravel ridge, lying between Rush Creek and Stuart Fork, and below the line of the projected Stuart Fork Ditch. Several large pieces have been found on Buckeye before, one weighing nearly 10 lbs.

THE WAY TO MINE.—We are informed that last week Mr. Jos. McGillivray stripped 6,000 ft. of bed-rock in his mining claim. This was done with a small-sized patent nozzle. We believe it is his intention to use a much larger sized nozzle hereafter, and he expects thereby to strip twice the bed-rock in the same time.

TUOLUMNE COUNTY.

KINCAD TUNNEL.—Sonoma Independent, Jan. 25: This experimental enterprise, draining the deep sinks of the placer mines in the boulder deep of the country, struck through to their shaft on the 17th inst., after tunneling 5 years, 1 month and 3 weeks, without intermission—working 3 shifts night and day.

A Co. of energetic capitalists who styled themselves the Kincad Flat Mining Co., conceived the idea that to drain the Flat by tunneling would be a paying enterprise, and forthwith set about it. From the commencement until the completion of the work, they have blasted in hard lime, flint and slate rock, and no timber was needed. This makes a splendid safe tunnel—being 5 ft. in the bottom, 6 or 7, and 8 ft. in the widest places. The lineal length of the tunnel is 1,762 ft., and the depth of the shaft driven for and reached is 82 ft. There is 50 ft. of gravel and clay on one side of the shaft, but this is not by any means the deepest gravel, as they have found it to the depth of the shaft itself, and no bottom to the gravel has as yet been found.

YUBA COUNTY.

PITTSBURG.—Cor. Marysville Appeal from Sucker Flat, Jan. 29: This mine formerly paid extremely rich and has much valuable ground left. It lies in a narrow, low part of the channel, a large part of which was worked out by the first tunnel. It is now lying idle, and has been for some time. A new tunnel, much lower than the first, has been nearly completed, but that is also idle now.

BLUE GRAVEL.—This claim is quite large, the former owners believing it contained untold wealth, and time has proved their theories correct. They commenced their first tunnel in 1855, finishing on Christmas, 1862. It was 1,200 ft. long, and it was supposed that it would drain the channel of the claim, which was 1,000 ft. front. In this they were mistaken,

as evidenced by their running a lower and deeper tunnel some years later. The Co. became very poor before completing their work. Pierce now a millionaire, kept the boarding-house; McGanney, now rich, wheeled his barrow, and delved with the laborers in the tunnel. At last the tunnel was finished, and a washing or "run" obtained, realizing \$60,000, and the value of this claim was assured. Since then the Co. has divided \$1,570,000, and a portion of this claim was offered for \$40 a share but a few weeks previous. There can be no reasonable doubt but the gross earnings of the claim will amount to \$25,000,000 or \$30,000,000. The work will last for 3 years longer, leaving its owners all millionaires.

BLICK POINT.—This Co. started their tunnel in 1867; it is 2,270 ft. long, 7 ft. wide and 8 ft. high, with a forty-two inch flume, costing \$166,000. This claim has 1,000 ft. front, runs back 500 ft., lying square on the channel; has paid in dividends of \$200,000, and will last much longer, at least 2 years.

Nevada.

ELY DISTRICT.

SILVER PEAK.—Pioche Record, January 18: The ore in this mine is now down 170 ft. The indications are flattering. A stratum of very rich ore has been reached at the bottom of the incline. A rich pocket may have been struck. The dip of the ledge is now about 70 degrees.

PIOCHE.—We were shown the resulting bar of a test working of 14 tons of ore from this mine by the test process. The following is the result: Silver, 887.90 ozs.; total value, \$1,044.61, of which \$27.53 is returned as gold. Another bar produced during the test is worth \$1,214.61. First-class ore continues to be brought to the surface at the rate of 5 tons per day, on which the Magnet mill is constantly crushing. Six assays, embracing all the different classes of Pioche mine ores, are given as follows: 1st, \$675.44; 2d, \$2,104.29; 3d, \$1,626.42; 4th, \$1,600.14; 5th, \$2,199.5th, (car samples) 172.00.

HUNN & HUNN.—The new hoisting works will be in operation the present week, they are of first-class character, and the mine is fully and efficiently opened, with good bodies of ore exposed.

MAZEPPA.—Drifting on the 160-ft. level continues, with ore its entire length. About 30 tons of fine ore have been raised during the past week. This mine is very promising. It is estimated that the ore on the dump will work \$200 per ton if not more. It is a rich chloride in character, and yields assays as high as \$3,000 to the ton.

MEADOW VALLEY.—The shipments of ore to the mill are again made with former regularity. The ores are unchanged in quality and extent.

GRAND TUNNEL.—A shaft is now down 120 ft. below the level of the tunnel, and a drift has been run from the shaft on the vein 180 ft. The ledge proper has an average width of about 3 ft.; 113 tons of ore from this mine, worked last month, returned something over \$200 to the ton.

PROCK PRINCE.—Fine ore is being hoisted, and the mine is very promising. The new shaft is now down 130 ft., and a contract has been made to sink 300 ft. deeper. Contractors are making 3 ft. every 24 hours.

CHIEF OF THE HILL.—This mine continues to give the best of evidence of its value in its steadily increasing bullion shipments. The amount produced and shipped during the week was unusually large. The ore breasts are unchanged.

MAKIN.—Drifting the main shaft, which is now down 230 ft. The ledge is well defined from top to bottom, and is fully 3 ft. wide. The indications are very flattering.

CHIEF EAST EXTENSION.—The main shaft is being sunk below the 90-ft. level. The ledge is well defined. Ledge matter from 2 to 3 ft. wide, with some good ore through it.

NEWARK.—Commenced shipping ore to the Flag mill for reduction last Friday.

KINSTON.—The main shaft is now down and substantially timbered 25 ft. Drifting for the ledge night and day. The drift is only in about 25 ft. at this writing.

ORIENT.—The shaft is now over 100 ft. deep. Very little change in the character of the rock.

ISOMA.—Drifting for the ledge is continued with all energy, 3 shifts being engaged.

BULLION.—W. F. & Co. shipped \$90,887.52 in bullion during the week, against \$84,674.93 last week.

WASHOE.

SUTTERLY.—Gold Hill News, Jan. 22: We were shown last evening a certificate of an assay of float rock from the newly discovered quartz deposits east of Virginia. The largest assay shows \$9,373.22 per ton, nearly all gold in fact, there is not much more than a trace of silver in the ore. It is said that on the claim there is not less than 2,000 tons of float in sight. We were also shown two assays from an extension of the Sutterly. One showed \$197.15 and the other \$78.35 per ton. On this claim they have a lead, but on the Sutterly the lead has not yet been found; in fact, they have not looked for it, as they say they have plenty of ore on the surface.

GOLDEN EAGLE MINING CO.—This Co. own the location spoken of in our issue a day or two since, in the foothills 14 miles east of Virginia. At the meeting a number of specimens of rich ore from the mine were exhibited, along with some 15 or 20 assays from different offices in Gold Hill and Virginia, ranging in value from \$20 to \$300 per ton.

BELOHER.—Jan. 25: Daily yield 300 tons from the 1000 and 1100-ft. levels, added by quite a contribution from the 1200 during this week, hoisting through the winze 200 ft. south of the Crown Point line. The 1200-ft. level is opening out as finely as could well be wished. The ore body is found to extend further south than in the level above, a very encouraging circumstance for the Seg. Belcher, and the ore generally at that level averages fully as good as in any of the levels above. The main incline is down 45 ft. below the 1200-ft. level, the bottom being in hard blasting rock, perfectly dry. The drift east at the 1000-ft. level is in 318 ft. and has about 50 ft. farther to go to reach the ore streak. The drift north at the 850-ft. level is in 432 ft.

OLIVER.—The new cross-cut from the main north drift on the 400-ft. level of the new shaft is in 30 ft., passing almost the entire distance through low grade ore. Mixed with the low grade ore is occasional spots and streaks of rich ore, but taken as a body it is doubtful whether the ore will pay for crushing. The main drift south on this level has cut a fine body of almost barren quartz.

CHOLLAR-PORT.—Daily yield 115 tons, the assay value of which is \$32 per ton. The ore breasts in the different portions of the mine are looking and yielding well as usual. The prospecting drifts at the 750-ft. level and the north drift from the 950-ft. station are driven steadily ahead.

CROWN POINT.—Daily yield about 400 tons. The mine is looking well at all points, but especially at the 1300-ft. level, which is turning out better than any of the levels above. The ore is being extensively and systematically breasted out to the extent of 200 ft. or more along the main drift. At the south end it is worked to within about 10 ft. of the Belcher line. The ore is of extra richness at that point and the body large. The cross-cut east, through the ore body is in 128 ft. with the face in low grade ore and porphyry, and no sign of any east wall. The main incline is down to the 1400-ft. level, with little or no trouble from water and the station for the new lower level will soon be opened.

GOULD & CURRY.—The incline is down 130 ft. below the 1500-ft. level, making excellent progress, though

the rock continues hard blasting. Last Monday a heavy body of water was tapped by the main east drift on the 1500-ft. level, driving the men from the drift and stopping all work in that part of the mine for the present. The main south drift on the 1600-ft. level, to connect with the north drift from the Savage, is being pushed with all the vigor possible.

HALK & NONCHOS.—Daily yield 150 tons of good milling ore. The ore breasts on the different levels of the mine are looking and yielding well. The construction of the ore and waste shafts at the mouth of the main ore body, on the 1700-ft. level, is about completed. A drift north has been commenced on this level to connect with the north winze from the 1,500-ft. level. Sinking the north ore engine winze from the 1,500 to the 1,700-ft. levels is making excellent progress.

KENTUCK.—The old workings between the 400 and 600-ft. levels still continue to yield considerable good ore, and Superintendent McDonald thinks he can extract 40 or 45 tons a day for several months yet. Prospecting will be resumed at the 1,300-ft. level soon.

SAVAGE.—Sinking the incline is making excellent progress, the ground working well. The main drift south on the 1,600-ft. level is pushed steadily and vigorously ahead. The main north drift on the 1,600-ft. level, to connect with the south drift from the Gould & Curry, is making excellent progress, the ground working well, with a considerable increase of water in the face.

VIRGINIA CON.—The shaft is down 148 ft. below the 500-ft. level in good working ground, the sinking making excellent progress. The main north drift on the 1,107-ft. level, from the Gould and Curry shaft, is making good headway, the rock in the face working well. **ARIZONA AND UTAH.**—Drifting east at the 1,500-ft. level from the incline progressing as last week, in hard dry blasting rock. The drift east at the 1,400-ft. level is still running in favorable ledge matter with no sign of the east wall. The water tapped by this drift is nearly all drained out leaving almost none to contend with. Drifting and cross-cutting at the 1,300-ft. level, north going forward as usual.

ARIZONA AND UTAH.—No work has been done in the shaft during the week, on account of the body of water tapped last week. The drift from the 210-ft. level to connect with the Globe tunnel is being pushed with all the vigor possible. The drift from the Globe tunnel to connect with the one from the shaft is also making excellent progress.

ARIZONA.—This claim is situated in Silver City District, a little to the northeast of the Suncor, and some distance to the east of the Comstock ledge. It was worked from 1860 to 1864, the ore being mostly crushed in the Eureka mill, and paying from \$20 to \$60 to the ton. In 1864 the work was stopped on account of the great body of water tapped, which nearly filled the mine. A tunnel has been commenced lower down the hill, which will cut the ledge 100 ft. below the old works. This tunnel is now in about 60 ft., and will have about 100 ft. more to run.

BALTIMORE CON.—The main west drift is thoroughly retimbered and in good working condition to the face, which is about 10 ft. into the clay wall, cutting occasionally bunches and strings of quartz, with strong indications of a near approach to the main ledge.

BEAVER.—Daily yield for the week 54 tons of good milling ore, showing an increase in the yield of about 24 tons per day. The ore breasts on the different levels never were looking and yielding better than at present. The Sherman and Hope mills are kept steadily running on ore from the mine.

INSURANCE.—The incline is down 115 ft. below the tunnel level, and the sinking is stopped for the present on account of the steady increase of water in the shaft. A cross-cut west has been started at this point to reach the west wall.

JULIA.—Opening a new station at the 1000-ft. level is making rapid progress. The main east drift on the 800-ft. level is still driven ahead with better indications of a permanent ore body.

MAKIN.—The ore from the bottom of the shaft continues to exhibit the same extraordinary richness, but appears to carry a much greater proportion of silver than it did near the surface.

PICTURE.—Excellent progress made in sinking the incline. Formation and indications much improved. The lower tunnel is about being reopened and carried through to the ledge, which it will cut at a depth of 500 ft. from the surface.

SILVER NEVADA.—Daily yield, 55 tons of good milling ore, except the mill steadily running. The ore breasts in the upper and middle portions of the mine are looking and yielding well as usual.

SILVER HILL.—Sinking the shaft is making good progress, the bottom still in streaks of quartz and ore mixed with porphyry. The timber for the new station on the 255 ft. level are in, and the station nearly ready to commence the work of drifting. The main drift north at the first station during the week developed some fine ore, giving strong indications of a near approach to the rich chimney found on the level above in the old works. The ore in the face of the main south drift at the first station shows a decided improvement.

SUCCESS.—The new shaft at the foot of the hill, near the mill is down 90 ft., and a drift started eastward to reach the body of ore known to exist below the old workings of the incline on the hill. The new shaft on the east side of the hill is down 250 ft.

SURRO TUNNEL.—In about 3,520 ft. Good progress made in both tunnel and shafts.

WOONVILLE.—Incline down to the second level, which is opened, the drift being in 11 ft. and just about cutting the ledge.

Utah.

TINTIC DISTRICT.

COR. Salt Lake Tribune, Jan. 20: Mammoth Copperopolis is continually shipping large quantities of ore to Europe, the excellent quality of the ore from the mine being opened, the ore from which assays encouragingly.

TINTIC MILL and Mining Company is raising good milling ore from their Diamond ledge.

LUCKY.—A rich vein of ore has again been struck in this mine.

UTAH WINNER.—Salt Lake Mining Journal, Jan. 24: Among the promising mines in Little Cottonwood is the group composed of the Savage, Montezuma, Haverth, and East Chance, and owned by the Utah Winner Silver Mining Co. A large amount of work has been placed upon their mines and their development is rapidly approaching a point where large quantities of rich ore can be taken out daily by a few men at a small cost. A tunnel is being pushed low down the hill which will strike and connect all the veins in all four of the mines, and by which a vast amount of ore can be taken out with the greatest ease. Heavy strikes of rich ore have been made, and everything looks brilliant.

LION HILL GROUP.—Salt Lake Tribune, Jan. 25: ZELLA. Work upon this mine goes steadily on. The new shaft connection with the Senate Chamber will soon be ready for use, also the drift connection with the Silver Chief shaft, will soon be finished.

MOUNTAIN.—In the new shaft being sunk upon this mine, some very fine ore has been reached, but so far not in very large quantities.

CHLORIDE GROUP.—None of the mines of this group are at work, except the San Joaquin. From this some fine ore is being taken, but none being sent away for reduction.

SILVER SHIELD and McCOLLUM GROUPS.—No ore is being taken from any of the mines of these two groups and no prospecting is going on except in the Miners' Delight of the Silver Shield group and the Grey Rock of the McCollum group.

CHICAGO.—About 8 men are employed upon the works of this mine. The ore is extracted and piled away in the ore house, ready for shipment on the opening of spring.

Chemistry in Great Fires.*

The rapidity with which the great conflagration in Boston destroyed millions of dollars' worth of property, and set at defiance the most energetic efforts, combined with the most powerful mechanical appliances, invite an inquiry into the *modus operandi* of heat in such circumstances. An estimate of the heat evolved would probably show how weak is man, with all his combinations before such force. We might as well propose to extinguish Vesuvius, or arrest the outburst of an eruption of Mauna Loa. The phenomena show that greater heat force was engaged than is commonly involved in the simple combustion of ordinary fuel—or, in other words, the ordinary flame-heat of burning lumber would not have destroyed the materials presented to it in the Boston fire with such astonishing rapidity.

New Sources of Heat

Extraordinarily accumulated in the area of that conflagration must have been created. It may appear, also, that the very elements employed to extinguish the fire, under the peculiar circumstances of the case, were turned to the side of the enemy against those accustomed to confide in its usually all-sufficient efficacy. We venture to propose these things, because if found true, their appreciation must lead to new expedients in the future to suppress conflagrations.

First, by way of illustration: If by some Titan power the Falls of Niagara should be precipitated into the crater of Mauna Loa in a state of eruption, what would become of the water? Would it put the fire out? No. Would it not become an additional combustion to immensely increase the light and heat? In such an enormous cauldron of fire, or plutonic furnace, the water, before it could act as water to extinguish the fire, would be converted into steam or vapor and ascend. In ordinary fires we see this in the white vapor which arises as soon as the water is poured on the flames, and when only a part of the water projected arrives upon the burning materials. Fortunately, this fraction of the water, the other part being lost, usually suffices. But it is probable that in our volcano the whole of the water would be lost, and Niagara would become an auxiliary of no mean potency to the internal caloric below. To this end, however, something more is required than the mere conversion of the water into ascending steam, driven out and pursued by the flames. Even as superheated steam it would be expelled all the faster. Its sudden expansion in our crater might damage its walls, and burst the chimney, but that would only extend the area of the fireplace below—not extinguishing the combustion.

The Fuel of Volcanoes

Consists of hydro-carbons, sulphur and water or hydrogen, carbon sulphur and oxygen. An accelerator to the combustion is the hydrogen of the water, liberated from its oxygen and the reunion of it and the free oxygen with the other existing hydrogen and carbon elements. Among these the sulphur in absorbing a portion of hydrogen, may act as an extinguisher. Some volcanoes, which emit usually fire, also at times eject only water, gas and mud. When hydro-carbons in combustion, meet these currents of water, the heat decomposes the steam into its component gases, and then follows greatly-augmented temperature and expansive explosions, and the heat generated is raised in the proportions of an ordinary flame to that of a compound oxygen-hydrogen blow-pipe. The recombination of these gases, viz.: the nascent oxygen and hydrogen of the decomposed steam, with the hydro-carbons furnished from the burning materials, give rise to the instantaneous

Formation of New Combustible Gases,

Whose heat of combustion or caloric power is of a far higher degree than that of the former simple elements. The additional heat-power of carbon oxide gas and carburetted hydrogen are added to increase the temperature and urge the flames. These producers of intense light and heat are attributable to and derived from the water.

Secondly—If now we have our volcanic illustration, and apply these views to the Boston fire, we may discover a similar state of things. The conditions of the Boston fire were extraordinary, and so peculiar to that conflagration that it may never or should never occur again.

The Boston Fire

Is a near illustration of a great volcano, though only as a feud artifice resembles those vast natural combustions in Nature's chemical laboratory. In a comparatively narrow area, ventilated by small and winding streets, were closely accumulated lofty walls of rock, intersected everywhere with large caverns, piled above each other four or five stories high. These spaces among the walls were well stored and packed with hydro-carbons in their most concentrated forms, even as the cavities in Blossom Rock were crammed with barrels of gunpowder. In the Boston volcano on the intersecting partitions of the magazine were also hydro-carbons in wood form. The contents were chiefly cotton, silk, and wool, or the dry goods which filled the stores. All these are concentrated hydro-carbons. Besides these were accumulations of oils, spirits and other vegetable and animal hydrocarbons. We leave to others to calculate the expansive force of a

bale of these goods tightly packed, when by the sudden addition of great heat, it is promptly converted into burning gas, and to multiply the sum of that calculation by the number of bales, when the fire was once fairly started and they became involved in a heat of from 3,000 to 4,000 degrees Fahrenheit, they could not wait upon the slow combustion of ordinary flame, but were promptly converted into incandescent heat, and transformed into their expanded gaseous elements, which as promptly united with the gaseous elements of steam. We have now their combined power bursting, splitting, and calcining walls; consuming and incinerating lumber, far faster than ordinary flame-heat—melting and vaporizing metals in an instant—and even as quickly recombining the carbon smoke into carburetted hydrogen, and forcing that same smoke to return to destructive force. From the atmospheric air drawn through the streets and stories the oxygen would be quickly abstracted; while the nitrogen and carbonic acid gas of the air, though really extinguishers, when superheated to two or three thousand degrees, become incendiary agents to communicate fire and consume what they touch. We know of no other explanation to offer for the astonishing rapidity with which the Boston fire accomplished its work of destruction.

Precaution Proposed.

Immediately after this great fire the architects of San Francisco with commendable zeal assembled to inquire why the fire-proof buildings so suddenly wilted, and to devise new methods for the future. If the above views are correct they will perceive how vain is their assiduity. As a first remedy, broad streets and low buildings might be suggested. The storage of the bulk of goods in special warehouses, and their sale by samples from smaller stores; but this question may fairly be left to architects, and to merchants who pay \$5,000 per front foot for land. The suggestions of a chemical nature may possibly serve the municipal authorities and the fire and water departments.

Though fresh water under, the above conditions, supplies the combustible fuels, we find in salt water a counteracting agent. If salt water contains oxygen and hydrogen, it also yields from its murate of soda a large amount of chlorine. This chlorine nascent at the moment of the decomposition of the steam, would enter the most positive extinguisher by intercepting as a formation of combustible gases. To salt water, then, reference may be had for important aid.

If great fires were more frequent, and the subject "would pay," a chlorine company might be formed in conjunction with the Fire Department, conducting its chlorine into every building, and by chlorination extinguish fires, and otherwise enliven unhealthy places.

*Read before the California Academy of sciences by Dr. A. B. Stout.

A New Magnetic Toy.

A novel and peculiar magnetic toy or game, which Roman & Co. have for sale, is something that would rather surprise the casual observer with its seeming intelligence in answering questions propounded to it. It may be used for amusement or instruction and is intended more particularly for children or scholars who are studying elementary school books, and serves as an aid or teacher. There is a flat box divided by a glass partition and under the glass is a small magnetic needle arranged to move freely, and to it is attached a non-magnetic finger or indicator. The glass is covered with paper, with the exception of a portion which shows the extremity of the needle. A circular card is placed around the outer edge of the box on the glass on which are printed or written answers to questions; a small circular card is placed in the center upon which are printed or written questions to correspond with the answers on the outer card. The small card is made of two thicknesses of paper between which is a small magnet.

The loadstone suspended magnet being positively electrified, will then cause the finger or indicator to follow the negatively electrified end of the magnetized piece of steel in the small card containing the questions. The arrangement of the answers around the exposed portion of the glass is such that when the subdivision in which the question occurs on the central card, is placed to correspond with the mark at the north point of the negative end of the magnetized steel, will cause the finger to point to the answer on the outer row. By using a number of questions and answer cards, the device can be made use of quite extensively as an instructor for children and will also afford amusement and instruction for older persons. This toy, which was recently patented through our agency, by Jacob Unna, is called the "Chromagica," and, as furnished by Roman & Co., is very neatly prepared. The questions are in the main sensible ones, and parents or teachers using it could, of course, prepare cards for themselves to suit the age of the children. It is one of those toys seldom met with, which is amusing, and at the same time instructive.

CLEAN UP.—The last clean up of the Virtue mill, Oregon, was \$12,600 or \$240 per day. The mill has ten stamps and the mine belongs to the Virtue Mining Company.

The First Quartz Mill in California.

In our issue of January 4th we gave two wood cuts representing the mill and stamps of the Keystone Mill, in Amador county. In the article accompanying the cuts we said that there was considerable difference of opinion with regard to the locality of the first quartz mill ever built in California, but we were assured that the one represented in the illustrations, was really the first mill built here. We gave no dates, as we were unable to get them from reliable sources, and preferred to leave the question open for some of our interior contemporaries to answer. As several localities claimed the honor, we wished to obtain the dates, etc., for the benefit of readers of the Press. Our excellent and well managed exchange, the *Mariposa Gazette*, proposes to put in a claim for Mariposa county, and gives facts and dates which it thinks will establish the priority of that county, in the matter of quartz mills as well as quartz mines. It says:

The first quartz mill, including a small steam engine and machinery, was brought to Mariposa in 1849, for Col. Fremont, by James Duff, who is now a resident of this town. He started with it, from the East, in April of that year. The mill was put up on Mariposa creek, near the lower end of the present town, in the month of August, 1849, and was operated by Palmer, Cook & Co. for Fremont, and was known as the Palmer, Cook & Co. mill.

In June, 1850, the machinery for another mill was brought here for Commodore Stockton, and put up on Stockton creek, about a mile from the town of Mariposa. J. R. Norris, an old Mariposian, now a resident of the Salinas valley, was the agent and business manager for Stockton, and John Barnett, who died here last spring, was Superintendent of the mine.

The third quartz mill erected in Mariposa was brought out by Capt. Howard, of the U. S. Navy, early in 1850. It was located below the present site of the town, near the spot now occupied by the Mariposa Company's mill. It was known as the Fremont mill.

J. F. Johnson (known familiarly as "quartz Johnson"), put up two quartz mills during the year 1850—one, a horse-power mill, at Bear valley, and the other, a steam power, at what was known as Ridley's Ferry, on, or near the site of the Beuton mills.

The first regularly organized and incorporated quartz mining company in the State of California was the Merced Mining Company. Among its stockholders were Smythe Clarke, Moffat (the assayer), T. Butler King, J. F. Johnson, and Dr. Temple of St. Louis.

We have given our dates, and if any county in the State can prove up an earlier experience in quartz mining than Mariposa, we will be pleased to see their figures and publish the fact.

HANDSOME ALBUMS.—We saw recently, at the bindery of Messrs. Bartling & Kimball, corner of Sansome and Clay streets, some remarkably fine specimens of book bindery. The books were made for Watkins, the well-known photographer, and were intended to hold large views of Yosemite and other California photographs. The binding was in gilt and heavy morocco; in the center of each on the outside was a panel of California laurel, brightly polished, making a handsome and peculiar finish. The books are very large, admirably adapted for the purpose and prove that our California binders can do fine and substantial work, equal to any in older countries.

COAL VS. WOOD.—The Belcher and Yellow Jacket companies are now using coal at their hoisting works instead of wood; according to the *Virginia Chronicle*. This is as it should be, as the railroad find it impossible at present to furnish all the mills and hoisting works with wood.

SMELTING IN ARIZONA.—Baker's smelting furnaces, in Wallapai District, Arizona, after repeated failures are now reported to be working successfully, and are now turning out 40 tons a day. The trouble has been in getting proper fluxes for the ores.

TRANSIT OF VENUS.—A convention of the astronomers designated by France, Germany, England and Russia, to observe the Transit of Venus in 1874, will meet at Paris in February to determine the exact points of observations.

A NOVEL IDEA.—The motive power of the griet mill at Prairie City, Grant County, Oregon, is water from a hot spring, which prevents any fear of stoppage from a freeze-up in cold weather.

ELY DISTRICT MINES.—During the year which has just passed, 349 mining claims were located in Ely District; a large number for such a short space of time.

MINERAL HILL MINES.—The sum of \$590,448 was shipped from Mineral Hill by Wells Fargo & Co. during 1872.

The Floral Mill.

This is one of the most important enterprises in Ely District, says the *Pioche Record*, and is located in the lower part of Pioche, so that it may be reached by teams from all the mines without any heavy pulling, being a nice down grade all the way. The Floral is designed as a custom mill, the necessity for which has long been felt by the mining population here. Many men of limited means and possessing mines of great value, have been compelled to abandon them, not being able to have their rock crushed without incurring the expense of hauling a great distance, thus leaving them without sufficient remuneration for their labor. With the completion of the Floral mill, however, which is easy of access, an opportunity is afforded every one having a good claim to have his ore crushed on such terms as to make it profitable to the miner of moderate means, and thus benefit the whole camp by the crushing of a vast amount of rock which otherwise would not be crushed at all. As the mill is so near completion as to admit of a fair view of it, and all the machinery being on the ground, we yesterday visited it, and Mr. J. C. Clark, the superintendent, courteously showed us through the whole establishment, and explained the entire machinery, showing what had been done and what was contemplated. The main building is 42x60 feet in dimensions; the engine room 30x69. The machinery is all of the latest patent and highest finish, and was made at the Risdon Iron and Locomotive Works, San Francisco. (This is the first machinery in the camp from the Risdon Works.) The stone foundation is a master piece of workmanship, as firm and durable as mason work can be made, and destined to stand till the youngest child of this day is bowed down with declining years. The wood work is durable, also, being bound together with heavy iron rods and securely braced throughout, dispensing with the usual stanchions which are so much in the way of operatives in other mills. This mill has 20 stamps, with two boilers, 48x16 each; fly-wheel 14 feet in diameter; engine 90-horse power; and also Blake's adjustable cut-off and governor, designed to prevent accidents, for in the event of a belt breaking the engine stops without human aid. Attached to the mill is a retort room, dry kiln, chemical room, office, blacksmith shop and boarding house, and an assay office will soon be added. On the ground are 500 cords of wood and a water tank of 14,000 gallons capacity, and another tank to be built, so as to have no less than 30,000 at command all the time. The crushing capacity of the mill is 25 tons a day. Mr. Clark proposes attaching a heavy hose to the main pipe of Floral Spring Water Company, so that in case of fire the means of its extinguishment may always be at command. The work was commenced on the 2d of September last, and by the 15th or 20th of next month the ears of our people will be greeted by the shrill whistle of the Floral Mill. The whole cost of the mill is about \$60,000. It bids fair to be a profitable investment of capital, and will confer untold benefit upon the mining interest. The large scales of the company, with a capacity for weighing 40,000 pounds, will be erected near Boone & Dolman's hay yard, for the use of the company and such others as wish to avail themselves of its advantages.

Arizona Mines.

The *Arizona Miner*, in an article entitled "Mines and Mining," says: Under this head is concentrated the hopes and expectations of two-thirds of the population of the Territory and our review of the situation is not as satisfactory as could be wished. Indians and dry weather having prevented operations on some of the most promising mines.

The number of distinct, different quartz veins or lodes discovered and located in the Territory is carefully estimated at more than 2,000. On a large number of them sufficient work has been done to warrant the belief that they are fissure veins and will develop into valuable mines.

The greater portion have never been opened sufficiently to enable one to consider them anything more than promising surface indications. Many of the discoverers have been killed by Indians. Others have become discouraged and left the Territory, and hundreds of good looking veins which prospect well in silver and gold will, under the present U. S. law, requiring ten dollars worth of work on each 100 feet in length on each mineral vein, be forfeited and subject to re-location after the 12th day of May next.

There are fifteen quartz mills in Arizona, of from two to forty stamps, and the amount of silver and gold bullion turned out last year is estimated at about \$1,000,000.

There is more activity in quartz mining in Mohave county at present than in any other portion of the Territory, with better prospects of success than elsewhere, as the latter Indians are quiet and assist the miners by their labor, instead of retarding their operations by hostility.

Owing to the absence of water in the streams, but little has been realized from placer mines for three years past. A wet winter would add from \$300,000 to \$400,000, from this source, to our annual yield of precious metals.

USEFUL INFORMATION.

New Mode of Manufacturing Lamp-black.

A few years ago, a party of gentlemen started what they intended to be an oil well, near Cumberland, Md. They soon, however, were disappointed in their expectation, for instead of striking oil, they came upon a gas chamber. A short time afterwards, the emitting gas was accidentally set on fire, and continued to burn for a period of two years. About a year ago, according to the *Manufacturer and Builder*, Mr. Haworth, a gentleman from Boston, having heard of the burning well, went to Cumberland, tested the quality of the gas, and was satisfied that he could put into operation a scheme or plan of his own for the manufacture of carbon (lamp-black) from the gas. Accordingly, the well was leased or purchased, and a patent obtained for the manufacture, according to the plan of Mr. Haworth. A building was constructed, and the manufacture commenced about six months ago.

There are now in operation six hundred and sixty burners, each burner consuming eight cubic feet per hour. The gas is allowed to burn against soapstone plates, on which the carbon is deposited in the form of soot. By a very neat mechanical arrangement, the soot is scraped off and deposited in large tin boxes about three feet long, and a foot and a half wide, and a foot and a half deep; scrapers are passed along the soapstone plates every twenty minutes, and the boxes are filled on their fourth passage. A large building is now in course of construction, twice the size of the present one, and will have in use thirteen hundred and twenty-eight feet gas burners. The present composition of gas amounts to about one-twelfth of the whole quantity escaping from this well. When the new building is completed and the burners put in operation, the total consumption of gas, by this burners of both buildings, will be one-fourth of the whole.

The carbon is used for the manufacture of ink, and these works, we believe, are the only ones of the kind in the country; and as far as the knowledge of this owners extend, they are the only ones of the kind in the world.

As we have struck burning gas wells in this State, would it not be well for the owners thereof to consider the feasibility of utilizing them in the manner above described?

LAUGHING PLANT.—A singular vegetable phenomenon has been discovered during recent explorations in Arabia. It is called the laughing plant, from the effect which is produced by the seeds. When they are pulverized and then eaten in small quantities, the person eating them will soon begin to laugh loudly, then to sing, dance, and do all manner of absurd things. This lasts for about an hour, after which he goes to sleep, and having slept another hour wakes up utterly unconscious of what has occurred. It has been suggested that this plant might be made a substitute for alcohol, and that it would have the advantage of being cheaper. But it is scarcely probable that the Arabian plant could in fact be made popular in that capacity, for it does not appear that it inspires the person who partakes of it with a desire to whip his wife, murder his mother, or to indulge in any of the little pleasantries that the alcohol of the period moves one to perpetrate.

RAPIDITY OF MUSCULAR CONTRACTION.—A dragon-fly, balanced on its wings at the side of a car speeding its way over the rails, at the rate of forty miles an hour, appears to be almost motionless, but to keep up with the car, its wings must vibrate many thousand times a second. The eye cannot detect their up and down action, so exceedingly rapid are the contractions and relaxations of the muscles acting upon them. All at once they dart off at a right angle so quickly that the retina cannot have an impression remaining long enough to retrace their course. Therefore, those same muscles, too small to be seen but by powerful microscopic assistance, must be urged to still more rapid action. Such intense activity far exceeds the vibration of musical chords, and therefore exceedingly perplexes entomologists, because the nervous system of insects is so extremely minute. The question is: How much power is generated for keeping a dragon-fly's wings in uninterrupted motion for many hours in succession, without apparent fatigue?

POWER OF THE RIGHT HAND.—In a paper read before the Chirurgical Society of London, Dr. Ogle states it as his belief that the superiority of the right hand, in works requiring strength and skill, is not due merely to custom and usage. His reasons for this opinion are that the superior power of the right side is not confined to the arm, but extends to the leg, and that it commences in the arm before use or education begins, and continues in spite of all efforts to resist or divert it. This superiority has a resemblance to some malformation, inasmuch as it is hereditary and is met with more frequently in the male sex, not only in men, but in apes and parrots. The author further asserts that the left side of a right-handed man is greater than the right, and vice versa, and he suggests that this greater development of the left side is due to the greater quantity of blood which it receives.

Oiling the Harness.

In these times of poor leather, we should clean and oil the harness at least once a year, to keep it in good condition, and to reduce the wear and tear as much as possible. Don't let the job out to the harness maker, but some of these stormy days when this harness is not in use, just take it into the work-shop and commence operations. Take the harness all apart, and scrape off all scurf, hairs and dirt, and wash the leather clean with soap and hot water. Then heat two or three quarts of neatfoot oil in a long shallow pan, and draw each piece of leather through it slowly bending the leather backward and forward, and rubbing the oil in with a cloth or a sponge. Hang near the fire to dry, and repeat the process until the leather is saturated with oil; mix a little lampblack with clean tallow, and with a cloth rub it into the leather while warm, until the pores are filled and the surface becomes smooth and glossy. If a harness is oiled in this way it is never gummy, and will therefore keep clean a long time. Sometimes linseed oil or adulterated oils are used, but they dry on the leather and make it gummy, dirt and hairs stick to it and the harness gets so filthy as to soil every thing it touches. After the harness has had a good oiling, an occasional rubbing with tallow and lampblack will keep the leather tough and pliable, and prevent it from cracking.—*Country Gent.*

PAINTER ZINC.—A difficulty is often experienced in causing oil colors to adhere to sheet zinc. Boettger recommends the employment of a mordant, so to speak, of the following composition: one part of chloride of copper, one of nitrate of copper, and one of sal ammoniac are to be dissolved in sixty-four parts of water; to which solution is to be added one part of commercial hydrochloric acid. The sheets of zinc are to be brushed over with this liquid, which gives them a deep black color; in the course of from twelve to twenty-four hours they become dry, and to their now dirty gray surface a coat of any oil color will firmly adhere. Some sheets of zinc prepared in this way and afterwards painted have been found to entirely withstand all the atmospheric changes of winter and summer.

PERFUME FOR THE HANDKERCHIEF.—A delicious perfume for handkerchiefs, etc., can be made after the following recipe: Procure half a pound oforris powdered; pour over it one pint of rectified spirits; let them stand in a bottle tightly corked for one fortnight; then filter the spirits through blotting paper, and add half a drachm, otto of lavender, one drachm of otto of bergamot, and half an ounce of otto of neroli. Let it stand for twenty-four hours, and then filter through blotting paper to make it very clear. A paper filter is easily made by taking a square piece of blotting paper that will just lay over a pint or quart bowl, fold it twice and from corner to corner. Now open it, and you can pour the liquid in very easily, using a small pitcher to drain it into.

ANTIMONY AN EXPLOSIVE METAL.—If a piece of copper foil be attached to the negative pole of a galvanic battery, and a piece of platinum foil to the positive pole, and the two immersed in a hydrochloric acid solution of antimony, the antimony will be precipitated as a metallic mirror on the surface of the copper. After removing it from the liquid and carefully washing with distilled water, the brittle antimony can be removed by bending the copper back and forth. Antimony thus obtained will explode upon being rubbed in a mortar or struck with a hammer, light and heat as well as detonation being produced by this explosion. The reason of this extraordinary action of only one metal is due to the rapidity with which it returns from the amorphous form to the crystalline.

DOES FROST AFFECT THE STRENGTH OF IRON?—Notwithstanding the generally expressed opinion, and the apparent showing of careful experiments to the contrary of the above query, news of serious railroad accidents, from broken rails, has been pouring in from all parts of the country, since winter frosts became severe. Some of these accidents are appalling in extent and details, and it would seem that it was time, if such accidents do not proceed from the deteriorating action of frost, to consider some radical change in the structure of rails or track, that would effectually prevent this class of accidents.

REMEDIES FOR BOILER INCORUSTATION are almost innumerable. Among those in common use and lately recommended are soda ash, chloride of barium, carbonate of ammonia, chloride of ammonia, starch, potatoes, molasses, tannin or extract of oak bark, dye-wood extracts, bran, chicory, fate and tar. Mahogany saw-dust and clay are also used, but are objected to as producing injurious affects in the cylinder; and in regard to nearly all the substances above enumerated there is a difference of opinion among practical engineers.

BENZOLE AND BENZINE.—Pitch is readily dissolved by benzole, while it is scarcely at all dissolved by benzine. This, therefore, is the means of distinguishing the one from the other.

TO PREVENT RUST.—It is said that equal parts of carbolic acid and olive oil, smeared over the surface of the instruments, are an unfailing preventive of rust in any climate.

GOOD HEALTH.

Lifting--Its Rationale.

Prof. Welch, of Yale College, is a firm advocate of the benefits of lifting, from a strengthening point of view. He thus sums up its advantages, in the following language:

Lifting is a system of harmonious and simultaneous exercise of the whole body. Every muscle is brought into use at once, and each in proportion to its relative strength. And so connected are the vital organs with the muscular tissues of the body, that when all the muscles simultaneously and harmoniously act, the organs themselves receive their appropriate amount of exercise. So distributed in this effort that there is no danger of injurious strain or rupture. It strengthens the weak organs and expels disease, by a gradual co-operative exercise of the whole body. The strength of the whole is augmented and equalized, the weak parts are built up, disease is expelled, and the individual becomes uniformly strong, and, consequently, healthy. It develops power chiefly at the vital centers. All the voluntary and respiratory muscles are brought into harmonious play, expanding the chest, augmenting the breathing capacity, aerating the blood, equalizing the circulation, warming the extremities, and thus vitalizing every part; and by determining action and circulation to the whole surface, increases the relative amount of blood in the extreme capillary vessels, thereby removing internal congestion wherever located, and accelerating the nutrition of every organ. When these reasons are fully understood, the fact that many persons have, by the simple process of lifting, more than doubled their strength in three months, will not be surprising.

Something About Teeth.

Why, asks *Chambers' Journal*, do some people's teeth come out more readily than others? The reasons for this are probably many. About the middle of last century Peter Kalm, a Swede, visited America, and wrote sensibly about what he saw. He observed a frequent loss of teeth among settlers from Europe, especially women. After discussing and rejecting many modes of explanation, he attributed it to hot tea and other hot beverages; and came to a general conclusion that "hot feeders lose their teeth more rapidly than cold feeders." Mr. Catlin, who some years ago had an interesting exhibition of Indian society, dresses, weapons, etc., noticed that North American Indians have better teeth than the whites. He accounts for the difference in this strange way—that the reds keep the mouth shut, whereas the whites keep it open. The teeth, he says, require moisture to keep their surface in good working order; when the mouth is open, the mucous membrane has a tendency to dry up, the teeth lose their needed supply of moisture, and thence come discoloration, toothache, ticdouloureux, decay, looseness, and eventual loss of teeth. Mr. Catlin scolds the human race generally for being less sensible than the brutes in this respect, and the white race especially in comparison with the red. We keep our mouths open far too much; the Indian warrior sleep, hunts and smiles with his mouth shut, and respires through the nostrils. Among the virtues attributed by him to closed lips, one is excellent—when you are angry, keep your mouth shut.

Health Laconics.

SUNSHINE.—Do not exclude the sunshine to save the carpet. Sunlight is essential to health. Human beings are as dependent upon light as are plants and animals. Children reared in shady rooms have weak eyes, and are as frail and scrofulous as potato vines in a cellar.

COLD FEET.—Never go to bed with cold feet without applying a hot brick, hot bag of sand, a jug of hot water, or some warming material. Cold feet are often caused by tight shoes, stockings, or garters. When the feet are habitually cold, a smart walk or run before retiring, will often make them comfortable for the night.

DYSPEPSIA.—A majority of cases are owing to errors in diet and sedentary habits. Exercise half an hour each morning before breakfast. Eat plentifully of fruit and Graham bread. Avoid greasy dishes, fresh fermented bread, cold cheese, pickles and candies.

PALPITATION.—This is caused by thick blood, or obstruction in the excretory organs. Bathe once a week at least, and keep the bowels free.

IMPURITY OF THE BLOOD.—Never think of making the blood better by putting drugs or poisons into it. Pure water, pure air and pure food are nature's purifiers. Take of these first what the system can use and no more, and your blood will take care of itself—and of you too.

CORNS AND BUNIONS.—Have your boots and shoes made to fit your feet, instead of trying to shape your feet to the hoots and shoes. Then soak the excrescences in warm water occasionally, cut off the softened surface, and in due time they will be seen no more forever.

SLEEP.—Go to bed with warm feet, an empty stomach and unexcited brain. Be sure and keep a clear conscience. Then shall your sleep be dreamless and your days long in the land.

Foolish Habits.

Dr. Hall, in his *Journal of Health*, enumerates several practices of the careless public, which are sometimes as dangerous as they are foolish:

Walking along the streets with the point of an umbrella sticking out behind, under the arm or over the shoulder. By suddenly stopping to speak to a friend, or other cause, a person walking in the rear had his brain penetrated through the eye, in one of our streets, and died in a few days.

To carry a long pencil in vest or outside coat-pocket. Not long since, a clerk in New York fell, and the long cedar pencil so pierced an important artery that it had to be cut down from the top of the shoulder to prevent his bleeding to death, with a three month's illness.

To take exercise, or walk for the health, when every step is a drag, and instinct urges repose.

To guzzle down a glass of cold water, on getting up in the morning, without any feeling of thirst, under the impression of the health-giving nature of its washing-out qualities.

To sit down to a table and "force" yourself to eat, when there is not only no appetite, but a decided aversion to food.

To take a glass of soda, or toddy, or sangaree, or mint-drops, on a summer day, under the belief that it is safer and better than a glass of cold water.

To persuade yourself that you are destroying one unpleasant odor by introducing a stronger one; that is, trying to sweeten your unwashed garments and person by enveloping yourself in the fumes of musk, eau de cologne, or rose-water; the best perfums being a clean skin and well-washed clothing.

How Drinking Causes Apoplexy.

It is the essential nature of all wines and spirits to send an increased amount of blood to the brain. The first effect of taking a glass of wine or stronger form of alcohol, is to send the blood there faster than common, hence the circulation that gives the red face. It increases the activity of the brain, and it works faster, and so does the tongue. But as the blood goes to the brain faster than common, it returns faster, and no special harm results. But suppose a man keeps on drinking, the blood is sent to the brain so fast, in such large quantities, that in order to make room for it the arteries have to enlarge themselves; they increase in size, and in doing so they press against the more yielding flaccid veins which carry the blood out of the brain and thus diminish their size, their pores, the result being that the blood is not only carried to the arteries of the brain faster than is natural or healthful, but it is prevented from leaving it as fast as usual; hence, a don't set of causes of death are in operation. Hence, a man may drink enough of brandy or other spirits in a few hours, or even minutes, to bring on a fatal attack of apoplexy. This is literally being dead drunk.—*Dr. Hall.*

HOW TO GET RID OF MOLES.—Ladies have a horror of those black eminences which sometimes appear on the face, called moles. Even homely men dislike them, but there they ordinarily remain as guides in giving a description of an applicant for a passport.

An exchange says a mole is a thickening of the epidermis, or outer skin, probably induced by an obstruction in the outward ends of a cluster of sweat-tubes. To be clear of them readily, run a fine needle through one of them from one side to the other.

Let an assistant take hold of both ends of the needle and pull so as to make a neck of clear skin at the base. It is neither painful nor difficult, and attended with hardly a tinge of blood. Next ligate that neck behind this out-dragged mole with a delicate, strong, waxed silk thread, that cuts off the circulation; clip away the unused thread and await the result. A slight local inflammation ensues, which is the glueing together the new surface of the stitched skin.

In a few days this old offence drops off, deprived of nutrition, leaving no scar. If a little reddish by the remains of a subduing inflammation, wash the spot occasionally with cold water. Proceed to the next, and the next, seriatim. Before aware of it, any mole-disfigured face may become as good as new.

WHAT IS UNDER THE HOUSE?—One great fault in building houses in both city and country is to make them too low on the ground. There should be distance enough to allow a free circulation of air, say three feet, between the floor and the earth. All rubbish, shavings, etc., should be cleaned away before siding up, and a good ventilation should be kept open to insure dry, sweet air under the floors. Much sickness is caused to many families from low underpinning, and close, damp, stagnant air, carrying miasma into the lower rooms through the floors of dwellings. Many houses are built upon flat ground, and the earth thrown around the outside, making a sink under the house to hold water. This is wrong. It is much better to raise the ground under the house, and even gravel and cement before building. At any rate, ventilation under the house should be always attended to. We do not believe in cellars under the house in this climate, but whenever there is a cellar it should be open, and always kept clean of decaying substances. Guard against the enemies to health that lurk under a house.—*Ex.*

B. EWER..... SENIOR EDITOR.

DEWEY & CO., Publishers.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

Subscriptions payable in advance—For one year, \$4; six months, \$2.50; three months, \$1.25. Clubs of ten names or more, \$3 each per annum. \$5, in advance, will pay for 12 years. Remittance by registered letters or P. O. orders at our risk.

Table of Contents.

GENERAL EDITORIALS.—Movements of the Stars; The Academy of Sciences, 65. The Railroads of the Golden State, 72. The Fear Stone in San Francisco; Railroad Items, 73. **ILLUSTRATIONS.**—Method of Ventilating Mines, 65. Scott's Patent Wheel-Moulding Machine, 73. **CORRESPONDENCE.**—Yuma County Mines, Arizona; Antelope District, Nevada, 66. **MINING SUMMARY** from various counties in California, Nevada and Utah, 68-69. **MINING STOCK MARKET.**—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 68. **SCIENTIFIC PROGRESS.**—Changes in Coal by Exposure; Casein; Determining the Alcoholic Strength of Liquors; Origin of Meteorites; Changes in the Moon; Filliform, Native Silver; Red and White Blood, 67. **MECHANICAL PROGRESS.**—Important Improvement in Fresco Painting; Testing the Quality of Lubricating Oil; Paper Window Shutters; Friction of Journals; Tidal Water Power—A New and Useful Suggestion, 67. **USEFUL INFORMATION.**—New Mode of Manufacturing Lamp-black; Lancing Plant; Rapidity of Molecular Contraction; Power of the Right Hand; Oiling the Harness, 71. **GOOD HEALTH.**—Lifting—Its Rationale; Something About Teeth; Health Laconics; Foolish Habits; How Drinking Causes Apoplexy; How to Get Rid of Moles; What is Under the House? 71. **MISCELLANEOUS.**—Resources of Utah; The Heart of the Mines, 68. Chemistry in Great Fires; A New Magnetite Toy; The First Quartz Mill in California; Handsome Albums; The Floral Mill; Arizona Mines, 70. Laws Under New California Code—Taking Effect Jan. 1, 1873; Virginia and Gold Hill Water Company; Grass Valley Mines, 74.

REDUCTION IN TELEGRAPH RATES.—It has been announced that after the 1st of February, all rates between the different offices of the Western Union Telegraph Company, for ten words that are now more than \$2.50 will be reduced to that price. This is particularly beneficial to parties in this State, as it reduces telegraphing expenses to the East materially. Cheap telegraphy is one of the necessities of the age, and the people care very little who furnishes it as long as they have the benefit.

AN ANCIENT FROG.—While the workmen were engaged in sinking a vertical shaft at the Black Diamond Coal Company's mine in Mount Diablo, recently, they came upon a frog at the depth of 172 feet. It was imbedded in solid sandstone, so that the impression of its form was perfect upon the rock around it, but nevertheless, was alive, and lived for twelve hours after its extraction. The President of the company now has it, and will present it to the Academy of Sciences.

HOME INDUSTRY.—The Mission and Pacific Woolen Mills have added another branch to their business, by undertaking the manufacture of rug and carpets. Their mills have attained such a reputation both at home and abroad by their superior products that there is no doubt but that the carpets will be as good if not better than those made in the East.

JAPANESE PROGRESS.—An industrial fair and exhibition is to be held in the city of Kioto, in Japan, in March, and a number of San Francisco manufacturers are about to forward articles to that place. In view of the increasing trade with the Orient our artisans and manufacturers should take advantage of every opportunity to show their wares, and get the business orders before Eastern agents are able to do so.

SILK CULTURE.—A lecture on "California's Future—Silk Culture and Manufacture," is announced to be given at Platt's Hall, on Friday evening, Feb. 14th, by Joseph Neumann, well known by his long connection with this important and growing California interest.

The Railroads of the Golden State.

Their Wonderful Growth.—Their Length in Miles.—The Regions Tapped by Them.—Their Future Development.

It has often been truly said, that there is nothing new under the sun; but to every rule there are exceptions, and moderns may boast exclusively of the four great instruments of civilization, the railroad, the steamship, the electric telegraph, and the printing press. The railroad in particular is the great civilization; it performs now the same service that the rough and hardy pioneer did a hundred years ago. It penetrates the deepest forests, reaches the remotest wilds, crosses the most tremendous mountain chains, and bridges the broadest, swiftest and deepest rivers. Population and wealth follow in its train, the forest recedes before it, the plain smiles with waving grain, towns and cities spring up as if by enchantment, States are founded. Population used to precede it, now it follows. From the mountainous character of the Pacific coast, much of it would have been doomed to remain in a state of nature for another half century but for the railroad. But now the progress being made in covering it, particularly California, with a network of railroads, is fast fitting it as a home for the poverty-stricken and landless millions of Europe and the East. And over our roads in the future, the current of the world's commerce will flow.

Growth of Our Railroad System

Though late, has been extremely rapid. It was six long years before the hardy forty-niners grew tired of mule teams, and began to think it was high time for them to be abreast of other communities in the matter of railroad communication, and fourteen before they seriously entered on the work of railroad building. Then, the excitement occasioned by the war of secession and by the fear that California might be invaded from Texas, or annexed by some country with which we might be at war, impressed on the nation the necessity of connecting San Francisco and New York, the East and the West, by the iron hand of a railroad. Finding that they were about being brought into connection with the great centers of American civilization and commerce, our people took the hint, and began the construction of the Sacramento and Folsom line, their first railroad, in 1855. This was finished in 1856, at a cost of \$1,100,000, and we had then 23 miles of railroad to boast of. A small beginning but one that was after some years followed vigorously and in a manner characteristic of California enterprise. The San Jose road, connecting with the beautiful city of the same name, was begun and finished in 1863, seven years after. And now may be said to have begun the period of railroad building in California. The project of building a grand trans-continental railroad had been mooted almost ever since the first rail was laid in the United States, but it was not till 1862, that a bill for its construction passed Congress. Immediately on the hills being passed, the builders of the road set to work with unwonted vigor. For the first three years 20 miles a year were built, in 1866, 30 miles, in 1867, 46 miles and so on till it was finished on the 10th of May, 1869, when the glad tidings were flashed over the wires, that the golden spike, that was to unite the East and West, was driven. From the time of the beginning of the work on the Central Pacific, railroad enterprises sprang up on every side. All the great towns of the State were anxious to be connected with the trans-continental line and already San Francisco was looking forward to the practicability of building another trans-continental line by the 34th or 35th parallels. The Western Pacific to connect San Francisco and San Jose with Sacramento, and this with the Central Pacific was chartered in 1862, but very little vigor was shown in its prosecution and it was not finished till September, 1869, a year and a half after it was begun, and four months after the completion of the Central Pacific. During the last three years, the following important railroads have been begun or have been pushed forward with vigor: The California and Oregon, the Northern Pacific, the Southern Pacific, and the San Joaquin Valley Railroad. The line from Los Angeles to San Pedro was finished in 1869. Our two greatest years of railroad building have been '69 and '70. During the former, we built 234 miles, and during the latter 223. In 1871 we only built 97 miles. In '63 we built 20 miles, in '64, 94 miles, in '65, 97 miles, in '66, 94 miles, in '67, 74 miles, and in '68, 86 miles. The

Existing Lines

Will make up when completed a grand total of 1,918½ miles in length. This shows that we are already acquiring the right to claim the reputation of being a railroad people. Yet, even a cursory examination of the map, will show how miserably inadequate our present system is, and what we have to do before we can afford to rest on our laurels, even for a short space of time. Three-fourths of California is as yet in a state of nature, not one-twentieth of the cultivable land is under cultivation, and as for our mines, we have hardly yet begun to know the extent of their riches. Hundreds of thousands of tons of ore that might be made to yield a profitable return, must be allowed to remain unutilized for want of cheap methods of transportation to the market. And the farmer will see his cattle and sheep driven from a market, or shut off by bare and inaccessible mountains from the outer world.

The Central Pacific.

Two hundred and seventy-six miles of which are in this State, is, whether considered in respect to the mighty energy employed in overcoming the obstacles both of nature and of lack of means, by its promoters, whether as a triumph of the highest exhibition of engineering skill afforded in our country, as evidenced by the rivers and chasms bridged, mountains tunneled and almost perpendicular ascents scaled, or whether regarded as one of the grand sections over which the commerce of the world must flow, is one of the greatest wonders of our age and time. Starting from Oakland it pursues its way through the center of the richest mining, agricultural and vine growing regions perhaps in the world. Leaving Oakland and passing by Brooklyn, Alameda, San Leandro and Decoto in a most beautiful and fertile country, it ascends the Mount Diablo range and passes through the bowels of the mountains in the tunnel of Livermore Pass, emerging on the other side in the hills that skirt the San Joaquin Valley. From Niles about half way between Oakland and this pass is the junction of the branch line that coming from San Jose girdles the bay.

Lathrop welcome to the junction of the great arterial line of the center of the San Joaquin Valley, and at Stockton to that of the Copperopolis road, destined

to skirt the whole of its western side. Crossing the 1,400 feet wide bridge over the Mokelumne, we arrive at the great inland railroad centre, Sacramento. Leaving this and crossing the comparatively level lands of the valley, and the pretty towns of Auburn and Colfax, the line enters the foothills of the Sierra Nevada, and soon climbs the mighty mountains themselves. Nothing for beauty, sublimity and terrific grandeur like the scenery from here to the borders of Nevada, is to be found in the world. The line climbs up and down hills and winds around them, spans terrific canons, and as in the case of Cape Horn, seems from the valley below to be almost suspended in the air from the summit of the mountains. A little beyond the great lumber depot of Truckee, it leaves the State, crosses the divide of the Trade of China, India, Australia and the islands of the East, the commerce of half a world. The cost of building it was \$91,378 per mile. In 1871 nearly half a million tons of freight passed over it and its income was nearly \$10,000,000.

The California Pacific Railroad

Will be, whether we consider the want of it, in conjunction with its branches, to supply a large extent of country, or the probability of a branch line from it being built to do the carrying-trade west of the Sacramento River.—One of the most important inland railroads in the State. Beginning at Vallejo and ending at Marysville, it passes through the richest agricultural districts in the State. Vallejo itself, an adjunct of San Francisco, must in the future become a great and important commercial, manufacturing and ship-building city. At present, through the California Pacific and its connecting lines, all the wheat of the western Sacramento Valley is poured into it. This road passes through one of the principal wheat-growing regions of the Coast,—one of the richest fields of waving grain. Northeast from Vallejo this line leads by a tunnel through the Suscol grain-covered hills; then past the thriving town of Woodland, through Davisville, a wheat-shipping centre, and eventually crosses the Sacramento by a splendid bridge, 600 feet long. From Davisville to Marysville, one of the most flourishing towns in the State,—its whole length is 165 miles. There is also a branch line connecting Vacca Station with Vacaville. At Marysville we find

The California and Oregon Railroad,

Which will reach from Roseville Station to Portland. It is now being rapidly pushed on, so as to reach the latter city and secure the trade of Oregon for the Central Pacific before the Northern Pacific is finished and is able to compete with it, and will soon be on the borders of Oregon. It will then have a length within California of two hundred miles. The section which it traverses is as fertile as any in the State, and its upper part, which comprises the counties of Shasta and Siskiyou, possesses, on its mountains, inexhaustible forests, the produce of which will, at no distant day, when carried down by rail to San Francisco and shipped thence by sea, supply all parts of the world with lumber. The railway will, too, open up the numerous and fertile valleys to be found in Northern California and Southern Oregon to the agriculturist, and conduce to their speedy settlement. This line passes, after leaving Marysville, through Chico, Tebama and Red Bluff, by Shasta and Yreka, to the borders of Oregon. Probably the most important of the internal lines is

The San Joaquin Valley Road,

Now completed to a short distance beyond Visalia, and which is 167 miles long—the largest road yet built in California. The valley is in parts 140 miles wide, and contains over six millions of acres of rich agricultural lands. Besides these, the country is covered with stock-raising lands, and the hilly and mountainous country bordering is capable of sustaining millions of sheep and cattle and of growing fruit and wine enough to supply all America. The whole western side of the San Joaquin Valley for more than one hundred miles, is now one vast wheat field, and it has been estimated that it would take four trains a day, of twenty cars each, to bring all the grain raised in the State to the coast. It will be in another year or two. Cotton, sugar, hemp and rice will be reckoned amongst the products of this valley, which will find an outlet over one or other of the many projected lines. The present one passes within six miles of Visalia, leaving that town to a certain extent out in the cold. But already are the Visalians bestirring themselves to take revenge, and inviting the approach of competing lines.

The North Pacific and Humboldt Railroad

Opens up the greatest lumber region of the Coast. Beginning at Donabue, it passes through Sonoma, Mendocino and Humboldt counties ending at Humboldt, a distance of about 300 miles from the starting point. It brings Petaluma, Santa Rosa, Healdsburg, Ukiah and Eureka, the centre of the lumber region of Humboldt and Del Norte counties, into quick and easy communication with the city, factoring the growing district, particularly in Russian River Valley, and has increased the value of the lands on the route, in some instances, as much as fifty per cent. The mountains that skirt the Coast are covered with magnificent forests, which will for another half century supply the manufacturing needs of San Francisco and the ship building ones of Vallejo. The scenery of the Coast range and Coast valley from Donabue is of the most picturesque description. The road has been opened to Cloverdale, 55 miles from Donabue; and the track is being laid down beyond that town with the utmost expedition. The first part of the line has cost \$13,000 per mile.

The Southern Pacific,

Intended to connect with the Texas or Atlantic and Pacific Roads has been finished as far as Hollister, 94 miles from this city, connecting by a branch line with Pajaro, and about to be connected by another with Santa Cruz. It passes through the beautiful and fertile valley of Santa Clara, connecting with San Francisco, San Jose, one of the largest cities in the State, Gilroy the center of what promises to be an immense tobacco growing district, and Hollister one of the most thriving towns in the southern section. Crossing the Mt. Diablo range probably through Pacheco Pass, it is proposed to run in a southeasterly direction through the lower San Joaquin Valley, approaching the San Joaquin River at Firebaugh's Ferry, then near Fresno City and north of the Tulare Lake to a point 20 miles below Visalia, then southward to Bakersfield, and through the range between the San Joaquin Valley to the South Tebatuchay Pass, thence nearly on the line of the 35th parallel to a point on the Colorado south of Fort Mohave, there forming a junction with the Texas Pacific. Twenty miles of it have already been built opposite Visalia beginning at Goshen.

Other Lines

Already built, but not of such importance as the foregoing, form the outlets to fertile and well cultivated districts, or necessary connections between other lines. They are, the Napa Valley Railroad starting from the California Pacific at a point seven miles northeast of Vallejo, and following the beautiful and fertile valley of the same name to Calistoga, 34 miles long; the San Rafael and Sonoma Railroad, 14 miles long; the two towns 14 miles long; the Marysville and Oroville Road, 26 miles long; the Sacramento Valley Railroad, connecting Sacramento and Folsom, and Folsom and Shingle Springs, passing to within 12 miles of Placerville, 49 miles long; the Stockton and Copperopolis Railroad conveying the product of the valuable copper mines of that section, to the Central Pacific line, and thence to this city, 11 miles long; the Milford eleven miles from Copperopolis, and 30 miles long; the connecting line between Niles Station and San Jose, 12 miles long; the Los Angeles and San Pedro line 22 miles in length, connecting the future capital of the south with its port; the branch line from Gilroy to Salinas, 34 miles in length; the San Pablo and Tulare Railroad grading from seven miles in length from Northville and Summerfield to New York and Pittsburg on the Sacramento, bringing down the coal of

Mount Diablo; the Alameda and Haywards line 17 miles; a short line from Sacramento to Freeport; the first section of the Stockton and Visalia railroad, which will run from Peters by Cotton Ferry to Visalia, now finished to Oakdale, a distance of 19 miles; and a line beginning 3½ miles west of Banta Station on the Central Pacific, intended to run down the western side of the San Joaquin Valley. The total length of all the lines which we have noticed in this article is, at present 1,131½ miles, when completed it will be 2,058½ miles. Besides these are numerous

Projected Lines,

And one, the Texas Pacific, which entering the State near its southern boundary on the Colorado River, will terminate in San Diego, opening up an immense extent of agricultural and mining country in Arizona and Southern California. Of the projected roads the most important to the State, and to our citizens generally is the Atlantic and Pacific from this city to St. Louis, 2,000 miles long, 300 miles of which runs through what will be in the future one of the richest parts of the State, which will not be affected by snow blockades, and will enable us to run it southerly along the coast to San Buenaventura, and thence by a route passing through Los Angeles and San Bernardino, to a point below Fort Mohave on the Colorado. Other projected roads are a coast road from San Francisco to San Diego, the North Pacific Coast Railroad from San Rafael to the Walhalla River; the California and Pacific extension to Red Bluff; the connecting line between the California and Pacific and Sacramento; the Bay shore line from Antioch to Oakland; the Sacramento Valley Railroad extension to Placer; the Copperopolis and Visalia Railroad; the Antioch and Visalia Railroad; a line from Visalia to Owens River; the extension of the San Pedro and Los Angeles road to San Bernardino, and south into Arizona; a line connecting Visalia and Los Angeles, another connecting San Diego and San Bernardino, and one from San Francisco by Sausalito, through Mendocino and Humboldt counties to Humboldt Bay, with branches leading into Napa and Sonoma counties, etc. The total length of these various lines would be upwards of 1,950 miles. The

Railroad Future of California

is most brilliant. We may predict that within the next decade there will be 4,000 miles in operation, and thus every part of our State with its magnificent resources, will be brought within easy reach of a profitable market, and thus afford inducements for the settlement of tens of thousands, who have hitherto been debarred seeking their fortunes by the broad waters of the Pacific. And the immense trade that will center in San Francisco from both the East and West, and in San Diego from Mexico, Arizona, Colorado and Texas will be something which is even now undreamt of.

NEW MACHINE WORKS.—The California Machine Works are just getting under way in a neat new building, No. 119 Beale street, in this city. The proprietors are Messrs. Alex. Steiger, John Argall, and Martial Hainque, who are also sole agents and manufacturers of Argall's steam heater and purifier, and Bargion's patent hubs and axles for wheels of agricultural machines, wagons etc. The firm intend manufacturing all descriptions of hoisting, pumping and mining machinery, quartz, saw and flour mills, and different kinds of iron and brass work. The majority of the tools for the shop are now on the way here from New Haven but the engine was started up this week. Particular attention is to be paid to general repairs, etc. The new shop is commodious and neat and the proprietors will endeavor to merit a generous share of public patronage.

THE HORSE DISEASE IN NEVADA.—The epizootic which has raged so extensively in the East of late has reached Nevada and is spreading there as it has done in other places. Horses and mules are alike affected by it and a stagnation of business is the consequence. At Eureka all the furnaces except the Ruby Consolidate have shut down and an effort is being made to reduce the wages of the miners employed at the Eureka Consolidate. A dispatch states that a number of them have quit work to go elsewhere. Ox teams have begun to haul freight from the railroad but the transportation of ore, etc., will be discontinued for the present. Business at Hamilton, White Pine, Pioche and Eureka is seriously affected.

PERSONAL.—We understand that Mr. Henry Sewell, mining engineer, is on a tour through the quicksilver mines of California, in the interest of a London firm. Mr. Sewell's long and practical experience in the mines of Almaden in Spain, and those of Mexico and Peru, undoubtedly warrant his countrymen in selecting him for the above purpose. We hope soon to publish his letter No. 2 on the "Quicksilver Mines of Almaden, Spain" in which we will describe, from his own personal observation, the geology and formation of these celebrated mines.

ASIATIC QUAIL.—Messrs. Liddle & Keating, of San Francisco, have received a lot of fifty Asiatic quail by the last steamer which are to be turned loose on the farm of Millard & Shafter, in Marin county, and on the property of Mr. Thompson in this county, that they may propagate and become domesticated in California. The quail is about the size of the California meadow lark, and is not unlike that bird in color.

AERIAL NAVIGATION.—San Francisco is being treated to the somewhat novel exhibition of balloon ascensions. Last Saturday, the balloon "New World" made an ascent from Woodward's Gardens, with four aeronauts, and the adventure will be repeated to-day. We have had a number of hot-air balloons before, but a gas balloon is a novelty in this city.

Scott's Wheel Moulding Machine.

We present to our readers this week a cut of Scott's Wheel Moulding Machine, for moulding gear wheels of every description, something which has been for some time in use in Europe and which seems particularly applicable for California. It has only recently been introduced in the Eastern States and is of great importance to iron foundries and all who have to bear the expense of producing gear wheels, or cast wheels of any description. It entirely obviates the necessity of having a pattern wheel, thereby effecting a great saving of expense in the production of moulds. It also insures the production of gear, or other wheels of assured accuracy of construction. The machine is able to mould spur, bevel, mortise or worm wheels, (plain or shrouded) fly wheels or pulleys, whole or fitted in segments, from 12 inches to 12 feet in diameter, from one inch to 18 inches face, in an accurate manner. A reference to the cut in connection with the following brief description will enable any one to form a correct idea of the apparatus.

The machine is portable, and may be readily moved to any part of the foundry, by attaching the foundry crane to the eye-bolt upon the top of the central shaft. It consists, first, of a pedestal to be imbedded about fifteen inches below the general level of the foundry, which supports a central vertical shaft, upon which the machine proper revolves; this may be adjusted at any height, to accommodate any required width of face. This adjustable machine consists of a slotted horizontal radial arm which carries at one end a vertical sliding ram, to which the segment of pattern is attached; the horizontal arm is adjustable by a long traverse side screw. The radial arm and ram are revolved by a large and carefully made worm wheel, by which the requisite angular motions corresponding to any desired pitch, are obtained in a manner similar to that by which the same is obtained in an ordinary gear cutting machine.

To obtain all the varieties of pitch from 20 to 560 teeth, a set of change wheels are employed, these are operated by a crank, the handle of which is convenient to the operator. The ram and segment are also moved vertically by another crank also convenient to his left hand. All that is required for the moulding of a wheel by this machine is a segment of two teeth, a core box for the arms and boss, and a board for striking the top and bottom of the wheel. Wheels are moulded by a segment of two teeth fixed upon the end of a revolving trammel, adjustable to the required diameter; the spacing of the teeth being effected by mechanism, the exact equivalent of that used to space the teeth in a gear cutting machine, as a consequence the teeth of all wheels cast by this machine, are as true as those which are cut by a Gear Cutter, and are much better, as the hard crust of the cast iron is preserved, and is in effect equal to steel, and produced at a greatly reduced cost. Gear wheels to fit a worm screw accurately can be moulded by this machine, and any other desired form of teeth which cannot be moulded by a pattern, can be as readily moulded as straight teeth.

In constructing wheels for the heavy hoisting apparatus now in use in our mines this is an invaluable agent. These wheels, which used to be large when they weighed 5,000 pounds, are made now weighing from 20,000 upwards and even 11 tons. When a wheel of this description is broken at a mine it is quite an extensive job to replace it. It is well known to foundries that patterns, especially in this country are liable to variation by contraction and expansion from atmospheric causes, and that no accurate wheel can be cast from a pattern thus changed until the additional expense of repairing is incurred; and in some instances a pattern is injured to such an extent that its perfect restoration is impossible. When an old pattern is used the wheel is not so good as in the first case for the reason mentioned above.

A foundry in Virginia City or elsewhere with this machine could immediately replace a broken wheel even as large as those at the Gould & Curry or Hale & Norcross mines. It makes them of any size and exactly true. In case of a fire at the foundry where the patterns are kept this machine could reproduce any wheel required without the necessity of new patterns being made, and at much less cost than where patterns are required. The manufacturers, the New York Moulding Machine Company

give the following illustration of the difference in cost of making a wheel by this machine and by the old method of moulding, giving the cost in days' labor instead of money value, so that a comparison can be more readily made, the rates of wages varying in different localities. A wheel was required to be cast four feet two inches in diameter at the pitch line, four-inch pitch, and 12½ inches broad. The construction of the pattern for the wheel cost 19 days and eight hours' labor. The construction of the woodwork for casting the same wheel by the Scott machine, cost only one day and five hours' labor. Another great advantage it has, is that a variety of patterns is dispensed with, and it is not necessary to keep a large stock of them on hand. One of these machines can be seen at David Stoddard's machine shop, 114 Beale street.

The Frear Stone in San Francisco.

The Frear Stone which proved so refractory to the action of fire in the great Chicago conflagration, and which is now playing so important a part in the reconstruction of that city is rapidly making its way into public favor in San Francisco.

It has been largely employed in the Niantic building, corner of Clay and Sansome streets, for buttresses, window caps and keystones. It

SCOTT'S PATENT WHEEL-MOULDING MACHINE.

also forms the ornamenting and projecting parts of the large three story building now being erected at the corner of Townsend and Fourth streets for the Central Pacific Railroad offices. The foundation of Tallant's large bank building corner of California and Battery streets, consists of this stone, which was placed in position when but two weeks old, and was even then considered amply firm enough to sustain the immense weight of the entire building.

We have a sample of this stone in our office, which presents the appearance of a beautiful clear sandstone. Other and larger samples can be seen at the Company's office, 638 Market street. It has successfully stood the test of fire and frost, of the sledge hammer and the crushing press, and is now considered fully equal, under all circumstances to which building stone is ever subjected, to the best class of natural building stone. There can be little doubt but that this durable and beautiful artificial stone is destined, at no distant day, to measurably supersede almost every other class of imperishable building material.

SIGNAL SERVICE BUREAU.—We have received from Gen. Albert J. Meyer, Chief Signal officer of the United States army, his annual report for 1872, to the War Department. It contains much interesting information in relation to this important branch of the Service, with a record of what has been accomplished, and instructions for meteorologists. The different instruments used are described at length with engravings, diagrams, etc.

Railroad Items, Etc.

It is currently reported that the Southern Pacific Railroad has been sold to Thomas Scott by Governor Stanford. The Southern Pacific runs from this city by way of San José and Gilroy through the Salinas Valley and connects with roads to San Diego by way of Los Angeles, finally meeting the 32d parallel road now being built. It is not known whether this is really the case, but the *Chronicle* thinks that the probabilities very strongly point to that consummation.

The North Pacific Railroad, which was sold by Peter Donahoe to the Central Pacific for \$750,000 some time since, has been repurchased by that gentleman for \$1,000,000, according to the *Petaluma Argus*. Rumors to this effect have been current for some days. The road runs from Vallejo by way of Petaluma and Healdsburg to Cloverdale.

A dispatch dated Chicago, Jan. 23th, states that a Washington special says that it is rumored there that a pool is now being formed in which the Bank of California and the Central Pacific Railroad Company are the responsible parties, for the purchase of the Union Pacific Railroad in case the June interest on the bonds of the latter corporation go to protest, which is regarded as highly probable, in

Legitimate Labor vs. Speculation.

By ALMARIN B. PAUL.

No system of speculation ever builds up a country in material wealth, or a people in a moral sense, and it matters not whether a gain is made from wheat, trade or mining.

Legitimate labor is ever a producer, whether applied to commerce, mining or agriculture, and whether the individual is personally benefited or not. Every bar of metal thrown into circulation, every grain of wheat raised, gives forth some good. It therefore behooves all to give greater encouragement to legitimate endeavors, and to discountenance speculation. Of all countries, California, from the previous condition of things, possibly, holds a larger percentage of speculators than any portion of the civilized world, and by far the largest number are embraced among the

Mining Fraternity.

The past year has presented some fine illustrations of the speculative spirit which pervades this coast, and how powerful "speculation" is, to draw open the purses of our prominent men of finance, while silk culture and a horde of other important interests are left to fight the battle of poverty for want of legitimate aid.

A million of dollars for diamond fields—unknown—while so many interests are lavishing!

It is to say lamentable, and by no means creditable, to those whose wealth point them out as those who should only associate their capital and names for higher, and more legitimate purposes, such as the building up of hives of industry. But enough of this, my object now is, to stir a certain class of miners, to more legitimate labor. Those who are ever on the prospect—the "hold out" and "bond," and never consummate anything; those who "speculate;" those who now and then play with stocks, and think they are smart, but soon find out they are enveloped by as powerful a sucker as Higo's devil fish.

There is no doubt but all will admit that the road having the most sweet bread for the traveler, is in the course of legitimate endeavors; those who travel on it, can generally sleep sound and pay their way as they go.

Nature has thrown broadcast her precious metals that men may delve and reap their rewards in an honest pursuit of wealth, and only legitimate labors can produce it.

That there must be some venture as connected with mining all must grant, but even this should be based on our endeavor to produce interest upon capital invested.

Strictly speaking, after a reasonable expenditure for development of a mine, and for machinery to reduce ore, unless mines pay a revenue, they are not worth having; and it is about time the whole mining community accepted this idea of value. Profit alone should create value, and not manipulations behind the scenes, and that value estimated as interest on money.

One great point for the bringing forth of more legitimate mining is for the mining communities to keep their capital among themselves, instead of rushing all their gains into the banks of San Francisco. This can be done by forming Savings and Loan Associations, as those of this city, and whereby capital can be disbursed among themselves.

Away from San Francisco, all complain that no loans can be had from this city on their property. There are several good reasons for this. 1st.—The farther from home you send capital the less can be made out of it. It has left home-avenues of trade. 2d.—Capital in the city can form no correct estimate value of country property, and, besides, don't want to. Loan societies of their own could always loan understandingly, and, besides, would acknowledge a greater value.

This lack of a little capital in localities where needed, induces much speculation, as it leaves the miser with the only hope of rushing to San Francisco for "capital," where he gets his property "stocked," and then, unless money can be made by "speculation" out of paper, little is done. That locality "wits" for capital, whereas, on the other hand, with a little from home, a revenue would be the result. There is one fact which has forced itself very strongly upon my mind in this connection, viz.: that men of even small means,—and who could cooperate with their limited capital,—are more disposed to waste it in stock speculations than to organize, cooperate, open mines and erect machinery in accordance with their united capital.

Legitimate mining, though as a very small beginning, has more success to show for the endeavors made than where there has been the advantages of a large amount of capital. There is much truth in the saying that small beginnings make large endings. Legitimate endeavors augment, while speculation totters and soon falls with a crash. The one enriches and elevates the individual and a people, the other demoralizes and drags down. There is neither money nor morale in so much speculation; so let us drop it and build up ourselves and State in fostering those industries and ventures which have reality at the back of them.

SAN JOAQUIN VALLEY NARROW GAUGE ROAD.—Enough money has been paid in, according to the *Stockton Republican*, to organize the Stockton and Visalia Narrow Gauge Railroad Company and arrangements are now being made to incorporate it.

Laws Under New California Code—Taking Effect Jan. 1, 1873.

Formation of Corporations.

(Continued from page 58.)

[Five corporators, three to be citizens of the State to sign articles and acknowledge the same.]

292. The articles of incorporation must be subscribed by five or more persons, three of whom must be citizens of this State, and acknowledged by each before some officer authorized to take and certify acknowledgments of grants of real property.

[Prerequisite to filing articles.]

293. Each intended corporation named in Section 291, before filing articles of incorporation, must have actually subscribed to its capital stock, for each mile of the contemplated work, the following amounts, to wit:

[Amounts to be subscribed to be affixed.]

1. One thousand dollars per mile of railroads;
2. One hundred dollars per mile of telegraph lines;
3. Three hundred dollars per mile of wagon roads.

[Prerequisite to filing articles of corporations for profit.]

294. Before the articles of incorporation of any corporation referred to in the preceding section are filed, there must be paid for the benefit of the corporation, to a Treasurer elected by the subscribers, ten per cent. of the amount subscribed.

[Oath of officer to subscription of stock and payment of ten per cent.]

295. Before the Secretary of State issues to any such corporation a certificate of the filing of articles of incorporation, there must be filed in his office an affidavit of the President, Secretary or Treasurer named in the articles, that the required amount of the capital stock thereof has been actually subscribed, and ten per cent. thereof actually paid to a Treasurer for the benefit of this corporation.

[To file articles with County Clerk and Secretary of State, and receive certificate. Term of existence.]

296. Upon the filing of the articles of incorporation in the office of the County Clerk in the county where the business of the company is to be transacted, and a copy thereof with the Secretary of State, the Secretary of State must issue to the corporation over the great seal of the State, a certificate that such articles, containing the required statement of facts, have been filed in his office, and thereafter the persons signing the same, and their associates and assigns, are a body politic and corporate, by the name stated in the certificate, and for the term of fifty years, unless it is in the articles of incorporation otherwise stated, or in this Part otherwise specially provided.

[Certified copy of certificate to be prima facie evidence of its contents.]

297. A copy of any articles of incorporation filed in pursuance of this Chapter, and certified by the Secretary of State, must be received in all the Courts and other places as primary evidence of the facts therein stated.

[Who are members and who stockholders of a corporation.]

298. The owners of shares in a corporation which has a capital stock are called stockholders. If a corporation has no capital stock, the corporators and their successors are called members.

[When members die successors to be elected.]

299. If a member of a corporation dies, resigns, or is removed, a majority of the remaining members may elect another in his place.

By-Laws, Directors, Elections and Meetings.

[Adoption of by-laws, when, how, and by whom.]

301. Every corporation formed under this Title must, at a meeting of its stockholders or members, to be held within one month after filing articles of incorporation, adopt a code of by-laws for its government not inconsistent with the Constitution and laws of this State. Notice of such meeting, by order of the acting President, specifying its object, must be published two weeks in some newspaper published in the county where the meeting is to be held; or, if none is published therein, then in a paper published in an adjoining county. In the adoption of the by-laws, each stockholder has as many votes as he holds shares of the stock; if there is no capital stock, each member has one vote. A majority of all the subscribed capital stock, or of the members, if there is no capital stock, is necessary to adopt the by-laws, or any one of them.

[Directors, election of, etc.]

302. The Directors of a corporation must be elected annually by the stockholders or members, and if no provision is made in the by-laws for the time of election, the election must be held the first Tuesday in June. Notice of such election must be given, and the right to vote determined as prescribed in Section 301.

[By-laws may provide for what.]

303. A corporation may, by its by-laws, where no other provision is specially made, provide:

1. The time, place, and manner of calling and conducting their meetings;
2. The number of stockholders or members, or the quantity of stock constituting a quorum;
3. The number of shares which entitles the stockholders respectively to one or more votes;
4. The mode of voting by proxy;
5. The time and place of the annual election for Directors, and the mode and manner of giving notice thereof;
6. The mode of selling shares for the non-payment of assessments or installments.
7. The compensation and duties of officers.
8. The tenure of office of subordinate officers; and,
9. Suitable penalties for violations of by-laws, not exceeding, in any case, one hundred dollars for any one offense.

[By-laws recorded and how amended.]

304. All by-laws adopted must be certified by the officers of the corporation, and filed and recorded in the Recorder's office of the county where the principal place of business of the corporation is located. The by-laws thus adopted must not be altered or amended, except at a special meeting of the stockholders or members, to be called by the Directors for that purpose, specifying in the order the proposed amendments; and a two-third vote of all the subscribed capital stock, or of the members is necessary to adopt the same. And the amendments thus adopted must be certified and recorded in the same manner as the original by-laws.

[How many and who to be Directors.]

305. The corporate powers, business, and property of all corporations formed under this Title must be exercised, conducted, and controlled by a Board of not less than five nor more than eleven Directors, to be elected from among the holders of stock; or where there is no capital stock, then from the members of such corporation. A majority of the Directors must be citizens of this State. Directors of corporations for profit must be holders of stock therein in an amount to be fixed by the by-laws of the corporation. Directors of all other corporations must be members thereof. Unless a quorum is present and acting, no business performed or act done is valid as against the corporation. Whenever a vacancy occurs in the office of Director, unless the by-laws of the corporation otherwise provide, such vacancy must be filled by an appointee of the Board.

[Corporations at first meeting to elect Directors and adopt by-laws.]

306. At the first meeting called, as soon as the by-laws are adopted, unless it is provided that the officers named in the articles of incorporation shall continue until a certain other date, Directors must be elected, a majority of the subscribed capital stock, or of the members being necessary to a choice.

[Elections, how conducted.]

307. All elections must be by ballot, and unless otherwise prescribed by the by-laws, a majority of the subscribed capital stock or of the members is necessary to a choice.

[Organization of Board of Directors, etc.]

308. Immediately after their election, the Directors must organize by the election of a President, who must be one of their number, a Secretary and a Treasurer. They must perform the duties enjoined on them by law and the by-laws of the corporation. A majority of the Directors is a sufficient number to form a Board for the

transaction of business, and every decision of a majority of the Directors forming such Board, made when duly assembled, is valid as a corporate act.

[Dividends to be made from surplus profits.]

309. The Directors of corporations must not make dividends, except from the surplus profits arising from the business thereof; nor must they divide, withdraw, or pay to the stockholders, or any of them, any part of the capital stock, nor must they create debts beyond their prescribed capital stock, or reduce or increase the capital stock, except as hereinafter specially provided. For a violation of the provisions of this section, the Directors under whose administration the same may have happened (except those who may have caused their dissent therefrom to be entered at large on the minutes of the Directors at this time, or were not present when the same did happen) are, in their individual and private capacity, jointly and severally liable to the corporation, and to the creditors thereof, in the event of its dissolution, to the full amount of the capital stock so divided, withdrawn, paid out, or reduced, or debt contracted; and no statute of limitations is a bar to any suit against such Directors for any sums for which they are made liable by this section. There may, however, be a division and distribution of the capital stock of any corporation which remains after the payment of all its debts, upon its dissolution or the expiration of its term of existence.

[Removal from office of Directors, etc.]

310. No Director shall be removed from office, unless by a vote of two-thirds of the members or of stockholders holding two-thirds of the capital stock, at a general meeting held after previous notice of this time and place, and of the intention to propose such removal. Meetings of stockholders for this purpose may be called by the President or by a majority of the Directors, or by members or stockholders holding at least one half of the votes. Such calls must be in writing, and addressed to the Secretary, who must thereupon give notice of the time, place, and object of the meeting, and by whose order it is called. If the Secretary refuse to give the notice, or if there is none, the call may be addressed directly to the members or stockholders, and be served as a notice, in which case it must specify the time and place of meeting. The notice must be given in the manner provided in Section 301 of this Title, unless other express provision has been made therefor in the by-laws. In case of removal, the vacancy may be filled by election at the same meeting.

[Justice of the Peace may order meeting, when.]

311. Whenever, from any cause, there is no person authorized to call or to preside at a meeting of a corporation, any Justice of the Peace of the county where such corporation is established, may, on written application of three or more stockholders or of the members thereof, issue a warrant to one of the stockholders or members directing him to call a meeting of the corporation, by giving the notice required, and the Justice may in the same warrant direct such person to preside at such meeting until a Clerk is chosen and qualified, if there is no other officer present legally authorized to preside thereat.

[Majority of stock must be represented, and a majority vote together, otherwise it is fraudulent.]

312. At all elections or votes had for any purpose there must be a majority of the subscribed capital stock, or of the members, represented, either in person or by proxy in writing. Every person acting therein, in person or by proxy or representative, must be a member thereof or a bona-fide stockholder, having stock in his own name on the stock books of the corporation at least ten days prior to the election. Any vote or election had other than in accordance with the provisions of this Article is voidable at the instance of absent stockholders or members, and may be set aside by petition to the District Court of the county where the same was held. Any regular or called meeting of the stockholders or members may adjourn from day to day, or from time to time, if for any reason there is not present a majority of the subscribed stock or members, or no election or majority vote had—such adjournment and the reasons thereof being recorded in the journal of proceedings of the Board of Directors.

[All stock may be represented in votes.]

313. The share of stock of an estate of a minor, insane, or deceased person, may be represented at all elections and meetings of the corporation by the legal representative of the person holding the same.

[Election may be postponed.]

314. If from any cause an election does not take place on the day appointed in the by-laws, it may be held on any day thereafter as is provided for in such by-laws, or to which such election may be adjourned or ordered by the Directors. If an election has not been held at the appointed time, and no adjourned or other meeting for the purpose has been ordered by the Directors, a meeting may be called by the stockholders, as provided in Section 310 of this Article.

[Complaints and quo warranto and proceedings thereon regarding elections.]

315. Upon the application of any person or body corporate aggrieved by any election held by any corporate body, or any proceedings thereof, the District Judge of the district in which such election is held must proceed forthwith summarily to hear the allegations and proofs of the parties, or otherwise inquire into the matters of the complaint, and thereupon confirm the election, order a new one, or direct such other relief in the premises as accords with right and justice. Before any proceedings are had under this section five days' notice thereof must be given to the adverse party, or those to be affected thereby.

To be Continued.

Virginia and Gold Hill Water Company.

This company, says the Gold Hill News, has completed all the grading for the foundation of their flume, both this side of Washoe Valley and beyond up into the foothills of the Sierra Nevada mountains. It yet remains to dig the trench across the valley, in which the huge iron pipe is to be laid. This pipe is now being manufactured in San Francisco and will be ready to be laid sometime in March. There is still a vast amount of work to be done in the way of flume building, to say nothing of the work of laying the pipe. On the summit of the ridge, in a southerly direction from the Ophir Grade toll-house, will be built an immense reservoir, from which the mines and mills of Gold Hill and Gold Cañon generally will be supplied. Work has not yet commenced on this reservoir, we believe, but we presume men will be set to work upon it early in the spring. The company will be able to give employment to a great number of men during the coming spring and summer. We hope they will push the work as rapidly as possible, as water is likely to be a scarce article in Gold Hill during the coming season; in fact, before the recent good storm water was not to be had for drinking and culinary purposes, and most of that was hauled from American Flat. We noticed yesterday that water is being hauled down into town on sleds from the Imperial hoisting works. Push the work as they may the company cannot bring the water in any too soon to meet the requirements of our people. There will be great rejoicing when we can have in all our homes the pure water of the Sierra Nevada mountains.

GRASS VALLEY MINES.—To look at and ride over, the main streets of Grass Valley, would induce a stranger to answer "Old Block's" question, "Is Grass Valley played out?" in the affirmative; but this reports from the mines in the vicinity would soon destroy the impression and the dilapidated condition of the streets could be accounted for in the lack of enterprise on the part of property holders. The mines are improving continually. The recent strike in the North Star is most encouraging from the fact that it is the deepest mine in the district, and the croakers had begun to say quartz would not yield at great depths and to point to the North star as an example. Now that these predictions have failed and the rock has been found, these same class exclaim "I told you so all the time. All it wants to make a mine pay is to go down on it." We understand that the mining prospect is most encouraging and there are numerous chances in the vicinity for opening just as rich mines as Grass Valley has ever boasted of. All that is required is capital controlled by men who understand the business of mining. We hope soon to hear of new projects backed by capital and we are confident in such an event new and rich mines will be multiplied in Grass Valley district.—*Transcript*.

Two years ago a lead mine was discovered in Hardin County, Ill. The ore was rich and plenty, but no process of smelting had been discovered which would master the unusual combination of minerals contained in this ore. The Mineral City Mining Company has at last discovered the secret, and confirmed the victory by a \$6,000 cash sale of the same.

ELNA is acquiring increased importance for her iron ore. During the month of July, 1872, she exported 14,556 tons, of which 18,000 tons were sent to France.

of Architects, Engineers and the public in general, to
the SUPERIOR QUALITY of the Stone now being manu-
factured by them in this city under the Ransome
Patents. They make to order and keep in stock:

Building Fronts, Water Pipe
Sinkes, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grind-
stones, all of which we guarantee superior, and at a
price far below that of hand-cut work.

The attention of private parties intending to build is
respectfully solicited.
OFFICE, No. 10 BUSH STREET, San Francisco.

EUCALYPTUS.

The attention of the Medical profession is respect-
fully called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of intermittent and Marsh
Fever, often supplanting the use of Quinine. The
paroxysms of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Blad-
der it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.
This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus
THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves
in a palatable form and elegant appearance. Does—
One tablespoonful, to be repeated as often as the case
demands.
Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.
Prepared and sold by JAMES G. STEELE & CO.,
Chemists and Apothecaries,
No. 621 Montgomery St., between Clay and Commercial,
San Francisco. 11128

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE
Caution Against Fraud.
The success of this most
delicious and unrivalled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.
Some of the foreign markets having been
supplied with a spurious Worcestershire
sauce, upon the wrapper and labels of which the names
of Lea and Perrins have been forged, L. & P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-
ter; Crosse & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. 15124-14

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco

Richardson & Co., Copper Ore Wharves,
SWANSEA.

RICHARDSON & Co. have been for thirty years established
in Swansea as Agents for the preparation, Sampling, Assay-
ing, and Sale of Copper, Silver, Gold, Lead, Zinc, and al-
other Ores and Metals, for which they have extensive Ware-
houses and Wharves under cover, 1,400 feet of Quay Front-
age within the Floating Dock, and the most complete Ma-
chinery and Appliances. They are also prepared to make
advances against Ores in anticipation of realization, and to
guarantee all payments when required. 11721-14

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.
By Special Dispatch, Dated Washington, D. C., Jan. 28th, 1873.

FOR WEEK ENDING JANUARY 14th, 1873.

NEEDLE CASE.—Gerhard Wempe, S. F., Cal. SEDIMENT COLLECTOR AND BLOW OFF FOR STEAM BOILERS.—John P. Leonard and George Hancock, Oroville, Cal.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

New Incorporations.

The following companies have filed certificates of incorporation at the County Clerk's Office in this city:

GUADALUPE ISLAND CO.—Jan. 23. Object: Agriculture and Stock Raising, and the improvement of the breed of domestic animals. Capital stock, \$500,000, in shares of \$50 each. Trustees—George N. Dent, Henry Delahide, Cassius C. Palmer, of San Francisco; Wm. M. Landrum, and Jesse M. Rodgers, of Watsonville.

GERMANIA M. CO.—Jan. 25. Location: State of Nevada and Territory of Utah. Capital stock, \$3,000,000. Trustees—George Helm, William Lephman, Samuel Purdy, Frank Moyer, F. C. Jessup.

HYDROLENE M. CO.—Jan. 25. Location: California, Nevada and Utah. Capital stock, \$1,000,000. Trustees—Alexander L. Warner, Ezekiel Tripp, Spafford O. Field, C. O. Warner and D. K. Tripp.

BLUE POINT GRAVEL M. CO.—Jan. 29. Location: Blue Point claims, in Shesler Flat, and Empire Mining District, Rose's Bar, Yuba Co., Cal. Capital stock, \$12,000, in 24 shares of \$500 each. Trustees—Lyman Ackley, R. Cray and J. Whalan. The principal place of business has been removed from Smartsville to San Francisco.

SAN GABRIEL M. CO.—Jan. 29. Location: Los Angeles County. Capital stock, \$500,000, in shares of \$100 each. Trustees—Robert T. Patterson, Everton W. Hawley, Henry H. Allen, Wm. McDonald and Geo. Spencer.

PATTERSON & HAWLEY PLACES M. CO.—Jan. 29. Location: Los Angeles County. Capital stock, \$500,000, in shares of \$100 each. Trustees—Robert T. Patterson, Everton W. Hawley, Henry H. Allen, Wm. McDonald, George W. Spencer.

Meetings and Elections.

SPRING MOUNT M. CO.—Jan. 27. Trustees—L. Maynard, Thomas Ball, C. D. Sullivan, J. H. Baird and R. S. Floyd.

SAN JUAN DEL RIO M. CO.—Trustees—John E. Magee, Chas. W. Coon, John W. Dwinelle, Jasper O'Farrell and William E. Darby.

LANE AND KURTZ CARBON M. CO.—Jan. 27. Trustees—Joseph Clark (President), Ira P. Rankin, George Hearst, J. B. Haggin, C. R. Greathouse, B. B. Morrow, Secretary, Superintendent, C. C. Lane.

BLACK DIAMOND COAL CO.—Jan. 22. Trustees—D. O. Mills, A. Hayward, P. B. Cornwall (President), Thomas Bell and John Bensley.

BELLINGHAM BAY COAL CO.—Jan. 22. Trustees—D. O. Mills, A. Hayward, P. B. Cornwall (President), Thomas Bell and John Bensley.

BELCHER M. CO.—Jan. 23. Trustees—J. D. Fry (President), A. R. P. Harmon (Vice-President), R. F. Morrow, James H. Dobson and B. F. Sherwood; Secretary, H. C. Kibbe; Superintendent, W. H. Smith.

RAYMOND & ELY M. CO.—Trustees—Alphus Bull (President and Treasurer), W. H. Raymond, S. F. Butterworth and Henry Raymond; A. J. Moulder was re-elected Secretary.

INCREASE OF CAPITAL STOCK.—Sutro Tunnel Co.—Jan. 23. Capital stock increased from \$12,000,000 to \$15,000,000, in shares of \$10 each. Capital stock fully paid-in is \$1,032,122.25, and there are no debts.

COPPER.—According to James Lewis & Sons' January Report on Ores and Metals, 200 tons of California ore to arrive in Liverpool, sold on the 1st at 18s., and good brands of bars on the spot at £93. Stocks of West Coast produce were estimated at 23,441 tons fine against 23,462 tons on the 1st of December. On the reduction of the rate of the Bank of England to five per cent. on the 12th, and advice of the fortnight's charter as only 1,300 tons fine, on the 13th of December, the tone of the market, improved, and the consumptive demand being supplemented by extensive purchases of best select from America, with considerable disinclination on the part of holders to sell, prices have gradually advanced, and as high as £91 10s has been paid for good brands on the spot. Latest quotations are as follows: £91 10s for good brands; £90 to £90 10s for Lota on the spot; with £1 to £2 additional for arrival according to date. 17s 3d for ore, and 17s 6d for Regulus at Swansea; 17s 6d to 18s for Ore and Regulus at Liverpool.

THE CALIFORNIA PLACARD EXCHANGE.—The certificate of incorporation of an advertising company, hearing the above title, has been placed on record the past week. The object of this Association is to collect and hold for exhibition samples of the natural wealth and resources of the State of California, and the coasts and islands of the Pacific Ocean; to collect and supply information concerning the same or other topics; to exhibit and distribute placards, containing business and other announcements, and to conduct a general printing and publishing business. The plan contemplates the daily placard on which will be conspicuously shown every important business notice on record which appears in any paper in the city, of the day, and all other important information, which can be collected by the Association.

MINERS' STRIKE.—Sutter Creek is again the scene of a miners' strike. Last Saturday the miners in the employ of the Lincoln Company were notified that hereafter the night shift would be required to work full time Saturday nights. The custom has been to knock off at midnight, so being dissatisfied with the order, the miners struck and quit work on Monday. About 70 of the strikers asked the men still at work to quit, which some of them refused to do. On Tuesday the strikers reiterated the demand, which led to a dispute, during which several shots were fired and one man was seriously injured.

MINING SUIT.—The Raymond & Ely Mining Company have commenced suit to recover from the Pioche-Phoenix Company, that portion of 525 feet on the Raymond & Ely lode running west from the famous Lightner shaft, which is now held by the Pioche-Phoenix Company. The title to 400 feet of this belongs to the Raymond & Ely Company, as the other company admit, so the suit is really for the remaining 125 feet. This is probably a test case of the Panaca title, which covers a tract two miles long and 1,000 feet wide, including several claims. As the district was abandoned for four years at one time, the opinion of parties interested is that the Panaca title was forfeited by that action.

SAN FRANCISCO BOILER WORKS.—At these works they are just completing a large direct flue and return tubular boiler for the steamer "Pelican." The boiler is 22 feet long, 13 feet in diameter, with a steam chimney 7½ feet in diameter and 7 feet high. It contains 2,800 feet of heating surface. The old boiler of the "Pelican" were not adapted for the fuel used here, and this one was made to replace them. Mr. Curry has just built a boiler for the Willamette Iron Works, Portland, Oregon, and will shortly build another locomotive shape marine boiler. They are now making a dozen mining cars for the Golden State Foundry, and 850 feet of pipe column for mining purposes.

THE INDIAN WAR.—The Modoc Indians, after having been successful in one fight, have this time been repulsed by the troops. Several companies of soldiers are now on the way to Oregon to aid the forces now there. It is supposed that the Indians have been reinforced since their last battle, since they made the attack themselves in this fight, but were repulsed.

THE STOCKTON PAPER MILL is turning out a fair quality of white paper and excellent straw wrapping paper. It is stated by the *Republican* that the company will shortly remove the Santa Cruz mill to Stockton to run in connection with the one now in operation, when they will be able to turn out about five tons per day of newspaper made from straw.

GEOLOGY AND MINERALOGY.—A class in local and mining geology was organized on Tuesday evening last at the Mechanics' Institute by Amos Bowman, of the State Geological Survey. Mr. Henry G. Hanks is also forming a class in determinative mineralogy and use of the blow-pipe, at 649 Clay street.

CORRECTION.—In our last issue in speaking of an improved safety bellows, we stated that the patent safety valve was the only one used. There are two valves, the usual one being placed in the bottom, and the Hendy safety valve is also used, being placed on top to prevent explosions.

UTAH NARROW GAUGE.—At a late meeting of the directors of the Utah Narrow Gauge Railroad Company, it was unanimously resolved to explore the road to Helena, Montana; work on the Corinne branch is to be immediately begun.

RUMOR says that Henry Janin, the mining engineer of diamond-field fame has gone to South America in the interest of capitalists of this city, to report on some mines there.

STORM IN UTAH.—The late severe storms in Utah have had the effect of completely blocking up the roads to the Cottonwood mines much to the inconvenience of the miners.

PERSONAL.—We were favored this week by a call from Mr. L. F. McCarty, corresponding agent of the MINING AND SCIENTIFIC PRESS and the PACIFIC RURAL PRESS. Mr. McCarty is a courteous, affable gentleman, and one of the finest solicitors on the coast. He represents two of the most valuable journals in the State—papers which every farmer and mechanic should subscribe for. (Gilroy Advocate, Jan. 25th.)

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 32-page Circular, containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Government fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

THE office of the SAN FRANCISCO NEWS LETTER, CAL. CHINA MAIL, CAL. MAIL BAG, and other publications issued at the NEWS LETTER office, have been REMOVED to the New and Spacious Building of the CALIFORNIA PLACARD EXCHANGE, Nos. 505 to 515 Merchant street, above Montgomery.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 540 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, \$10 (in coln); in leather, \$12. Forwarded by mail, in cloth, \$11.40, currency; in leather, \$13.75. Issued and for sale by DEWEY & CO., Patent Agents and Publishers Mining and Scientific Press, S. F.

PACIFIC MINERAL LAND OFFICE.—HOTY, SEARS & MCKEE—MERCHANTS' EXCHANGE, CALIFORNIA STREET, SAN FRANCISCO, CAL.—Mining Patents obtained for claims in California, Nevada, Utah, Arizona, and elsewhere. Plans and papers prepared for adverse claimants, as required by the new law; relocations effected where claims have lapsed under the Congressional Act of May 10, 1872; Mining Contests conducted before the Departments and Courts.

Mr. McKee's experience as Chief of the Mining Claims Division, General Land Office, Washington, D. C., will be valuable to parties desiring to properly appear either as claimants for patents or as adverse claimants. Cases attended to in person at any of the District Land Offices, or at the Department at Washington, where deemed necessary. JAS. T. HOTY, W. H. SEARS, C. H. MCKEE. 1725-26m

WONDERFUL CURE.—A young man, a resident of this city, gives us the facts of the following remarkable cure. He says: "I suffered with Catarrh in its worst form. Bones came from my nose; my breath became offensive; I was compelled to eat alone. I had given up all hopes of being cured. At this time met Dr. Evory, of Chicago, who had been cured by a remedy discovered by himself. I tried the remedy, with little faith; but at the end of three months found myself cured." Our informant was now associated himself with the discoverer in the manufacture of the article, which will be found under the name of the Diamond Catarrh Remedy. Price 50 cts.; sent by mail for 50 cts. A. F. EVORY & CO., No. 9 Post street, San Francisco. Sold by all druggists. 25v25-3m

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine.

For the very Best Photographs go to BRADLEY & RULOFSON'S GALLERY, with an "Elevator," 429 Montgomery street, San Francisco. 25v13m-cowpb

And in accordance with law, and an order of the Board of Trustees, made on the 22d day of October, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 509 Sacramento street, San Francisco, California, on the fourteenth day of February, 1873, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

M. J. McMANUS, Secretary pro tem. Office, 609 Sacramento street, San Francisco, Cal. ja25-

Admiral Nelson Tunnel and Mining Com-

pany—Location of works, Emma Hill, Little Cottonwood Mining District, Salt Lake County, Utah Territory. Principal place of business, in the city of San Francisco, Cal. Notice is hereby given that at a meeting of the Board of Directors of said Company, held on the 27th day of January, A. D. 1873, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary of the company, at his office, room No. 1, in the building known as Montgomery Block, on the southeast corner of Montgomery and Washington streets, in the city of San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 8th day of March, A. D. 1873, will be delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 31st day of March, A. D. 1873, to pay the said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

H. SINTON, Secretary. Office, No. 1 Montgomery Block, San Francisco.

Cordillera Gold and Silver Mining Company—Location of property, Morelos Mining District, Chihuahua, Mexico.

The highest price paid for Scrap Iron. 9v143

THE GOODWIN PUMP.

This Pump, which was awarded the PREMIUM at the last State Fair, where a large number of Pumps were exhibited, is the CHEAPEST, MOST EFFICIENT and DURABLE PUMP now manufactured.
We are rapidly increasing our Patterns and extending our facilities for manufacturing, but have not yet been able to fully supply the demand. As our Pump has no valves, it is the best Pump for mines where water containing sand or sediment, or where hot liquids have to be pumped.

It is Unsurpassed for Hydraulic Mining.

And will throw a stream of from two to six hundred inches of water with a force equal to a fall of two hundred and fifty feet. It is peculiarly adapted to windmills for irrigating, or domestic purposes, and is equally as efficient and noiseless at a high or low speed, the water raised being in the ratio of its revolutions. Our large irrigating Pumps will throw twenty thousand gallons per minute.

PUMPS FOR EVERY PURPOSE AND ALL CAPACITIES,

MANUFACTURED BY

GOODWIN & WEST,

No. 235 FIRST STREET, San Francisco (Miner's Foundry).

ALL WORK GUARANTEED.

Send for an Illustrated Circular.

Charles Brown, Dealer in Ranges, Stoves,
Tinware, and all kinds of Kitchen Utensils, Metal Roofing, Tin, Copper, and Sheet-iron work. Chimney Tops put up, and warranted. 724 Market street, S. F.

Sketch of Delaney's New Patent Cushion.

DESCRIPTION OF ENGRAVING.
E, pin or regulator, extending into rail; D, steel wire, tending from pin into and through rubber cushion; B, rubber cushion; C, end of rubber cushion; A, lining.
Their construction is of the simplest kind, thus making no heavy expense for suppositious elaboration. The improvement is a steel wire running lengthwise, and communicating with a pin at each end and inside of the rail; the wire is imbedded in the rubber cushion, near its edge or surface. The pin mentioned is controlled and operated upon by a key, regulating the tension of the wire, according to the necessities of the case. It keeps the edge of the cushion straight and sharp. It prevents the rubber hardening from the impingement of the ball; and, above all other considerations, the angles are bound to be perfectly correct.
The ball never jumps from the table, however severe the stroke. It makes no noise when leaving the cushion.
Nine cushions are made upon our tables with the same degree of force requisite to make six upon any other.
These unrivalled cushions are self-protective, and will retain their elasticity either in hot, cold, dry, or damp weather, almost forever.
Thousands of Delaney's cushions have been introduced throughout California and the Great West, where the largest billiard manufacturers now make exclusive use of them, to the eminent satisfaction of their patrons.
Sole Agents for the Pacific States, China, Japan, Sandwich Islands, and Australia.

EXCELSIOR MINING PUMP.

NO. 2-MOUNTED.

NO. 3-SHIP.

NO. 5-MINING.

With six years use of this Pump we confidently recommend its

Use for Mining or Prospecting.

It is the **CHEAPEST** Pump in the market.

There is **NO** Trade Pump made of equal strength and power.

Every Pump is tested by hydraulic power to 125 lbs. to the square inch. So every Pump, large or small, is

WARRANTED

To Force Water 250 Feet High.

VALVE.

ALL PUMPS WARRANTED. All Expense of Transportation Refunded if the Pumps are Proved Defective.

Send for Circular.

Brittan, Holbrook & Co.,

111 and 113 California street, San Francisco, (and also Sacramento), General Agents.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.

IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN—My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freshburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While others require but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,

Little Cottonwood, Utah.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for this Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

EMMA HILL CONSOLIDATED MINING CO.,

Superintendent's Office, Oct. 23, 1872.

T. M. MARTIN, Esq.—Sir: With pleasure I refer to the fact that the endless wire Ropeway (HALLIDIE'S PATENT) built by you for this Company, has been for a month or more in daily operation, and that it is in a most admirable manner, the machinery works smoothly and the cable is completely under the control of the brakes, man. In fine, the work in its operations is a success. Respec fully yours,

WM. C. CAMPBELL, Clerk of Co.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,500 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 60 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,

112 and 114 California Street, San Francisco.

Wire Rope for hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates.

A. S. HALLIDIE, 112 and 114 California St.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

SAN FRANCISCO, SATURDAY, FEBRUARY 8, 1873.

VOLUME XXVI.
Number 6.

The Chicago Taylor Printing Press Company.

The accompanying cut is a very good representation of the new and very superior steam printing machine we have recently put in operation in our printing establishment, and upon which all our issues will hereafter be printed. The improved appearance of our paper already accomplished speaks very plainly in favor of the superiority of this machine over all others now built in this country, and when it is better understood by those who operate it, and gets down to its bearings and work, this improvement will be more and more marked until we can give our readers a sheet which in mechanical execution is the peer of the best similar publication at the East.

As this is the first introduction here of this class of presses, made especially for extra fine engraving work, and our readers are to examine its work weekly, we take the privilege of indulging in a long talk concerning the machine and its builders. Every printer will be entirely interested in it, and the general reading public, we believe, benefitted by the facts we propose to set forth.

The heavy cost attending the purchase and starting such a machine as this is an important matter, and the absolute necessity having arisen of our procuring a machine of our own on which to print our own papers, made it necessary for us to examine into the merits of the various manufactures of printing presses at the East. After canvassing the matter very thoroughly, and consulting parties whose opinions in this particular is good evidence, and seeing other machines from the Chicago Taylor Printing Press Co., running in this city, we were forced to the conclusion that in all points of excellence this machine was not only the great favorite all over the Northwest and in the Territories, but indeed the best printing machine now built in this country.

In October last, the President of the Company, S. P. Rounds, Esq., of Chicago, visited this city and learning that we were on the point of putting up a new press volunteered to take the risk of sending a machine here—putting it up in our office, and guaranteeing it to operate to our entire satisfaction or no sale—and considering the heavy expense of the machine, the freight on it overland, and cost of putting it in operation, the heavy risk assumed by him at least proved his confidence in the press; and we are much pleased to add that he has not only fulfilled his contract to the letter, but that the machine operates even better than the guarantee, and that we are in every particular pleased with our choice and the purchase.

History of Press Building.

The history of the commencement and progress of the manufacture of the printing press in this country is a very interesting one, and had we the time and space to spare, would be pleased to give it in full, but as we have not, we will give only a brief synopsis. The first effort in this line was the "Ramago" two-pull band press, which was the only press in use up to about the year 1820, when the Stanhope press, invented by the Earl Stanhope, in England, was introduced into this country. This was soon followed by the "Ruthven," which had some improvements. In 1823 the first iron one-pull

EXPLANATIONS.—The pile of sheets to be printed will be seen on top of the press. They are fed down singly so as to be caught by the row of rollers shown across the upper and front portion of the large drum cylinder, the revolution of which carries the papers down to the flat type forms which latter pass horizontally back and forth on the bed of the press. The cylinder is adjusted so as to press the sheets sufficiently hard against the face of the types to take the impression of every letter. The forms are carried at each revolution so as to pass under the first set of inking rollers, seen just at the right of the drum cylinder. The ink is taken from the fountain at the extreme right of the engraving, and distributed evenly by the system of rollers arranged diagonally to each other, by the passage back and forth of a distributing plate. The sheets are delivered on the table at the left by the tapes and the fingers of the "fly," represented between the cylinder and the delivery table; 1,000 to 1,500 sheets per hour are printed on our press

press made by Wells, of Hartford, Conn., was brought out. At about the same time the "Smith" press, and shortly after the "Washington" press was brought out by R. Hoe & Co., of New York, and which press made both by Hoe and Taylor is the standard band press of to-day.

Up to 1820, no successful attempt had been made in perfecting a power press. In 1824 a Mr. Treadwell invented one, but it was imperfect. After a trip to Europe, and many experiments, the press was made to operate very well but was a crude affair. Sometime in 1824-5, the first "cylinder" or "Napier" press was imported from England for the joint use of the New York Daily American and the New York Daily Advertiser, the first an evening, and the latter a morning paper. Shortly after this Messrs. R. Hoe & Co., commenced the manufacture of cylinder presses in this country, which they have continued, father and sons to the present day—being jointly with A. B. Taylor, Esq., of New York, the "fathers" of the cylinder press in this country. We should have said that about this time the later justly celebrated

the very first, and at once took a leading rank in the press building interest.

The machines built by the new firm gave the most splendid satisfaction from the first, and in the short space of five years they have built hundreds of them, which from the best information we can gather, are every one giving the most hearty satisfaction, and running in the best offices in the Northwest, portions of the South and East, Colorado, Utah, Nevada, Oregon, and in our own city and State.

In 1869, just as the reputation and success of the new enterprise was triumphantly established, and his name and fame "written in letters of steel" in almost every office in the great West, Mr. Taylor died, but not until he had left well-educated successors to carry out his ideas and improvements. The business at this period was put into a company called the

"The Chicago Taylor Press Company,"

With the remaining partner as its President and head,

CHICAGO TAYLOR COMBINATION PRESS.

Adams' Book press was invented by Isaac Adams of Boston. At first it had a wooden frame and was a cumbersome and rather uncouth affair, very unlike the handsome and finely built machine of to-day.

At the time Messrs. R. Hoe & Co. began building the cylinder press, A. R. Taylor, Esq., of New York, was their foreman, and really constructed the first cylinder press ever made in this country. He continued in their employ for a term of years, when he started a manufactory for himself, and invented and added to the press then built by Hoe, many improvements, among them the celebrated air springs—a very desirable feature which has from that day to the present made the press a very popular one—so that the "Taylor" press is as well known to printers as its cotemporary, the "Hoe" and is in use in almost every large office from the Atlantic to the Pacific, very many of them having been in use from the early days of our own city to the present, in many of our city offices.

For some twelve years previous to 1867, Mr. Taylor's eldest son, George W. Taylor, who had received a thorough education in the best schools in this country and Europe, and a thorough mechanical one in his father's shops, and in them had acted as Superintendent and Draughtsman; falling in health from the raw sea winds, he conceived the idea of establishing a new manufactory of the Taylor press in Chicago. Accordingly in that year he moved thither and associated himself with S. P. Rounds, who had for twenty years transacted a general Printer's Furnishing Business in that city, and was well and widely known by the printing fraternity of the great North West.

George W. Taylor, was doubtless the most thoroughly accomplished Printing Press machinist and inventor this country ever saw. Young, ambitious, keenly alive to the necessity of keeping pace with the times in all improvements—listening to the suggestions of practical pressmen—and knowing full well the vital necessity of making an article which should combine all the excellence, improvements, and conveniences possible to attain, he at once made an entire new set of drawings and patterns—retaining all the excellencies of the old machine, and adding numerous new ones—aided by new and improved machinery, and also by the favorable acquaintance and practical business experience of his partner, the new firm met with the most flattering success from

and to whose great experience as a practical printer and pressman, dealer in printers' material and manufacturer of the presses, is the company indebted for its constant and unvarying success. A new and very large brick manufactory was erected—an entirely new and elegant and very extensive and expensive series of machinery put in operation, and the popularity and excellence of their machine is evidenced by the fact, that they have never as yet been able to keep up square with its orders, though often running double sets of hands, night and day, and we had to wait nearly three months before we could get our press built. However, we are assured by the President that by recent additions of men and machinery he hopes soon to be able to keep one press of each size and style on hand with which to meet urgent orders. The company is now building

Three Different Styles of Presses

And different sizes of each style. First, there is the so-called "Country" Drum Cylinder—a machine combining all the real excellencies of the more costly press, but not built so heavy or with as fine a finish, and made to run at a slower speed—say 1,000 to 1,500 per hour, by steam, and 800 to 1,000 hand—and afforded at a figure to meet the necessities of the "country" publisher, who cannot afford and does not require a faster press. No. 1, is 32x46 inches between bearers and is afforded at \$1,474, boxed and delivered on cars, and No. 2, 32x50 inches, at \$1,705, steam fixtures \$70 extra. This style of press is in general use in all the well-to-do offices in the Northwest and in Colorado, Utah, Nevada, Oregon, and in Napa, Santa Barbara and other places in this State. Next comes the "Combination," their

New and Latest Style,

And in cost between their "Country" and "Regular." This is the machine represented both in our office and in the accompanying engraving.

This press combines all the best features of the two other styles—has the combined rack and screw and table distribution—making it absolutely perfect, doing away with the intermediate wheel and universal joint—those prolific sources of wear, lost motion and imperfect register, taking the power direct from the cylinder wheel to the rack below—thus ensuring absolutely perfect register. It has the new "well" fountain, the new and positive "gripper" motion, patent feed

guides and "grasshoppers," and is built very simply, strongly and perfectly. Having the closest register of any press now built, the most thorough ink distribution, and three and four inking rollers, with right and left vibrators on the top of these and eight rollers on the table. This machine is peculiarly adapted to all kind of plain and colored letter press work,

Illustrated Newspaper,

And the very finest description of book work. It is so strongly built—having the celebrated "air springs"—and withal so very simple it can be run at a high rate of speed. Of this kind of press there are now three sizes built. The one we have in use is the largest, bed 34x53 inches between bearers, and costing boxed and delivered on the cars at manufactory at Chicago, all complete, with counting machine attached, \$3,010. Next comes the three roller "Double Medium," bed 25x38 inches between bearers, the handiest and best combined book and job press made, as it will print any and everything, from a common bill head to a book form of 16 pages; price, on cars, \$2,370. Third and last, the three roller "Super Royal," same style, bed 21x33 and price \$2,030.

Then follows the "Regular" fast first-class drum cylinder. This press is built very heavy and strong and finished in the highest style. It is intended more particularly for very heavy and fast work, such as railroad and fine colored printing. Its distribution, register, and general points, are the same as in the press we have in use, but the frame is made extremely heavy, four very heavy cross stays and otherwise built in proportion. Of this style the company is at present building four sizes: Medium, 23x28; Super Royal, 25x33; Double Medium, 29x42; and Double Super Royal, 34x53; the prices ranging about one-third higher than for the "Combination."

The company also builds Double Cylinders, of all sizes of the well-known "Taylor," "Washington" hand presses, proof presses, paper cutters, etc., and are prepared to make drawings and patterns for any desired size of either of their drum cylinders.

This company being emphatically the Western Pioneers in the manufacture of printing presses—and having, by dint of western pluck, hard work, and conscientious dealing already secured a splendid reputation and standing—and having so fully and honorably fulfilled its contract with us, our sympathies are entirely in its favor, and we will take

pride and pleasure in showing any purchaser or publisher on the Pacific Coast our beautiful machine in operation. The company have a just claim on the patronage of all western printers, and as long as it deserves, should have it.

It is perhaps due to our enterprising and well known fellow citizen, Geo. L. Faulkner, Esq., of the California Type foundry, 405 and 407 Sansome St., to state that our attention was first called to this machine by him—and that he is taking an active part in introducing it on the Coast, as agent, and in connection with his extensive Printers' Furnishing and Type Foundry Business, and he will take pleasure in answering all inquiries in regard thereto—sending the company's elegant book, the "Pressman's" Guide and "Press Catalogue" to all applicants, or showing the different kinds of the presses now in operation in this city.

Messrs. H. S. Crocker & Co., Messrs. Carr, Dunn & Newhoff, and Messrs. Winterhurn & Co. already have them in use, and other parties are about putting them in. Mr. F. has also recently sent them to Portland and Salem, Oregon, Carson City, Nevada, Napa and Santa Barbara in our own State, and already has and will keep both sizes of the "Country" drum cylinder on exhibition in his foundry. We also understand that Messrs. Painter & Co., the old and reliable type foundries are also acting as agents for these machines, and are also prepared to fill all orders promptly.

Finally, when it is considered that freights are about the same from Chicago overland on these machines, as by the Isthmus route from New York, and a great deal of time is saved, and that in case of breakage by accident or otherwise (all the parts being made interchangeable and kept on hand at the manufactory) the expense and delay is comparatively trifling—we think every member of our craft has cause to feel pleased at the advent of the "Chicago Taylor Printing Press."

CORRESPONDENCE.

Case-Hardening.

Written for the Press.

It is a very obvious fact, that a hard-working surface will last very much longer than a soft one, besides doing away to a very great extent, with the likelihood of the two surfaces cutting or ceizing—that bugbear of all engineers. I have seen the slide-valves and valve-seats of locomotive engines so soft, that face them down ever so true, before they had run for a month, the seat would be worn an eighth of an inch hollow, and the valve correspondingly round, on the surface, thus destroying very materially the working power of the engine, as it would be impossible in such a case for the engine either to receive, cut off, or emit her steam with the precision that is required. The valve motion, too, may be closed, all lost motion taken out of pins, pin-holes, etc., but the metal being soft, or merely smeared over with potash, will, before the engine has made many trips, give so much end wear away so quickly, that it looks like a useless expenditure of labor either to repair or make machinery and send it out to work in that style. How, then, is it to be avoided; what shall be done to remedy the evil?

As far as cast-iron is concerned, of course nothing can be done toward making that harder than it naturally is; but there is a process by which wrought iron can be made so extremely hard as to equal hardened steel—that process is case-hardening. I have been surprised to find this so much neglected both in the Eastern States and on the Pacific Slope. The process is so simple, and can be done with so little expense that, considering the immense advantages to be gained, it has been a wonder to me why there was not a case-hardening furnace put up at all machine shops. I have assisted at case-hardening in Europe and also in this country, and for the benefit of mechanics and the trade generally, I will give, in as clear a way as I can, the result of my observation and experience.

A furnace should be constructed of stone, well cemented together, walls not less than one foot in thickness; the size of furnace, of course, would be made to suit the quantity of work each shop had to do. Iron rods and stays should be worked in with the masonry across the furnace on which to lay the box, directly underneath being the fire space, the grate of which should stand one foot from the ground, so as to allow a good draft underneath and also room for the ashes to fall. If not convenient to build a brick or stone chimney, stovepipe will answer the purpose.

The box should be made large enough to hold the different-sized pieces of metal to be hardened; but it is better to have two boxes, rather than one too large and unwieldy to manage; as in that case trouble is likely to arise in getting the box out of the furnace, it being so extremely hot that it is impossible to handle it except with very long tongs, rakes, etc. The box should be made of $\frac{1}{4}$ inch sheet iron, well riveted together with angle iron.

The material used to mix in with the work consists of bones burned to a charcoal, with leather shavings, burned or not burned—it does equally as well. Indeed, in some shops neither the bones nor the leather is burned at all; but cut or mashed up very fine. This is mixed with charcoal and distributed carefully among the work to be hardened. If a piece of metal is of any considerable length, care should be taken to pack it well, for if it should rest only on its two ends it would surely get sprung in the middle, and vice versa. Lay the work carefully among the prepared stuff—one layer of stuff on the bottom of the box, then as much metal as can conveniently be laid down without letting the pieces touch each other; another layer of charcoal, etc., on the top of that, seeing that all the various holes in the work are well filled; then more work, and so on till the box is full. When fastening down the lid, it is ready for the furnace.

When the door of the furnace is closed, unless it fits very close, put some fine clay all round so as to effectually exclude all cold drafts that otherwise pass through the furnace. Some men should be detailed to attend to the furnace, and keep up a good fire, day and night, so that the box is kept at a dull red heat all the time. The time for keeping it in the furnace is generally twenty-four hours. At the expiration of that time the box should be drawn, and cold water having been previously prepared close by, it being kept cold by a continuous stream from hose or otherwise, the various pieces of work are picked out and as expeditiously as possible dropped into the water.

Let me say, here, that though it should be taken from the box as quickly as possible, to prevent the work from sealing, yet it should be done with the greatest coolness. I have seen men with their pokers and tongs dab into the red hot mass to wrench up from the bottom the pieces that lay there, either through excitement or ignorance, forgetting that as the work is red hot, the smallest blow will raise a nasty burr, which may prove troublesome to get off afterward. A small burr raised on the edge of, or in a hole that has to work, has occasioned the necessity of softening to get it out, as it is

impossible to touch work so hardened with a file of any description.

If the furnace has been attended to properly the work will now have a surface ranging from 1-32 to 1-16 of an inch in thickness, so hard that nothing but the grindstone or emery will be able to effect it, in making the various parts work together freely. A high and durable polish can now be put on by rubbing with emery cloth, and if the work has been carefully filed up, while in a soft state, it will look very nice indeed; but if, on the contrary, it has been filed too hastily or too carelessly, and deep scratches left, it will be impossible to polish it up, as the scratch will have widened and got black, defying the power of the polisher to make it anything else, but a deep, ugly scratch. The filing up work to be hardened, and leaving deep marks and putting on a high polish, to hide them for the time being after they come from the furnace, is very objectionable; it looks detestable to a practical mechanic. Only wrought iron can be subjected to this process. Cast iron is simply made more brittle.

A master mechanic that I was once working for, desired me to put in the box a piece of cast iron to test the effect, stating that he thought if the hardening process was good for wrought iron, it must be equally good for cast iron. I did as I was desired, and after all was cooled off I took the piece of cast iron and snapped it in two with my fingers.

If rank pins are required to be hardened, the plain part that goes in the wheel should be well wrapped up with clay, so as to prevent as much as possible the absorption of carbon by the metal, and when cooled, they should be put in a trough with water deep enough to cover the working part, the other being made to stand above the water.

MECHANIC.

Carlin, January, 1873.

Coal for Domestic Use in San Francisco.

What Kinds are Used in San Francisco—Where They Come From—Quantity, Quality, Etc.

Nearly all the coal used for domestic purposes in California is mined on the Pacific slope. West Hartley is used to some extent, but most of that sold by retailers for West Hartley is either mixed or entirely of some other kind. There is no true coal found west of the Rocky Mountains, with the exception of some veins on Vancouver Island, and possibly in some other portion of British Columbia. The coal veins of California and Washington Territory are of later geological formation than the anthracite beds of Pennsylvania and other Eastern States. The Pacific coast production is a species of lignite, not properly coal. Anthracite, sometimes called stone coal, is hard, black coal, does not soil the fingers when touched, fracture conchoidal, decrepitate in burning, kindles with difficulty, contains a very large proportion of carbon, very little oxygen, hydrogen, and nitrogen. Bituminous, or soft coal, varies much in color, weight and quality. Some species have a luster more waxy than that of anthracite, fracture uneven, often divided by joints into parallel; from 73 to 90 per cent. carbon, and from 8 to 22 per cent. oxygen, hydrogen and nitrogen, with considerable earthy matter and ash. The term "Bitumen" as applied to coal does not mean that it contains mineral pitch, but that oxygen, hydrogen and nitrogen give it a more inflammable character. The bituminous coals are divided into sorts according to their burning properties, such as "free burning," "smokeless," "non-eking," etc. The caking coals are those which tend to partially fuse while burning, emitting smoke and jets of gas. A single seam of coal sometimes contains layers of various quality.

Mount Diablo Coal.

The shipments of coal from the Mount Diablo mines are larger than those of any other mine on the coast, amounting to about 180,000 per annum. The coal is used mainly for the generation of steam. It is consumed in steamers, mills, and manufacturing establishments. Some years ago, before the miners had penetrated to any great depth, the coal contained considerable sulphur, which emitted an unpleasant odor while burning, and injured the reputation of the coal for domestic use. Since the opening of the Black Diamond, Union and Independent veins, the quality has improved, and although little is openly sold for domestic use, it is often disposed of under other names, and the housewife does not know that she is burning that "nasty sulphur stuff." The miners are now working in solid coal, of good quality. About twenty per cent. of this coal reaches the market in the form of screenings, which is sold at a lower price than the lump coal. In order to burn it without waste, furnaces are constructed with bare set close. It is the lowest-priced coal in the market, bringing, by the cargo, about \$6 per ton.

Although Diablo coal is much used on steamers, it is not taken on long voyages, the reason for which, it has been said, is its liability to spontaneous combustion. This the owners of the mine deny, saying it is no more liable to spontaneous combustion than is Cumberland coal, which is used extensively on ocean steam-

ers. The Pacific Mail Company have arrangements for supplies of coal at prices less than can be produced here, excepting possibly, the screenings of the Mount Diablo coal, which is not suitable for the use of ocean steamers. An experiment recently made by Allen Wilcox, at his works, No. 21 Front street, showed very little difference between the relative value of Mount Diablo coal and Oregon pine for generating steam to drive a water-lifter. He ascertained that one ton of good screenings, costing \$7 per ton, will raise 432,000 gallons thirty-five feet, equal to one and two-third cents for each 1,000 gallons. One cord at \$8 per cord, will raise 456,000 gallons thirty-five feet high, at the rate of one and three-fourth cents for each 1,000 gallons. Reckoning wood at \$5 per cord, each 1,000 gallons will cost one cent and one mill.

Bellingham Bay Coal.

The Bellingham Bay coal is used almost exclusively for domestic purposes, although it leaves a large quantity of ashes, and therefore makes considerable dust in the hearth or grate. It is a free-burning brown coal, with slaty cleavage and brilliant conchoidal fracture. Any person familiar with it can recognize it at a glance. The mine is on the eastern shore of Bellingham Bay, in Washington Territory, and is more favorably located for shipping purposes than any other on the coast, being at the very shore of the Bay, where it can be taken on hoard vessels at little expense. The property includes 1,641 acres of timberland. There is a good wharf at the mouth of the pit, where vessels are loaded. The deposits are very extensive. It is similarly to the Seattle coal in quality, and the latter has sometimes been sold for Bellingham Bay to persons who had become used to burning it, and desired that particular kind. It is a fact that people form attachments for certain kinds of coal. Often more in accordance with their prejudices than from any good, clear judgment, and they persist in having coal called by that name even at a higher price than they would have to pay for the same article under a different name. Some dealers sell Coos Bay, Seattle, Bellingham Bay and Rocky Mountain all from the same heap, which is very likely to be from Mount Diablo, the very name of which smacks of the evil one, to say nothing of the sulphur, which purchasers would be sure to smell if they only knew where it came from. The fact is, the lower strata of Mount Diablo coal is as free from sulphur as other coals of better reputation. The Bellingham Bay Company has been unfortunate during the last four or five years, the mine having been several times on fire, and also flooded with water. It is now in working order again, and is shipping 3,000 tons per month, with a prospect of speedily increasing the amount to 10,000 tons per month. The company own their own vessels—the ships *Lookout* and *Germania*, of about 1,500 tons carrying capacity each, and the bark *Amethyst*, of 500 tons. The stock is mostly owned in San Francisco.

Coos Bay Coal.

The Eastport Coos Bay coal mine is situated near Coos Bay, State of Oregon; the land belonging to the company (consisting of 1,600 acres) is nearly all underlaid by a coal deposit. The distance from the wharf to the mouth of the mine is three-fourths of a mile, and the loaded cars descend to the water's edge over a railroad of easy grade, by force of gravity, and are returned to the mines by mules. The coal is taken from the wharf as received, without screening. It is a clear, black coal, with lustrous conchoidal fracture, free from iron pyrites, no trace of sulphur, leaves comparatively little ash, and burns without any disagreeable odor. It is not so easily kindled as Seattle or Bellingham Bay, is less inflammable than Rocky Mountain coal, cakes somewhat in burning, and gives out considerable gas, which is consumed in puffs, without odor. The coal of the Newport Coos Bay Company is of the same general character. The cost of the coal delivered in San Francisco was formerly about \$7 per ton. The Eastport Company, by the construction of a tug boat and other facilities, have reduced somewhat the expense of reaching market. By aid of the tug they are enabled to cross the bar with less hindrance than formerly. The use of this coal, as well as the Seattle, has been very greatly increased by the suspension of work in the Bellingham Bay mines. Although the cost is less than formerly, the price is higher, being about \$12 per ton by the cargo. The Eastport Company sold 20,000 tons last year, lying one month idle, on account of a strike of the workmen. The Directors have declared a regular monthly dividend of one per cent. on the capital stock.

Seattle Coal.

The Seattle is an excellent quality of lignite, not properly coal. It burns freely, makes a cheerful fire in a grate, and answers well for cooking purposes, lighting more easily than most other kinds, and can be used where there is less draft than is required for Coos Bay coal. The Seattle mine is seventeen miles from the town of Seattle, Washington Territory. From the mine to the lake is four miles, over which the coal is shipped by narrow-gauge railroad. The coal is conveyed from the mine to vessels lying in port at Seattle without emptying the cars until the coal arrives at the vessel's side. The Company takes out an average of eighty tons per day; employ about 120 men, two steam tugs, two large barges, one steam engine, 40 horses and 160 two-ton cars. In 1871, 15,000 tons were shipped, two-thirds of which came to San Francisco. In 1872 they took out 35,000 tons, of which 25,000 were brought to this port. It brings \$12.50 per ton by the

cargo. The expenses are about as follows: \$3.50 per ton to mine it and put it in ships at Seattle; \$5 per ton for freight, leaving a net profit of \$4 per ton, or 30 per cent. The owners of the stock are residents of San Francisco and New York city. The demand for the coal is steadily increasing. If the Company owned ships in which to bring their coal to market, they could sell for a lower price and make more money.

Experiments With Coal.

Two years ago a series of very careful experiments were made with various kinds of coal by Chief Engineer Isherwood, at Mare Island, in order to ascertain the steam-generating power of the coal, the comparative quantity of combustible material in each, the rate of combustion, etc. His official report has not yet been published, but the following are some of the results ascertained. We select only those coals which are used to a great extent in this market, being the brown coal from Australia, Vancouver's Island and Washington Territory, and the lignite from Oregon, California and Wyoming. [No experiments were made with the Seattle coal, for which there is much demand here:]

	Coos Bay	Mount Diablo	Bellingham Bay	Nanaimo	Sydney	Rocky Mountain
Lbs. coal consumed in 24 hours	8,602	8,021	10,225	7,486	11,040	9,860
Lbs. ashes and clinker from the coal	696	991	2,507	934	1,552	1,641
Per cent. of the coal ashes and clinker	8.09	12.36	24.52	12.43	14.06	16.63
Lbs. of coal consumed per hour	358	334	426	311	460	411
Lbs. water vaporized from 1 lb. of coal	7,042	5,326	3,995	4,384	3,782	4,535

If a test of this kind were made at the present time the result would be more favorable for the Coos Bay and the Diablo coals, than is given above, for the reason that a better quality of coal has been obtained by deeper excavations. From this experiment, as well as by other tests applied, it is evident that certain varieties of coal sold in this market are not properly classified. A greater price is demanded than the ascertained quality of the coal justifies.

Experiments have also been made at Mare Island with a view to determine the number of pounds of coal required as an equivalent for one cord of the best live oak wood obtainable in this market, the result being as follows:

Nanaimo, Vancouver Island, B. C.	1,800
Bellingham Bay, Washington Territory	2,200
Seattle, Washington Territory	2,400
Rocky Mountain, Utah	2,500
Mount Diablo, California	2,600
Coos Bay, Oregon	2,600

The present retail prices of coal per ton in this market are as follows:

Sydney; \$17; Nanaimo, \$16; Bellingham Bay, \$15; Mount Diablo, \$12; Coos Bay, \$15; Rocky Mountain, \$16; Seattle \$16.
--

The entire amount of coal production and importation during the last year was not far from 500,000 tons, of which 180,000 tons were from Mount Diablo; about 115,000 were from Sydney; and 26,000 from Nanaimo, Vancouver Island—a kind of coal used principally in making gas; a small quantity of Chilean coal was received, amounting to say 3,000 tons, and about 29,000 tons of English coal. The importations will undoubtedly continue to decrease, until none is received from abroad except as ballast. The home production will in a few years fully supply the demand. New discoveries are being made of deposits within easy reach of market, and should the quality of the coal prove as good as that already developed the price of coal must eventually decrease.—*Bulletin*.

Professor Agassiz on the Negro.

In a recent lecture Agassiz remarked: "I have pointed out over a hundred specific differences between the bone and nervous systems of the white man and the negro. Indeed, their frames are alike in no particular. There is no bone in the negro's body which is relatively the same shape, size, articulation, or chemically of the same composition as that of the white man. The negro's bones contain a far greater proportion of calcareous salts than those of the white man. Even the negro's blood is chemically a very different fluid from that which courses in the veins of the white man. The whole physical organization of the negro differs quite as much from the white man's as it does from that of the chimpanzee—that is in his bones, muscles, nerves and fibres, the chimpanzee has not much farther to progress to become a white man. This fact science inexorably demonstrates.

"Climate has no more to do with the difference between the white man and the negro than it has with that between the negro and the chimpanzee, or it has between the horse and the ass, or the eagle and the owl. Each is a distinct and separate creation. The negro and the white man were created as specifically different as the owl and the eagle. They were designed to fill different places in the system of nature. The negro is no more a negro by accident or misfortune than the owl is the kind of a bird he is by accident or misfortune. The negro is no more the white man's brother than the owl is the sister of the eagle, or the ass the brother of the horse. How stupendous, and yet how simple, is the doctrine that the Almighty maker of the universe has created different species of men, just as he has different species of the lower animals, to fill different places and offices in the grand machinery of nature."

MECHANICAL PROGRESS.

Rolling Molten Steel.

The *Engineer* figures and describes a very ingenious device recently invented by Mr. James Robertson, of Glasgow, for treating and shaping metals as they are poured, in a molten state, from a Bessemer converter or other vessel. The fluid mass is received between a set of rolls so placed as to retain the liquid metal until it becomes chilled sufficiently to be handled. The rolls, at the receiving end, are conically shaped so that the iron is gradually compressed and a delivering action set up in the mass of iron as it passes between and longitudinally along the face of the rolls.

The invention has not yet been put to a practical test, but much confidence is expressed that it will succeed. The greatest difficulty apprehended is in keeping the rolls at a temperature sufficiently low to prevent their becoming warped by heat or pressure, when working in direct and continued contact with a mass of metal at a temperature about 2,000°. The inventor proposes arrangements for cooling the rolls internally, and for subjecting them to sprays or jets of water externally, on parts opposite to those in actual contact with the molten metal.

This difficulty overcome, there will be no hindrance to the production of steel bars practically of unlimited length, directly from the converting vessel, and therefore at a great saving of reheating for subsequent rolling. The *Engineer* expresses much confidence in the success of the invention—a fact which, if accomplished, must have in its different bearings no small influence on steel manufacture, and one well worth the attention of constructing engineers everywhere.

LIME AND MORTAR.—The main results of certain recent experiments made to obtain accurate information on the process of the hardening of lime and mortar, as applied for ordinary building purposes, are that the freshly-applied mortar gives off, at first, water only, by which process the particles of lime begin to adhere together; afterward carbonic acid begins to be absorbed, and thereby the solidity of the mass is increased. The last stage of the drying of the mortar coincides with that of saturation of the lime with carbonic acid, and this process causes the fixation of the porous bricks with the mortar. The absorption of carbonic acid alone, without previous dehydration, never causes ordinary mortar to become hard. Freshly-made mortar exposed to an atmosphere of moist carbonic acid remains soft; while mortar placed under a bell-jar filled with carbonic acid, and standing over a basin filled with strong sulphuric acid, (which rapidly absorbs water,) becomes rapidly hard. Large quantities of mortar, especially with limited exposure to air, take months, or even years, to harden.

TOOLS VS. HANDS.—The late labor troubles and the advancing price of coal in England is operating as a spur to employers to devise ways and means to do the same work with less hands and less skilled labor. Tool makers are consequently reaping a rich harvest in the increased demand for tools of all kinds. Constant efforts are also being directed to devising new appliances as substitutes for human hands. It is thought that the current of engineering thought, for the coming year, will be more than ever turned to the invention of special machine tools. Cheap motive power is also a great desideratum, and is commanding an unusual amount of attention from constructing engineers. Improved engines for economizing power are also in great demand; especially is this the case for marine use, where compound engines are in great demand. Much the same results are also observed in this country, and there is no doubt but that inventors and their devices will attract more attention within the next year or two than ever before.

A NEW CRUSHING MACHINE.—A crushing machine of (as claimed) great effectiveness, has been constructed by M. Jannot, a French engineer. It consists of a wheel on a horizontal axle revolving around a vertical arbor, which receives its rotary motion by means of spur gearing. In its circular motion the wheel runs in the bottom of an annular trough with an open bar bottom containing the material to be crushed. When crushed the material immediately falls between the bars into a screen of conical form, which is divided into two parts, the fine parts passing through, the others being collected and placed in the trough.

STRAIGHTENING A CHIMNEY.—A chimney 208 feet high, belonging to the Lawrence Mills, at Lowell, Mass., was lately found to have been thrown fifteen inches from the perpendicular by a high wind and continuous rains. The leaning, however, was found not to begin until a height of about 100 feet had been reached, the lower portion being still upright. The remedy employed was, to saw the mortar between the bricks, by which method the inclination was corrected at the rate of three inches in twenty-four hours and the chimney was thus gradually restored to its proper position.

The manufacture of iron rails in the United States has doubled within the last ten years.

TEMPERING STEEL.—Since, in tempering steel, the colors owe their appearance to the formation of an exceedingly thin superficial skin of oxide, it is evident that the steel, when withdrawn from the fire, does not retain its first color, but there appear other colors in consequence of a subsequent oxidation by the air, until the steel is sufficiently cool. Of a certain color, one can only judge with certainty by examining the conditions under which it occurs. If two pieces of steel are heated until the yellow color appears, and if one is withdrawn, it may become in the air purple, violet, and finally blue, while the other piece assumes the same colors in the fire. However, if both pieces when blue are dipped into water, they assume different degrees of hardness, i. e., the one which turned blue in the air will be harder than the one left in the fire. Hence, it follows that proper caution must be observed in this respect, and steel must either be cooled rapidly, when the right color appears in the fire, or it must be withdrawn at a preceding color, if the color is to appear by after annealing. Sometimes it is intended by the process of annealing to give to articles an attractive appearance, and at the same time to prevent them from rusting by the formation of a layer of oxide. In such a case, uniform quality and heating is required.—*Storet.*

THE DANK'S FURNACE.—Mr. Danks was present at the late meeting of the National Association of Iron Manufacturers, at Philadelphia, and his introduction and remarks formed the feature of one of the evenings. Mr. Danks gave his experience with the iron trade of England, and said that in spite of the efforts of interested parties, he had successfully introduced the furnace throughout England and in Scotland, while in France, Belgium, Austria, Sweden and Norway, furnaces upon his system were being erected. Mr. Danks fully described the construction and working of his furnace to the meeting after which he was submitted to a long series of questions, to which he responded freely.

Much valuable information, not heretofore published, was elicited, and Mr. D. was elected an honorary member of the association, "in view of the eminent services rendered by him to the iron manufacturers of the United States by his inventions and successful efforts in the line of mechanical puddling."

THE PRODUCTION OF MANGANESE.—There appears to be dawning upon us the possibility of reducing manganese on a metallurgical scale from its ores. It is somewhat remarkable that a metal which possesses such peculiar and valuable properties should have so long resisted the attacks that have been made upon it. We really know very little about it, and it is only recently that its reduction from its ores has been accomplished in any quantity. It is generally stated in the books that is necessary to keep metallic manganese either hermetically or inclosed in nephtha. If we had never seen iron in larger fragments than a hazel nut we should be apt to come to the same conclusion. It was only when iron was worked by the ton that we were led to know its properties. When we have manganese in equal quantities we may discover that it can also be safely left outdoors, if protected by paint, and we shall doubtless find its alloys of great value in the arts.

SAILS VS. STEAM.—Few are aware of the great revolution that is going on in England in the way of substituting steam for sails under the foggy skies in the narrow channels and in the stormy climate of Northern Europe. The steamers have advantages over sailing vessels so great that the latter will be excluded from all the larger classes of business. In the last six years, the annual tonnage constructed, of sailers, has fallen nearly seventy per cent., while that of steamers has increased seventy per cent. Whether the steady breeze and the placid waters of the Pacific are to become the monopoly of the steamers is still to be determined.

PECULIAR BOILER DEPOSIT STEAM-SPACE.—E. Mateczek relates a peculiar formation of boiler deposit in the space not filled with water, but with steam. The sp. gr. of this material was found to be 1.383, and its chemical composition, in 100 parts, as follows: Water, 2.831; fatty matter, 1.430; organic matter, 21.995; silica, 21.713; sulphuric acid, 6.947; chlorine, 0.136; oxide of iron, 3.836; phosphoric acid and alumina, 7.878; lime, 15.752; magnesia, 4.151; sand and clay, 12.283. The water used as feed-water for this boiler was taken from the river Elbe, but the large proportion of organic matter is in a measure due to the fact that the feed-water is taken from the condensed hot water of the air pumps, the boiler being used in a beet-root sugar works and refinery.

MECHANICAL AND MORAL PROGRESS.—Mechanics are moral reformers in the broadest sense of the term. They may work with an eye single to their daily wages, but they are nevertheless gradually changing the whole drift of human affairs. Every machine, large or small, be it a one thousand horse-power engine, or a kitchen mangle, is an engine for the advancement of the moral as well as physical nature of the race. Every blow the smith strikes in his workshop is a blow at the slowly yielding barrier that separates the dimly-lighted "now" from the clear light of the "yet to be." Spencer himself would never have been the great leader of thought that he is, had it not been for millions of just such blows. Blows preceded hooks, and books were before Spencer.—*Am. Artisan.*

SCIENTIFIC PROGRESS.

Electrical Phenomena—Ball Lightning Explained.

It was formerly assumed that great masses of clouds—thunder clouds—are themselves the generators or sources of those great charges of electricity which result in thunder and lightning; but late investigations render it more probable that such clouds merely act the part of the coatings of a Leyden jar to accumulate and concentrate the charge at some projecting point—a positive pole, whence it may pass by an eruptive discharge to a negative pole. Electricity exists in the air, whether cloudless or otherwise, and a heavy, moving cloud, merely acts the part of a carrier or accumulator, the charge of which continues to increase until its intensity is sufficient to jump the chasm which exists between it and the nearest negative pole—be it another cloud or some projecting conductor presented by the earth.

In a paper recently read before the Society of Telegraph Engineers, of London, by W. S. Proce, Esq., we find the following in reference to some of the various phenomena presented by atmospheric electricity:

Lightning is usually classified into *sheet*, *forked* and *ball* lightning. *Sheet* lightning is merely the reflection of forked lightning, or the electric discharge which has occurred somewhere out of the field of view. *Forked*, called *zig-zag* or *chain* lightning, is the light produced by the disruptive discharge between cloud and cloud, or between cloud and earth. *Ball* is of a very different character. Many of the so-called "balls" are undoubtedly optical illusions, and Faraday himself stated that they were incompatible with what we know of electric discharge. "There may be balls of fire," said he, "but they are not electrical." Yet the evidence of balls of blue fire rolling along the surface of the sea, and suddenly terminating in terrible electric discharges over ships; masses of fire rolling along the ground towards buildings, ending in fatal discharge, and many other cases, leave it unquestionable that some such phenomenon as globular or ball lightning exists. Some have explained them to be balls of incandescent gas, rendered so by the discharge; but Mr. Cromwell Varley has recently offered a more acceptable explanation. According to him, ball lightning is a luminous spot on the earth, terminating a current or brush discharge from a negatively charged cloud. This spot moves with the cloud. Illuminated lines of force are projected from some point in the cloud upon the earth. He has been very successful in repeating the effect experimentally, and he suggests this fact as an explanation of the photographic images imprinted on the skin of persons struck by lightning.

I quote from memory: "When after a serene sky, thunder clouds form in the distance, the observer sees the clouds and the illumination of the lightning displayed before him as a magnificent picture; and what he often takes to be forked-lightning (i. e. the actual flash, and not the reflection of it) appears to run through the clouds in the most beautiful manner." "That which is thought to be the electric discharge is only the illuminated edge of a cloud, beyond and behind which the real discharge occurs. It is in its nature like the bright enlightened edge which a dark well-defined cloud often presents when between the sun and the observer, and even the moon also frequently produces similar appearances. In the case of its production by lightning and distant clouds the line is so bright by comparison with the previous state of the clouds and sky, so sudden and brief in its existence, so perfectly defined, and of such a form as to lead everyone at the first moment to think it is the lightning itself which appears."

Hence many of the errors made as to the character, shape, and condition of the lightning flash.

OXYGEN ON LIFE IN WATER.—According to Dr. Carpenter, if we go deep enough in the open sea we shall always find the temperature as low as 32°; but in inclosed seas, such as the Mediterranean, the deeper and colder water, circulating from the poles, cannot enter; therefore the lowest bottom temperature is determined by the lowest winter temperature of the surface. Scarcity of life in the Mediterranean he considers to be owing to a deficiency of oxygen in the water, due to its combining with a large quantity of organic matter brought down by the rivers and emptying into it. Thus, while in the Atlantic we usually find 20 per cent. of oxygen and 40 per cent. of carbonic acid, in the bottom waters of the Mediterranean there is often only 5 per cent. of oxygen and over 65 per cent. of carbonic acid.

SCIENTIFIC PROGRESS.—What would the great father of British chemistry have said, had he stood in the lecture room of the Royal Institution, where his great discoveries were made, and seen the burning hydrogen extracted by our great countryman, Graham, from a meteorite, the heat and light of another world; or could he look with Lockyer on the burning flames of hydrogen, which dart up from the sun to a height of 50,000 miles, or could he read the flashing telegrams which so rapidly run around the world, that our notions of time are completely upset, and we actually receive intelligence to-day which was sent to-morrow.

High-Pressure Steam—Compound Engines—The Locomotive.

At the last meeting of the Scientific and Mechanical Society, of Manchester, England, the President, Sir William Fairbairn, in his opening address spoke on the subjects above named as follows:

It has been my province for a great number of years to encourage and eliminate the force of high-pressure steam, and by working it extensively in properly constructed engines, to effect a saving of fuel under any condition and every circumstance to which it is employed. I need scarcely inform you that much has already been done in that way, and that a saving of one-half the fuel has been effected by working high steam expansively over what could be accomplished forty years ago. I am not prepared to state the amount of pressure to which steam may be increased; but, I have reason to believe that we are still far short of the maximum to which the pressure of steam and economy of fuel may be carried. We are still far short of the economy which may yet be obtained by working steam expansively, and the interesting question—which has never yet been solved—as to whether the system of expansion should be done in one, two, or more cylinders, requires to be determined. There are strenuous advocates for each system, and I have myself gone so far as to encourage the use of three-cylinder engines in order to determine its efficiency as compared with the double and the single cylinder engines. Now, in every case of mechanical construction, I have ever been the advocate of simplicity, and never employ two things when one is sufficient; and I therefore prefer the single cylinder, with a proper cut-off apparatus, to one or more cylinders effecting the same object. Among engineers and manufacturers there is great diversity of opinion, not only as regards the advantages of high steam, but the way in which it should be applied. This diversity of opinion should not, however, discourage the thoughts and labors of original thinkers. On the contrary, it ought to invigorate active minds, correct ignorance, and exhibit, by actual experiment, that hastily formed schemes are injurious, and that nothing is sound in physical science unless founded on the unalterable laws of nature. What I would therefore recommend would be that the investigations, thoughts, and aspirations of the Society should be to subjects that lead to definite laws, by which ingenuity may be strengthened and from which we cannot retreat.

The Locomotive Engine

Has undergone many changes since it was first introduced, and nothing has contributed more to its success than the introduction of high steam. It has been in good hands ever since the days of George Stephenson to the present time, and we have only to trace its energy and growth to assure ourselves that it has not attained its present high state of perfection without the assistance of some of the master mechanical minds of this and other countries where it has made its appearance. It still remains to be seen what further improvements can be made, or whether an increase of pressure and greatly increased expansion may or may not diminish the consumption of fuel without effecting the efficiency of the engine. As regards the design and organization of the engine as a machine, much cannot be done, as its adaptation in most cases is admirably arranged for the purposes for which it was constructed, and all that appears wanting is a series of well-considered regulations to insure safety as it traverses the different lines from one end of the kingdom to the other. These are considerations for the management, more than the engineer or man of science, but there is, nevertheless, room for thought and meditation, sufficient to engage the attention of the Society in its endeavors to effects further improvement.

FORMATION OF FLINT.—Mr. Solas, at a late meeting of the Geological Society of London, said that he did not think that any mere mineral change could account for the forms of flints. Alluding to some previous remarks, he said he had only dealt with a limited portion of the question of the origin of flint and coprolites. Of the organic origin of the latter he thought there could be no doubt. Flint was formed not by the silicification of sponge tissue, but by that of animal matter. He thought that the non-silicified condition of recent dead sponges might be due to a defective supply of silica in the sea water. He had not put so much stress on dialysis as had been supposed, but relied mainly on the deposition of flint by means of organic matter. From the presence of *silicious* spicules of peculiar forms in the coprolites, he could not accept them as of Alcyonarian origin.

RECOVERING GOLD AND SILVER FROM PHOTOGRAPHERS' TRIMMINGS.—The *American Chemist* recommends the following process: Burn the paper carefully, and then treat the ash with chlorine gas to convert the precious metals into chloride. The ash may then be thrown on a filter, the gold chloride separated from the silver chloride, by washing, and the two reduced at pleasure. The recovery of gold from the slops, by means of ferrous sulphate, is extremely faulty, if it is intended to use the gold afterward for photographic purposes, as iron, in the form of a basic ferric salt, is almost sure to be mixed with it. Kniger recommends precipitating the gold by the addition of ammoniacal chloride and hydrochloric acid, which precipitates it absolutely pure.

the lower depths. Work of exploration is going on.

HOWARD HILL.—This mine is located about 2 miles east of town. The shaft is down 390 ft., or 100 ft. below any former working. From the bottom of the shaft drifts to the east and west are being run, and each of these is in about 30 ft. The drift to the east is in quartz which shows free gold and heavy sulphurets. The drift to the west is also in quartz. In both drifts there are fine veins. In years past in the level above the lowest level, now being worked, splendid ore was found to both the east and west of the shaft. In a few days the lowest level will reach the line of the old pay chute, and already there are signs that the ledge is getting good.

INDEPENDENCE CON.—This Co. own a tunnel claim at Independence Hill, near Dead Man's Flat. The tunnel, in all probability, will run through the mountain, and cut in its course some 3 or 4 large ledges, which crop out on the surface, and probably some blind ledges. It is now in 352 ft., and in very hard rock. Several stringers of quartz are now seen in the end of the tunnel, and the stringers prospect well in a hand mortar.

DATSY HILL.—This mine is still doing well. The last crushing gave \$42 to the ton. The shaft is down 315 ft. on the ledge, and miners are running levels from that depth. The quartz which is being taken out comes from the 225-ft. level, and to all appearance is superior to that recently crushed.

GREEN MOUNTAIN.—They have been running 5 stamps most of the time during Jan. The work of development has been going on, and the developments are such that the month of Feb. will give a splendid result from the mill.

NORTH STAR.—They have splendid ore in the new shaft which is being put down at a point east of the dry house, the ledge being well defined and strong.

WEST IDAHO.—The Co. have claims located on Slate Creek. The location consists of 1,500 ft. on the ledge there being good rock on the croppings.

PLACER COUNTY.

RICH STRIKE.—Placer Herald, Feb. 1. Two men (whose names for the present we enquire, as well as the exact locality where the treasure lies) have struck a fabulously rich quartz lead, less than 3 miles from here. We have seen a 15 ounce lump of the rock, and should say that fully 6 ounces of the weight is pure gold. Last Thursday they had come 2 or 3 hundred pounds of this rich rock. The quartz is a dirty white color, and literally sewed together with pure, bright, thread gold. They have a shaft down some 9 ft., and had traced the ledge by its rich croppings to this point and there started the shaft on what seemed to be the richest locality.

GOLD RUN.—Cor. Placer Argus, Jan. 29: At one time this winter there were 10 or 12 claims worked in this district; at the present time I believe there are but 6. The Pine Top, Church, Golden Gate, Gold Run and the Home Ticket have expended operations and will so remain till more water comes. The Pacific, Union, Harriman and Taylors two claims, Gold Run Hydraulic, (formerly the Cedar,) and the Indiana Hill claims are still running and with a certainty of good pay as long as they can wash. The Indiana Hill claims have a splendid rig, probably the best in the district, they use 500 inches of water with a pressure of about 300 ft. The last clean up of the Pacific was, I am told, the largest ever made in the district with one exception; the exact amount I do not know, but \$7,000 more or less.

SIERRA COUNTY.

REIS.—Downville Messenger, Feb. 1: The new mill was started about 10 days since, and the new wheel found of sufficient power to run all the stamps, pans, settlers, etc.

INDEPENDENCE.—The improvements on the mill are completed.

ALLEGHANY.—Our mining interests are looking brighter. The Buck Eye has struck splendid prospect. The Highland & Masonic is now taking out good pay. The Twenty One Quartz Mining Co., is still sinking, and their ledge improve as they go down.

GISSONVILLE.—The Rip Van Winkle Hydraulic Co. are in full operation. They had cut a small pile of gravel at the coming of water, drifted from a pillar left standing by the former owners, from which they cleaned up nearly \$3,000 including \$1,300 taken from a boulder found in the pillar. The Chalcedony, Boot-jack, Union and Nevada are reported as paying fairly. The Pilot, at the upper end of the Valley, adjoining the North American, is a new claim, now running out the first gravel, after years of expense. They have done no washing as yet, but report paying prospects.

TUOLUMNE COUNTY.

SANTA MARIA.—Sonora Democrat, Feb. 1: The first clean up at this mine was made on Monday after 6 days run with 10 stamps, crushing 60 tons of ore that yielded \$3,000, or \$50 per ton. The ore crushed was all taken from the tunnel being run in on the vein, and is regarded as a fair test of the average rock. The tunnel is 50 ft. in the pay chute, the vein averaging 2 ft. in width. From surface indications the pay chute is 120 ft. in length, pierced 50 ft. by tunnel.

KERN COUNTY.

GOOD CLEAN UP.—Havilah Miner, Jan. 25: Joseph Moeman & Co. were the fortunate recipients of \$600 from a little batch of rock, about 25 tons.

ST. JOHN.—They have now attained a depth of 500 ft. on their mine. The lower level shows a body of ore from 6 to 7 ft. in width. There

is now rock enough in sight to run the company's 12 stamp mill for 3 years. Some of the richest rock ever found in the mine was struck last week.

PIUTE.—The mining prospects are splendid. The Bright star mine has opened on its new level with an average ledge of 6 ft., and very rich.

MARIPOSA COUNTY.

PINE TREE.—Mariposa Gazette, Jan. 31: Early last week the Co. set some men to work in an old tunnel which had been run for the purpose of taking rock out of the old Pine Tree. On following this vein 8 or 10 ft. to the northward it was found to increase to a width of 3 ft. with well defined walls. The rock appears to be very rich, showing free gold throughout the whole of it.

Nevada.

ELY DISTRICT.

ARKANSAS.—Pioche Record, Jan. 26: Drift is in 65 ft. from the 550-ft. level. A vast extent of good ore is exposed.

BULL CROSBY.—This is a ledge between Pioche and Ely. The vein when first struck is 7 ft. wide, and the ore is good.

BURLEY.—A strong vein of very rich argilliferous galena has been entered, at a depth in the main shaft of about 50 ft., and the indications are that it is permanent in character.

CHIEF OF THE HILL.—Last Thursday afternoon the main shaft started on a run of 10 tons of high grade ore from this mine. The main shaft is now down 90 ft., timbered from top to bottom.

CHIEF, EAST EX.—The winze below the 90-ft. level has attained a depth of 85 ft. The ledge is well defined all the way. Are starting a prospecting drift eastward 40 ft. from the top of the winze, which is now in 18 ft., with small streaks of splendor ore coming in.

ELVEN.—The main shaft is now 200 ft. deep, from which point the first level was run out. It will cross the vein at 300 ft. The ore is looking well in all parts of the mine. There are now on the dump 100 tons of first-class and about 200 tons of second-class ore.

HORN & HUNT.—There are now on the dump at least 100 tons of second-class ore from the back ledge, which will average about \$20 a ton, about 10 tons of first-class ore, averaging from \$500 to \$700; and about 75 tons of ore from the front ledge, averaging \$100 a ton. The main shaft on the front ledge is down 140 ft., below the tunnel level. The east drift is in 80 ft. and west drift 40 ft. and the ledge is running from 18 inches to 4 ft., well-defined, with fine walls. The east drift from the tunnel level on the back ledge, is 100 ft. long, and the west drift on the tunnel level is 60 ft. A winze has been sunk 33 ft. below tunnel level, with drifts from the bottom thereof about 80 ft. each way. Have just commenced stowing in this ledge, and one also is up 40 ft., ore showing good in all parts.

MARRON.—The main winze is now down 248 ft., all the way on the ledge, which is now 3 ft. wide, and looks very promising.

MILPAPA.—A large quantity of very rich ore are still being brought to the surface, and the ore-breasts are undiminished in extent and riches.

NEWARK.—A magnificent new body of ore was struck during the week in the main shaft of this mine. The vein is very wide where crossed by the shaft, and the ore assays well.

PIUTE.—Shipments of ore from this mine for the month amount to 135 tons. There is now on hand, ready for shipment, a large amount of bullion—well on to 700 pounds.

PORTLAND.—During the week a rich strike was made in the winze, the vein widened out vastly, and the assays show an increased richness in the ore.

ST. JOHN.—The tunnel is now in 120 ft. and 25 ft. more will strike the ledge, and 75 ft. more the incline. There are now about 30 tons of ore on the dump-pile, which will average \$100 per ton.

STANDARD.—Down 170 ft. in the working shaft; drifting east and west on ore 2 ft. wide. Ore assays from \$119 to \$581.

EUREKA DISTRICT.

ORANGE.—Eureka Sentinel, Jan. 30: One of the richest strikes ever made in this district has just been realized in this mine, which is located on Prospect Mountain. At a depth of 350 ft., a ledge of beautiful white quartz and a vein, at present over 2 ft. wide, has been reached, presenting a mottled appearance, produced by accretions of bluish silver ore, thickly interspersed among the rock, with a small quantity of arseniate of lead staining other portions. It is a fine milling rock, and assays \$113.37 in silver.

BELMONT.

EL DORADO SOUTH CON.—Reese River Revue, Feb. 1: This Co. are working in the south incline of the El Dorado mine, on the largest and richest breast of ore ever have ever seen in Eastern or Middle Nevada. This breast now measures over 15 ft. from foot to hanging wall. The stopes in the 240-ft. and 340-ft. levels, from the main incline, are looking splendid and the ore is of a better quality than it formerly averaged.

MONITOR CO.—The upper tunnel stopes look as nice as ever and are turning out large quantities of rich chlorides also turning out fine milling ore from lower tunnel stopes. The Monitor mill is crushing over 20 tons of Monitor mine ore daily and is producing very fine bullion.

WASHOE.

ALAMO.—Gold Hill News, Feb. 1: The main north tunnel is in 110 ft., making good progress. The old shaft on the hill has been cleaned out and repaired to the depth of 120 ft.

BELOHER.—Daily yield, 300 tons, about 100 of which comes from the 1,200-ft. level through the winze, 200 ft. from the Crown Point line. The ore body at the line of the Crown Point at the 1,300-ft. level is not only the largest and richest ore body the world ever knew of, but its real immensity is as yet undeveloped, as it grows wider and longer, increasing in all directions as greater depth is attained.

CALDERONIA.—A second cross-cut west from the main north drift on the 400-ft. level of the new shaft has been made, cutting the ledge at point further northward, showing a very decided improvement in the quality of the ore.

CROSSLAR-POTOSI.—Daily yield 120 tons, the assay value of which is \$36 per ton.

CHOWEN POINT.—During the past week ore has been rushed out at the rate of nearly 500 tons a day, principally from the 1,000-ft. level. The 1,300-ft. level opens out richer and richer. There is no sort of indication of the bottom of the ore body being reached. The yield of the mine for the past month of January is expected to foot up to about \$700,000.

HALE & NONOSES.—The daily yield of ore has been increased to a small extent during the week, and the average value of the ore has been improved.

JULIA.—The 1,000-ft. station is finished ready to commence the work of drifting. Sinking the shaft for a new level has been resumed.

KENTUCK.—The old workings are yielding about 25 tons per day of very good ore.

OVERMAN.—The main west drift is again cleaned out, repaired, and work resumed in the face.

SAVAGE.—Sinking the incline is making steady progress. The main shaft drift on the 1,600-ft. level, to connect with the winze from the 1,500-ft. level, is progressing. The main north drift on the 1,600-ft. level, to connect with the south drift from the Gould & Curry is driven ahead.

SIERRA NEVADA.—Daily yield, 60 tons of good milling ore.

SUTRO TUNNEL.—Total distance in, 3,583 ft. Excellent progress is being made in sinking the shaft along the line of the tunnel.

VINDICATOR.—The main north drift on the 1,167-ft. level from the Gould & Curry shaft is still driven ahead. The drift, although being run outside of the ledge, has cut several stringers of quartz and ore.

WOODVILLE.—The ledge is being cut through at the second level and opens out finely with excellent ore as in the level above.

EMPIRE MINE.—Virginia Chronicle, Feb. 1: It is reported that a body of ore has been developed which extends the entire length of the Empire ground, 75 ft., and also through the grounds of the Trench and Eclipse which lie between the north and south Empire, that will mill from \$30 to \$45 per ton.

IMPERIAL.—The Imperial-Kempire shaft is 1,700 ft. deep. The drift running south on the 1,700-ft. level has been cut through the quartz at a depth of about 100 ft. from the 1,600-ft. level. The winze now being sunk from the 1,600 to the 1,700-ft. level is in ore that assays on an average \$80 per ton.

OPHIR.—Since the new shaft of the Ophir was commenced the prospects in this mine were never better than they are at present. On every level that is open, and a cross-cut has been made, the quartz has been found. From the shaft on the 700-ft. level for 900 ft. north they have very favorable indications.

MINT.—Gold Hill News, Feb. 4: Superintendent Coleman left for San Francisco last evening, in order to procure requisite hoisting machinery. The shaft in sinking passed through the ledge, developing very fine ore, and now, owing to the ledge running and the other way they had the bottom of the shaft cutting it again and developing much better ore than at the other point mentioned. In fact, some of the ore is of the richest silver sulphuret character, and will pay well under the stamps.

S. F. ALTA. Feb. 6: The Superintendent of the Mint mine arrived yesterday from Virginia City, bringing a quantity of ore taken from the shaft at a depth of about 90 ft., and assaying from \$740 to \$4,600 to the ton. Much of this ore consists of black sulphur of silver, similar to the richest that have been found in any of the Comstock mines. The extent of the ledge, where it has been struck, covers the whole of the bottom of the shaft, which is 4 ft. square, but its entire size has not yet been ascertained, as the hoisting machinery has not yet been fully adapted to keep the shaft clear of water. The shaft is situated about 460 yards southeasterly from the Savage mine, and 700 yards from the Gould & Curry.

Arizona.

YAVAPAI CO.—Prescott Miner, Jan. 18: The Del Paso mill is running on ore from their War Eagle mine. The Marcus Co. are still crushing quartz and making money. Immense banks of gravel have been found in the Santa Maria country, that will, sooner or later, be worked, as said gravel contains gold in paying quantities. Water is plentiful. The placer miners around Prescott are doing well.

YUMA CO.—Our Arizona city contemporary says that Messrs. Hopkins & Miller are pushing work on their mines in Castle Dome District, and shipping much ore to San Francisco.

MOHAVE CO.—Baker's furnace, at Chloride, started smelting ore the 5th inst., and on the morning of the 6th had run out 30 bars of bullion. The ore the furnace is working is, taken from the veins near Cerbat and hauled to Chloride, about 14 miles.

CORY & POTTS. Cerbat, have just shipped 5 tons of ore to San Francisco, which is expected to yield at least \$1,000 per ton.

The Gunsight is said to be turning out ore of extraordinary richness.

Colorado.

LITTLE GIANT.—Georgetown Mining Review, Jan.—This ledge lies on the left side of Axtell Gulch and is clearly exposed for 80 ft., the crevice being narrow, scarcely exceeding 18 inches containing seams of pay consisting of free gold, iron pyrites and argilliferous galena.

GREEN MOUNTAIN BOY.—This is a huge crovice on the crest of the mountain 50 ft. in width, its walls being distinctly marked and pay visible from the surface; 3 miles off, what is believed to be the same vein, has been struck.

CLEAR CREEK CO.—The length of the following tunnels in number of feet is: Eclipse, 630; Douglass, 280; Helmick, 520; Baltimore, 680; Burleigh, 1,350; Marshall, 1,300; Antelope, 125. The Baltimore has expended \$100,000 and the Burleigh \$150,000. The Marshall intends to tunnel through Leavenworth Mountain a distance of 3,912 ft. intersecting at least 50 ledges thereby, including the most valuable silver veins in the Territory.

RED CLOUD.—This mine produced in the last 4 months \$61,000.

CROCKAW.—A shaft 100 feet deep revealed pay ore at one place 12 inches wide. In 1868 ten tons produced 160 ounces of silver per ton and 60 per cent. lead.

HOMESTEAK.—Situated in La Paz Co., and was sold by discoverers for \$25,000. The vein averages 4 ft. wide and the ore seam from 10 to 24 inches. The mill returns vary between 250 and 300 ounces of silver with 25 to 75 per cent. lead.

Montana.

NEW STRIKE.—Montanian, Jan. 23: Several fine quartz veins were left at our office, this week, taken from a newly-discovered ledge near Ryan's Junction. It is claimed that 4 ozs of bullion were pounded out of the rock by hand-mortar process. The new ledge is said to be 2½ ft. wide.

PLACER DISCOVERY.—Helena Herald, Jan. 23: We learn that new and very promising placer diggings were last week discovered in the Left-hand Fork of Little Deep Creek, Meagher Co. The report comes that as high as \$1 dollars had been panned out in one day from the Prospect shaft. The lucky miners were in Helena, on Saturday, purchasing sluice lumber, tools, grub, etc., and departed for the new El Dorado.

NEW DIGGINGS.—Deer Lodge Independent, Jan. 25: We are informed that the prospecting party, who were prospecting for some time in Bear Straight, a tributary of German, went through a false bed-rock last week and struck a paying strata of gravel underneath. The indications are that the gulch will pay for some distance, and is longer than German.

GERMAN.—The miners are busily engaged sawing blocks, repairing flumes, telegraphs, etc., in order to be ready for the coming mining season. The Chinese miners have been working all winter, having kept fires burning day and night all the time since the cold weather commenced.

Utah.

LITTLE COTTONWOOD DISTRICT.

VALLEY.—Salt Lake Tribune, Feb. 1: From the back end of the 80 ft. tunnel there are 2 stopes running upwards, one a distance of 125 ft., and the other about 75 ft. In these stopes can be seen an immense deposit of ore, varying all the way from 2 to 6 or 8 ft., though the ore body has not been cut through in some places, consequently it is difficult to determine the size of the ledge. In the lower level there is a continuous vein of ore the width of the distance run that will average perhaps from 2 to 3 ft., the grade of which is higher than that taken from the stopes above. The character of the ore taken from this mine is galena and carbonate mixed, and is said to be worth 50 ounces in silver to the ton, and carries 45 per cent. lead.

MINER DONNELLY.—Revealed the Anador and Eberhardt mines were bonded for the sum of \$40,000, to Q. A. McCone, to be placed in the Canadian market. These mines are situated directly west of the Fuller mine, the first named of which, is on what is thought to be a continuation of the Fuller lode. The assay value of the ore taken from both of these mines, near the surface, is about \$75 to the ton.

GRASS VALLEY MINES.—Mr. A. Delano who was for many years Recorder of the Grass Valley mines, last week delivered a lecture, which was reported in the Grass Valley Union, in which he makes some interesting statements. He says there are about 11,000 distinct quartz ledges recorded, of which it is safe to say 500 can be worked to a profit with improved appliances, and would employ 25,000 men. Of all these mines in a territory of about five miles square, only ten or twelve are being worked. In contrasting the gold yield of early days with the present, the speaker remarked that in the early days, with a working force of 5,000 men, something like \$300,000 was taken out monthly, mostly from surface diggings, now mostly worked out; while now with the few mines at work, some but recently opened, the monthly shipment is about \$250,000 and is rapidly increasing. Now, 2,000 men are taking out over two-thirds as much gold as 5,000 extracted fifteen or twenty years ago. Mr. Delano approximates the total gold yield of Nevada county, since its discovery, at \$105,000,000, of which Grass Valley yielded \$40,000,000; Nevada City probably shipped \$40,000,000; San Juan at least \$10,000,000; Columbia, North Bloomfield, Washington, Omega, Cherokee and Woolsey's Flat \$10,000,000; other localities \$5,000,000. There are yet miles of mining ground untouched.

WHELPLEY & STORERS' PULVERIZER.—At the "Big" mine in Calaveras county one of Whelpley and Storers' Pulverizers has been erected, and according to the Angels Mountaineer is giving good satisfaction. Some 1,200 pounds of hard rock from the Seefford mine, near San Andreas, was put through as a sort of test. The Mountaineer gives a description of the machine, but as we have already given an illustration and frequently referred to it, our readers are doubtless familiar with its general construction. The paper above mentioned thinks that "it is destined to bring about a revolution in the system of quartz crushing, for not only does it do away with the erection of costly mills and works, but crushes ore to a greater degree of fineness than any mill ever could." The editor predicts that it will eventually supersede all milling processes for crushing ore. As a prospecting machine it is specially useful, as ores can be practically tested without expensive works being erected.

THE CIVIL CODE ON CORPORATIONS.—The County Recorder calls attention to the fact that several newly formed corporations have not complied with section 365 of the new Civil Code, which requires all corporations to file and record their by-laws at the office of the Recorder of the county in which the headquarters of the corporation is situated.

FOUNDRY WORK.—At the Occidental Foundry in this city the monuments to be used in making the boundary line between Nevada and Oregon are being cast. The monuments are quite plain, and bear the letters "Nevada, Oregon, Longitude, Degrees," and were designed by Colonel Von Schmidt.

TANNER RAILROAD BRAKE.—The Tanner patent brake extension claims are engaging the attention of the House committee on Patents this week. This is something which is of interest to all railroad companies.

WILD TURKEYS.—A number of wild turkeys from Illinois have been received in this city during the past week and are to be turned out in pairs in Tulare, Alameda and Marin counties for the purpose of stocking the woods.

New Incorporations.

The following companies have filed certificates of incorporation at the County Clerk's Office in this city: **MANSTEIN G. M. Co.**—Feb. 4. Location: Kelsey Mining District, El Dorado county. Capital stock, \$300,000, in 30,000 shares. Trustees: George E. Hinckley, George A. Gates, W. W. Higgins, J. Ellis Hill and Wm. Small.

"WINE DEALERS' GAZETTE" Association.—Feb. 4. Object: To publish a newspaper called the Wine Dealers' Gazette, and to do general printing and publishing business. Capital stock, \$100,000, in shares of \$1,000 each. Directors—M. S. Whiting, Charles Hosmer, Wm. M. Hussey, Warren Loud and R. G. Reney.

Meetings and Elections.

MARIPOSA M. Co.—The New York Times of the 25th ultimo, says: "The Directors elected at the annual meeting of the Mariposa Land and Mining Company were F. B. Wallace, Chauncey Vibbard, George W. Butts, Ludlow Patton, Mark Brumagin, and the officers, Mark Brumagin President; George W. Butts, Vice-President; F. B. Wallace Treasurer."

CALIFORNIA POWDER WORKS CO.—Feb. 5. Directors—J. H. Baird, (President), J. B. Haggis, J. O. Earl, G. J. Lawton and W. G. Kittle; John F. Lohse is Secretary and Treasurer.

WELLS, FARGO & CO.—Feb. 5. Directors—Lloyd Tevis, W. G. Fargo, A. H. Barney, D. P. Cheney, D. O. Mills, Leland Stanford, J. B. Haggis, Oliver Eldridge and Mark Hopkins.

One of the Old Churches.

We sometimes like to linger along the great highway of life and if possible, here and there gather and garner up one of the rapidly paling leaves of history. And though they appear to be in temples of rock, reared by the hands of men, they are still but frail records of the past, perishable, mouldering leaves of time.

In fancy we can call up the history and condition of the beautiful valley of San Xavier Del Bac, one of the earlier homes of the Jesuit Fathers, in Arizona; its beautiful groves of olives, palms, orange and fig trees, and gleaming in the sunlight, the gilded domes of the magnificent church of that ancient and holy order; but it would be only fancy; for though hardly more than a century has passed since its loveliness was the historian's and even the poet's theme, now all is barren and desolate.

The coil once teeming with all the wealth of forest, fruit and flower, now only reflects from its parched and seared surface, the dancing and dazzling rays of a tropical sun. The glory of its irrigating aqueducts has departed and only the ruins of what was once the grand Church of the Mission, remain as a shattered and torn leaf to record the place of early, laborious, but for the time being, successful missionary labor.

The Poison-Oak and its Antidote.

In the woods and thickets of California, as well as on the dry hillsides, and, in fact, in every variety of locality, may be found a very venomous shrub—the "poison-oak" or "poison ivy;" the *hiedra* of the Spanish people—the dread of all those who are acquainted with it. This plant is known scientifically as follows: it belongs to the natural order *Anacardiaceae*, and is called *Rhus diversiloba* by Torrey and Grey; *Rhus lobata*, by Hooker; and *Rhus toxicodendron*, by Hooker and Arnott. It is similar to the poison ivy of the Atlantic States (*R. toxicodendron* Linnaeus), both in its appearance and in its poisonous qualities. But it is unnecessary for me to describe it, even popularly; for it is unhappily familiar to all, and I will only remark that, although generally a small shrub, the trunk sometimes attains the diameter of six inches, and the whole plant climbs over some large tree for support. The finest specimens that I have ever seen were in an oak and laurel grove, on the road south to San José.

I do not need to describe the cutaneous disease that is produced by contact with or approach to the poison-oak. And it is hardly necessary to advert to the fact that this poison is the cause of a vast deal of misery and suffering in California, and that there is scarcely ever a time in any little town or neighborhood when there are not one or more persons suffering from it. Farmers and laborers are especially liable to this poisoning, and besides the suffering and annoyance caused by it, the loss of valuable time is no small item to be taken into account. Truly he who makes known a prompt and sure antidote to this poison will be a public benefactor; and this communication is made to the public with the confident expectation that the remedy here described will prove to be such benefaction.

The remedies in use for the effects of the poison-oak are quite various, and some of them will cure the milder cases. Of all the common remedies, the warm solution of the sugar of lead has within my experience been productive of the best results. The water of ammonia, warm vinegar and water, the warm decoction of the leaves of *Rhamnus oleifolia* ("Yerba del Oso," of the Californian-Spanish), or even pure warm water, are sufficient sometimes to produce a cure. All these remedies are, of course, applied externally by way of washes to the parts affected. But the only remedy that I have found invariably successful as an antidote for this poison, is an indigenous plant growing very abundantly in this vicinity (Monterey), and in other parts of the State. It is a tall, stout perennial, belongs to the composite family, and looks like a small sunflower. It is from one to three feet high, has bright yellow flowers in heads one or two inches in diameter (and as I have said), like small sunflowers, flowering from June to October. Before flowering, the unexpanded heads or buds secrete a quantity of resinous matter, white and sticky, like balsam, that is finally, after the flower expands, distributed over the petals, etc., of the flower like varnish. The whole plant—flowers, leaves, and all, is resinous and viscid. When it grows on dry hills, it is stiff and rigid, with narrow, thin leaves; but in damp localities it is more robust and succulent, with wide, fleshy leaves. Its botanical name is *Grindelia hirsutula* and *G. robusta*; but I have not been able to find more than one species, and all the different forms possess the same remedial virtues.

The mode of using it is as follows: Bruise the fresh herb and apply it by rubbing over the parts affected; or, boiling it in a covered vessel, make a strong decoction of the fresh or dried herb, with which to wash the poisoned

surfaces. Its remedial properties appear to be contained chiefly in the resin or balsam-like juice of the plant, which is particularly abundant on the surface. One application is sometimes sufficient for a cure; but if the disease has been of long duration, several days will elapse before relief is obtained. This plant is a remedy for the poison-oak, used originally by the Indians of this vicinity, and by them its virtues have been communicated to the Spanish-Californian people, who are now commencing to use it.—C. A. Canfield, M. D.

Resources of Utah.

We continue these excellent articles from page 66, from the Salt Lake Tribune:

Mining Districts.

The principal mines in main Bingham are the Winnemuck mine and tunnel, with three

Crosue, Last Chances and many others.

Rush Valley District.

In Tooele county, is situated on the west slope of the Oquirrh range of mountains, forty miles southwest from Salt Lake City, on the overland stage road.

The district was located in June, 1864, and the city of Stockton laid out in the same year. Immediately after the discovery of mines was made, a good deal of capital was invested to aid in developing them.

The principal lodes of the district embrace the following: The Silver King and West Extension, Silver King No. 2, and on the east end the Bolivia and Tucson. The Pleasant Hill, Last Chance, Defiance, Potomac, Eureka, Quandary, Vulcan, Metropolitan, Legal Tender, St. Patrick, Great Basin, Our Fritz, Mineral Hill, Peahody, May Bell, Lady Douglas, Great Central and Silver Queen.

The description of ore is argentiferous ga-

MISSION CHURCH OF SAN XAVIER DEL BAC.

smelting furnaces, recently sold to a European company. The West Jordan, Kenosh, Galena, Orphan Boy Consolidation, Vespacon, Sultana, Elizabeth, Northern Light and Fairview, also, the Red Warrior, Dartmouth, Portland and Belshazzar belonging to the Utah Silver Mining Company of London, who have smelters and roasters attached. Also, the Kelsey tunnel, located in a belt of oxides, ten in number, owned by the Kelsey Tunnel Silver Mining Company. This tunnel is already worked some 350 feet into the body of the hill, and has crossed two of the veins six feet and nine feet in thickness.

On Silver Hill also, in Main Bingham, are

lena and carbonate of lead, carrying from 50 to 60 per cent. of lead and from \$25 to \$125 in silver per ton of ore. The ore is considered to be first-class for smelting.

The Ophir District

Was formerly part of the Rush Valley District, and was organized in June, 1870. It is distant fifty-five miles from Salt Lake City, and is celebrated for the richness of its mineral veins. The principal mines in the district may be classified as follows:

EAST CANON,

On the northeast side of the cañon, known as Ophir Hill, Miner's Delight or Blue Monster,

LEAF OF THE POISON-OAK.

POISON-OAK IN MINIATURE.

the Spanish, the Queen and Bukeye mines, lately incorporated in New York with a capital of \$500,000.

In Bear Gulch placer claims are worked.

On the divide between Main Bingham and Butterfield Cañon is the Eagle Bird, a mine of great promise, and to the left the Yosemite and Telegraph mines, the latter shows large bodies of carbonate ores in all openings upon it.

In Butterfield Cañon are the Oceola, the Lucky Boy and the Bemis and Hiatt, all well developed and valuable mines.

In Spring Gulch are the Greeley and Royal lodes, also the Legal Tender, all of them bearing ore of a high grade and milling character. In Carr Fork the Nahoh, White Pine and Clipper.

In Muddy Fork the Saturn, Last Chance and Greens.

In Markham Fork the Washington, Oro and others.

This district is one of great promise, and well deserving of attention, its accessibility at all times of the year, the early completion of a railroad connecting it with the Utah Southern Railroad, and the promising appearance of such mines as the Winnemuck, Northern Light, Fairview, Orphan Boy, Lucky Boy, Telegraph,

Poor Man's Friend, Bath, Buckhorn, Keystone, Fairview, McCullom, Hidden Treasure and Grant Tunnel. The ores are carbonates, chlorides and galena.

ON SILVERADO HILL

Is the famous Silveropolis mine, from which such rich specimens have been extracted, and also the Shamrock, (the ores of which have assayed so high).

LION HILL.

On the west side, or Lion hill, are the Mountain Lion, Mountain Tiger, Zella, Snnnyside, Silver Chief, Silver Exchange, San Francisco, Defiance, Valley Tan and New York.

The character of ore is chlorides and rich sulphurets, with but little lead and some antimony.

CHLORIDE HILL.

On this hill the best developed mines are, San Joaquin and Chloride Jim. The ores are principally chlorides on this hill.

FOOTHILLS ON EAST CANON.

The Green Chloride and Philadelphia groups of mines are located here. The ore is high grade, and rich in chlorides and sulphurets.

DRY CANON.

On the East side, known as "Jacobs" and

the Snow Storm hills is the celebrated Mono mine which carries so large a percentage of gold in its ores; also the Congress, Utah, Queen, Miami, Ida Edna, Wild Tiger, Chance, Kearsarge, Magnolia, Fourth of July, Alabama, Wandering Jew, Scottish Chief and Evening Star.

The ore are high grade, sulphurets, bromides, with but little lead. On the

FOOT HILLS

Are the Rip Van Winkle, Baltic, Lowland Chief, and Green Chloride Flat mines. The ores are high grade argentiferous.

There is a fair division of ores in the district—one half being milling and the other smelting. The former are on the West side and the latter on the East side.

Camp Floyd District

Is situated on the western slope of the same range of mountains, about 60 miles distant from Salt Lake City. It was organized early in the Spring of 1870.

The principle mines in the district are the Silver Cloud, Sparrow Hawk, Comstock and Mineral Point.

The Sparrow Hawk is owned by an English company. There is a 20-stamp mill belonging to the property.

Other mines are partially developed and give good promises, among them are the Mormon Chief, Queen of the West and Elkhorn.

The ores of this district are chiefly milling, with general combinations in connection, considerable horn silver occurring. The lodes are principally stratified, and occur mostly in limestone formation.

A second mill is in process of erection at Fairfield on the road from Lehi to Eureka, about seven miles from Lewiston, for the purpose of working custom and purchased ore; the owners of the mill are mostly interested in mining claims in the district. Cinnabar has been discovered in the district and a recent assay showed 5.24 per cent. in quicksilver.

East Tintic District

Is situated in Tintic valley, about 74 miles southwest of Salt Lake City. The core of the upheaval, traversing Utah from northeast to southwest, runs through this district, flanked on each hand by lime formations.

The district was located in the fall of 1870. Following are the names of the principal mines:

EUREKA CITY.

The Eureka, an extensive, valuable and well developed mine, with smelting works attached. And midway between

EUREKA AND SILVER CITY

The Mammoth and the Mammoth Copperopolis are situated, and the latter is owned by an English company. This mine is at the present time the leading one of the district. The preparations in the shape of buildings and accommodations for an extensive mining business are on a grand scale. The ore from it yield a large percentage of copper, silver and gold and the return of shipments to Swansea have averaged in some instances from \$200 to \$300 per ton.

In consequence of the prevalence of silver ore, in many cases with free gold visible, it is contemplated to erect a mill, and a location has been secured at a comparatively short distance from the mine and work is expected to commence at an early day. On the dump there are several hundred tons of good milling ore.

In addition are the Swansea, Chicago, Diamond and North Star, the Highlander Consolidation, comprising the Highlander; Highland Lass, Helena, Josephine and Storm King lodes, also the Empire Tunnel.

There are also the Black Dragon and Snnnham mines. Contiguous to

DIAMOND CITY

Are the Joe Bowers, Shower, Morning Glory, the Diamond Silver Mining Co's group, the Joe Lane, Norwegian and Rising Sun.

The ores in this district are principally milling, with occasional smelting. The greater part of the body of ledge matter is quartzite, containing the chlorides, carbonates and sulphurets of silver, with argentiferous lead, in some instances, also frequently a considerable percentage of copper and some gold, as for example in the Mammoth and Copperopolis lodes.

The veins or lodes are mostly of a fissure character, and are found in limestone, quartzite, porphyry and granite.

About six miles in a westerly direction from Diamond and Silver Cities a new stamp mill is being constructed by a California Co., on what is known as Tanner's Ranch. This mill is expected to be completed and in operation early next spring. The movement will greatly facilitate mining operations in that district.

Ohio District.

This district, commonly known as the Sevier District, is on the Sevier river about two hundred miles below Salt Lake City. It was organized in 1869. The principal mines are the Webster and Bully Boy, both of which have very large surface showings.

There are also the Yankee Blade, Eclipse, Morning Star, Niagara, Rothschild, Great Western and Gould & Curry. The ores of this district are free milling.

Lincoln District.

Formerly called the "Pioneer," is situated four miles north of Minersville, Beaver county, and about two hundred miles southwest of Salt Lake City.

The Pioneer district was organized in 1864, and its name changed to Lincoln District January, 1871.

In this district the Mormons commenced

working the old Spanish lead mine as far back as 1554, which has since been named the Rollins lode.

The other principal mines in this district are the Quinoy, Alameda, Wahsatch, Lewis, Grundy, Creole, Galena and St. Cloud.

The ores of this district are principally Galena.

Salt District,

230 miles south of Salt Lake City, was organized in the fall of 1870. There is a plentiful supply of wood and water for mining and domestic purposes. The principal mines are the Taylor, St. Mary, Maxwell, Mars, Pitney, Pacheco, Rubie, Frank, Bibbins, Harrisburg, Gus Gates, Tiger, Rhine, Wilber, Elephant, Jupiter, Big Mormon, Sbauteer, Flora, Temperance, Empire, Washington, Hickory, Rebel, Shenandoah and Hope.

The ores are principally of a milling character.

Mineral Point District

Is situated 16 miles from Brigham City and distant 18 miles from Brigham, on the Utah Northern Railroad. This district is receiving much attention from capitalists on account of the immense deposits of iron, which mineral is pronounced better than that found in Lake Superior, the appearance and analytical properties being very similar. The Idaho iron mine shows large bodies of rich iron ore, and is the only mine on which developments have been made to any extent.

The foregoing comprises a list of the leading developed mining districts. Some recent and valuable discoveries have been made, and districts organized in other portions of the Territory, which are in process of development, and will, in due course, take their rank among those of acknowledged value and importance.

Among the latter may be named the

Granite District,

Sixty miles west of Ophir district, organized in the summer of 1872.

The formation is granite, and the croppings stand boldly out and can be traced in some instances over 1,000 feet.

The ore carries much iron, with galena and copper and iron pyrites; also, fine matrix quartz.

Beaver Lake District,

About 25 miles south of Salt Lake City, is a promising district. Four mines are in process of development, viz.: The San Francisco, Fairview, Big Mountain and Teemseh.

The character of the ore is galena, chloride, black sulphurets, carbonate, and occasionally horn silver is found in limited quantities.

Still further north are the North and South Star, and the San Francisco districts, all spoken well of, but not yet sufficiently developed to warrant the details concerning them.

USEFUL INFORMATION.

Philosophy in Extinguishing Fires.

It has been remarked that while fire apparatus has been constantly improving, no progress has been made in the method of attacking a fire. On this point, Rev. Dr. Hill, not long ago President of Harvard College, has this to say:

Nearly everybody is in daily need of kindling fires; but few have ever need of quenching a fire. Hence most people know that fire spreads by heating adjacent fuel, and that, in heating adjacent fuel, the heated air and burning gases of the fire are much more efficient agents than the radiant heat; in other words, that to get a fire to spread rapidly it must be lighted at the bottom or to windward, or where a lateral draft may be created by the fire; while few people know that to quench a fire the same principle is generally available, and the quenching is most rapidly effectual if it can be begun at the lower part of the fire or at windward, or where a draft strikes it.

"Of course in a great conflagration it is often impossible to avail oneself of these facts, but at the beginning, while the fire is confined to one or two houses, it can generally, unless there be gunpowder or benzine in the building, be subdued by a resolute plucky adherence to the maxim 'Play low.' When a building is well on fire and pouring a stream of flame and burning cinders out of its roof, the temptation to play on the roof is very great, and a majority of firemen yield to it; but the minority who resist the temptation, and direct their streams into the lower story of the building, presently have the satisfaction of putting out the fire. If the gas pipes under a mass of burning ruins be open or broken, the effectual remedy is to shut off the gas in the main pipe. The blazing roof is the burning gas, the gas is generated from the heated timbers, the heat generating it is from the burning stories below, the wind currents carrying the blazing cinders to adjoining roofs are produced by the same heat below; quench that lower story, and you have put out the fire at the gas factory and cut off the supply of gas, and the steam from that quenching has also gone up and deadened the fire even to the roof.

TAME CODFISH.—Mr. Buckland, in a recent number of *Land and Water*, gives an interesting account of a visit paid by him to a pond containing tame codfish at Port Logan, Wigtownshire. The property in question belongs to a gentleman by the name of McDougall, and consists of an amphitheater about one hundred feet in diameter hollowed out of the solid rock by the sea. All egress from this is prevented by a barrier of loose stones, through which water passes freely. On approaching the shore of the pond many codfish of great size were seen; and when a servant woman who had charge of the fish approached with some mussels; the surface of the water was perfectly alive with the struggling fish. They came close to the edge, and after a little while permitted Mr. Buckland to scratch them on the back, and play with them in various ways. Among other experiments tried by him was that of holding a mussel in his hand, and allowing the fish to swallow his hand in the effort to obtain the mussel. These fish furnish to the proprietor an ample supply of excellent food, the flavor being considered much superior to that of the cod taken in the open sea. Whenever needed for the table, a selection can readily be made from the most promising of those on hand, and the fish secured without any difficulty.

To PRESERVE POSTS.—A writer in the *Western Rural* says: "Take boiled linseed oil and stir in pulverized charcoal to the consistency of paint. Put a coat of this over the timber, and there is not a man who will live long enough to see it rotten. I discovered many years ago that wood could be made to last longer than iron in the ground, but thought the process so simple and inexpensive that it was not worth while making a stir about it. I have taken out basswood posts that have been set seven years, that were as sound when taken out as when first put into the ground. Time and weather seemed to have no effect on them. The posts can be prepared for less than two cents apiece. They should be well seasoned before the oil and charcoal are applied."

TEA IN IOWA.—Iowa is jubilant, for within her borders a new agricultural treasure hath arisen. This is tea, which has been cultivated in Crawford county up to the point of 700 pounds to the acre! It is said that the person in charge of the plantation, after making many experiments in many States, found that the climate and soil of Iowa best suited the plant, and that it would and could endure thrivingly the coldest of her weather. No wonder the State is jubilant. We await with interest, for further developments, well assured that if tea can be grown with profit in Iowa, we shall by and by make a good business of it in California.

DICKENS'S AMERICAN READINGS.—By far the most profitable lecturing tour on record is that made by Dickens in this country, from Dec. 24, 1867, to April 20, 1868, in which time the great novelist gave 76 readings, to audiences averaging 1,500, the average net proceeds amounting to \$3,000, giving him a fortune of \$228,000 in what may be regarded as a simple holiday excursion of five months. His smallest house was at Rochester, which gave him \$2,500, while his largest house yielded him \$6,000. Mr. Dickens was listened to in America by 114,000 people. Who wouldn't be a reader?

TO PROTECT LEATHER FROM THE ACTION OF AMMONIA IN STABLES.—Long continued observations show that harness and other leather exposed to the action of ammonia continually given off in stables become weak and rotten sooner than other leather. Even when care is taken to protect them with grease this takes place. Prof. Arles recommends the addition of a small quantity of glycerine to the oil or fat employed in greasing such kind of leather, assuring that it keeps it always pliable and soft.

MEASURING THE HEIGHT OF TREES.—When a tree stands so that the length of its shadow can be measured, the height of the tree may be readily ascertained as follows:—Set a stick upright near the termination of the shadow of the tree. Mark the extremity of the shadow of the stick and also of the tree. Then as the length of the stick's shadow is to the length of the stick, so is the length of the tree's shadow to the height of the tree.

A GIGANTIC NETTLE.—They have a stinging nettle in Australia, which grows 40 feet high, and has a stem over two feet in diameter. By the way, we believe no botanist has yet been able to make it clear what office the nettle has assigned to it in the economy of nature, or why it is guarded with fine needles, as though more precious than other plants. As nothing was made in vain, a purpose was certainly contemplated. What is it?

ONE POUND OF TEA contains about a third of an ounce of theine, two and a half ounces of caseine, one twelfth ounce of volatile oil, and two and a half ounces of gum, half an ounce of sugar, half an ounce of fat, four ounces of tannic acid. Mineral matter or ash, water and woody fibre make up the remainder.

HERE AND THERE.—A comparison of the extremes of noonday temperature in Philadelphia and San Francisco during the month of July, brings out with great clearness the remarkable uniformity of the California climate. In Philadelphia these extremes were 69 and 98 deg., while in San Francisco they were 60 and 69 deg.

WATER IN FRUIT.—Apples, pears and peaches contain eighty-two to eighty-six per cent. of water, and most other fruits nearly the same. Grapes contain nearly twice as much as currants, three times as much as raspberries, five or six times as much as apricots and peaches.

GOOD HEALTH.

How a Man Feels when He is Full of Strychnine.

Dr. Harris, an assayer residing at Gold Hill, Nev., recently came very near being poisoned to death through taking a dose of medicine for rheumatism. The following communication from him tells the story: Last night I felt a pain in my knee, caused by rheumatism. I got up at 10 o'clock and took a dose of rheumatism medicine prescribed by Dr. Toland of San Francisco. There was only one dose left, and not at the time thinking of the sediment at the bottom of the vial, I took it. Half an hour after, as I was lying in bed with a candle in hand reading, I was struck senseless and speechless.

The candle fell on the bed, and I could neither stir nor cry out for a second. Luckily the shock terminated in time to let me put out the light, or the house and all would have been consumed. More and stronger shocks and convulsions then followed, and from the symptoms I knew that I had taken strychnine. My wife brought sweet oil, of which I took two doses. But great God! what a torment! Shocks and convulsions followed from half-past ten to twelve o'clock, when the death throes set in. I was convulsed, and felt five shocks like a man broken on a wheel, and the last shock made me helpless and stiff. I felt the earth give way, and called my wife to me.

My hands were crossed, but I could not move them, nor any part of my body. I bade them all good-by and swooned. My wife sent the children for a doctor, and Dr. Kirby came about 12 and found me still alive and somewhat rational, as the oil had its effect. From then until 6 o'clock this morning I had shocks like from a galvanic battery every few minutes. I could not stir hand or foot, and any attempt to turn my head brought a shock. To tell what I suffered is impossible, and I had given up all thoughts of life; but soon I began to recover; and now, 10 o'clock A. M., I am able to write you this, in order that you may warn persons using this medicine to beware of overdoses or settings.

Broken Hearts.

The advances of pathology demolish for us some of the most beautiful illusions of ancient times. The heart, for instance, is degraded from its position as the high altar of devotion and affection, to a mere hydraulic machine. The liver no longer plays its old role in melancholy, to which it gave the name. It makes simply some bile and some sugar. The eye, after all, is only a system of lenses, and refracting media of different densities, and so on, of all the rest; but in the course of still further and more extended observation became evident the close connecting links between these organs and the presiding brain, which explains to us the intimate relationship which exists between heart; expression then still lingers in the eye; hypochondriasis still has its frequent seat beneath the cartilages of the ribs, and the heart still throbs and palpitates under the various emotions. Bernard has explained to us in detail the full significance of the cold and empty heart, the heart that is light or heavy, the heart that is full to bursting, and last of all, the heart that breaks outright. The great batteries of the cerebral mass send special lines of innervation to the heart, and though the communication between the heart and brain are not so swift—being only at the rate of 112 feet per second, as electricity, yet its force and volume are even more intense. The broken heart, then, is no mere poetic fiction, and several instances are recorded where rupture of its strained or more especially diseased fibers, has taken place under powerful mental emotion.

THE CUTICLE OR SCARF SKIN.—As the scarf skin has no blood vessels running into its substance it has no means of self-repair; so that in proceeding from the deeper layers to the surface the cells go through all the processes of birth, death, decay, and dissolution, though the membrane is so thin. Since, also, this skin has no nerves entering it, it has no sensation, and the sensation of touch must be felt through it in the same way—though in a much more perfect manner—as we feel anything which touches us through our clothing. It will be seen, then, that it must fit very accurately and closely to the sensitive skin beneath, or the sense would be dull and imperfect. The skin below has an immense number of small hillocks, and each one of these is closely surrounded by, and inclosed in, the inner layer of the cuticle which is moulded upon them. When the cuticle is stripped off, after being long soaked in water, it shows an infinite number of small pits, out of which the hillocks or papillae have been dragged. If the whole be torn away before maceration—i. e., from the living skin—it usually tears away the papillae with it, leaving a bleeding surface.

FLIES CONVEY INFECTION.—Professor Kletinsky, of Vienna, is reported to have microscopically detected epithelial cells and pus-globules adhering to the bodies of flies which had lit on small-pox patients, thus justifying the belief that these insects may convey infection.

Drinking too Much the Cause of Kidney Disease.

Five-sixths of an animal body is made up of water. A man weighing two hundred may be dried into a mummy not weighing but sixteen pounds, including bones of the skeleton. Water, therefore, is largely employed in giving form, flexibility and beautiful lines. Enough is taken in with food to meet all demands of the system. The precise quantity, and indeed quality, is regulated by a sense of thirst. But that vital sentinel may be corrupted by excessive indulgence. When simply water is taken, a morbid thirst never follows. If, however, stimulating fluids are swallowed a morbid craving may be generated, which if not restrained, may become an unsatisfied passion, to the positive injury of organs on the regular functions of which sound health depends.

There is danger from indulging in artificial drinks. Nature distills them over in the stomach by her own chemical process, separating the water from them, which is used for legitimate purposes, but rejects all the rest, throwing it out of the body through the kidneys and skin. By working the renal apparatus beyond a normal gauge, to carry off offending elements, they fall into disease beyond the resources of medicine.

This explains a prodigious advance of Bright's disease—that is, a degeneration and loss of ability in these organs to do what they must accomplish for stability in health. None of the lower animals have kidney diseases, because they never drink to excess or burden the stomach with compound beverages.

Sir William Gull on Typhoid Fever.

In a recent lecture on typhoid fever at Gny's Hospital, Sir William Gull remarked that two hundred and fifty years ago one of the kings of England died of ague, but now by improved agriculture and drainage the disease had become rare, and certainly very few die of it. Typhoid fever, he asserts, is as preventable as ague, and two hundred and fifty years hence deaths from it will be as rare. The disease is caused by a virus of nature, which may get into the healthy body, increase in it, and destroy it. It is an accidental condition, and not one of the ordinary processes of nature. The origin of the disease is somehow or other connected with drainage; it has therefore been called the filth fever, and to get rid of the filth is to get rid of the fever. This was illustrated in the case of the Milbank prison, where typhoid and dysentery were once thoroughly established, but where both almost wholly disappeared when the water-supply was changed and efficient drainage provided. In his closing remarks on the treatment of the disease, the lecturer said that no one can approach a case of typhoid fever without paying some attention to hygiene. This he claimed was of the greatest importance, and with it he would prefer to carry any one through the disease by wines and soups and fresh air, rather than by the use of drugs.

BURYING ALIVE.—A Paris paper challenges the world to produce one authentic case where a person has ever been buried alive. It adds that such stories are all bosh. Notwithstanding the above, we are inclined to believe that persons have, not unfrequently, been consigned to the grave before life was extinct, though the number of cases in which this has been done are probably very much fewer than is generally supposed.

A German physician recommends that whenever there is any doubt in regard to life having departed, that a string should be tied tightly round a finger or a limb of the person supposed to be dead, when, if life is absolutely extinct no change whatever will take place, but if there is the slightest vitality remaining, the flesh above the string will become a bluish red, being surcharged with blood, carried to it by the arteries, and which the string prevents the veins returning to the heart.

LIE DOWN AND REST.—Dr. Hall says the best medicine in the world, more efficient in the cure of disease, than all the potencies of the materia medica, are warmth, rest, cleanliness and pure air. Some persons make it a virtue to brave disease, to "keep up" as long as they can move a foot or crook a finger, and it sometimes succeeds, but in others the powers of life are thereby so completely exhausted that the system has lost all ability to recuperate, and slow and typhoid fever sets in and carries the patient to a premature grave. Whenever walking or work is an effort, a warm bed and a cool room are the first indispensable steps to a sure, and speedy recovery. Instinct leads all beasts and birds to quietude and rest, the very moment disease or wounds assail the system.

SASSAFRAS LEAVES FOR BOILS.—Seeing a friend sorely afflicted with boils a few days since reminded us of the Sovereign virtue which sassafras leaves, pounded into a sticky paste and applied as a poultice, possess. The writer has tried the remedy on his own person and applied it to persons of others in many instances, and never knew the poultice to fail in drawing the most obstinate boil to a "head" within twenty-four hours. I am aware that the sassafras tree is rare in California, but that is no reason why any nurseryman should not introduce it, and our people cultivate it extensively. The bark of the root is an article of commerce and the tree is useful and ornamental. H.

Death of Professor Rankine.

The well-known and eminent, mechanical and scientific engineer, Prof. W. J. Macquorn Rankine, died at Glasgow, Scotland, January 24th, after a brief illness. Only two or three hours before his death he penned a brief communication to the monthly meeting of the Institution of Engineers. He died of heart disease. Dr. Rankine died in the prime of life, having only reached his 53d year. He has been a hard thinker and worker, and his death was no doubt hastened by his unceasing labor. He was a man of wonderful intellectual attainments, and few who have ever lived have been able to get through with such an immense amount of study and work as was his daily practice. His acquaintance with the literature of physical and mechanical science was perfectly marvelous. The contributions to science which he has left are ample to secure for his name an imperishable record, as one of the foremost of modern philosophers.

WHITE FISH.—We have received from Kelloggville, Lake Co., a note from Mr. Livingstone Stone, in relation to the experiment of introducing the White-fish of the great American lakes to the lakes of California. He says: "The hatching works for the State, White-fish eggs, at this place, are completed, and are well located. I am expecting the eggs every day. The United States will present the State Board of Commission with 400,000 ova, which will be placed in Clear Lake, when hatched."

We hope a portion of these will be put into Lake Tahoe, a much larger, deeper and colder body of fresh water than Clear Lake.

HORSE DISEASE.—A correspondent of the Salt Lake Herald at Little Cottonwood says the epizootic will have a serious effect on the mines, and will be the means of stopping the regular monthly dividends of the Flagstaff and Emma.

TERRIBLE EXPLOSION.—By the simultaneous explosion of four boilers at the American Iron Works, Pittsburg, Pa., on the 3d inst., seven men were killed and over thirty wounded.

Proposed Mining Legislation.

Coal Lands.

A bill has been introduced in the House of Representatives by Mr. Kendall entitled "A bill to encourage the discovery, exploration and working of coal veins or beds upon the public lands of the United States," and provides for the purchase of coal lands by the discoverer at the rate of \$5 per acre. The maximum area of land to be embraced in the claims is limited to 160 acres for one person and 640 acres to any association. If the lands are not paid for in one year from the date of the location they are subject to relocation. The bill has not yet become a law. As the law stands now no matter who the discoverer may be, the lands must be put up at public auction and sold to the highest bidder. The Nevada people wish that exceptions be made in the case of their State and a resolution has been presented to the Legislature asking it to memorialize Congress to except Nevada from the operation of the law now in force. The memorial has been published in the Territorial Enterprise and it is hoped that proper attention will be paid to it. It represents that on account of the increasing scarcity of wood for fuel in Nevada, particularly near the Comstock mines, unless relief be found by the development of coal mines within the State, gold and silver mining will be seriously embarrassed, and attended with expense rendering the working of low grade ores unprofitable. That on account of the existing laws previously referred to, prospecting for coal has almost entirely ceased, since the discoverers have no more right to the locations than any one else, as the lands are sold at public auction at a minimum price of \$20 per acre. The memorial asks that the laws shall be modified so that the discoverers can pre-empt and purchase. Mr. Kendall's bill, if passed in the Senate, will cover all this ground.

There is no place on this coast where a good supply of coal is needed as much as at the Washoe mines, for the wood is very scarce. Nearly 600 cords a day are shipped from Carson to points on the Virginia and Truckee Railroad, which barely suffices to keep the mills and hoisting works running. The Gold Hill News says that the Ophir hoisting works consume 13 cords a day, or 4,750 cords per year. The Gould & Curry burns 16 cords a day, or 5,840 per year, and other hoisting works in proportion. They are now adopting the plan of using wood and coal together which is said to effect a considerable saving of the former. Now that Utah is turning her attention to coal mining she may be able to supply the deficiency, but if the laws referred to above, are passed, prospecting in Nevada will commence and the latter State will probably be able to produce enough for home purposes. Storey county alone will use about 300 tons a day. Utah is the richest in coal of any of the adjoining Territories as far as known, but Nevada may be able to compete with her, in this respect, if the country is fairly prospected.

"The Protection of Miners."

The bill introduced in the Nevada Legislature by Senator Phelan for the "Protection of Miners," and now before the Committee of Mines and Mining, is given as follows in the Enterprise:

SECTION 1. Whenever complaint, duly verified by oath of complainant, is presented to a District Judge, setting forth that the lives, limbs or health of the miners working in or about any mine, within the judicial district, are exposed to unnecessary hazard by reason of inefficient or defective machinery, want of proper ventilation, the storing of powder, or erection of steam engine or privy in the mine, or from any other cause whatever, the District Judge shall appoint some competent person as commissioner to examine such mine.

SEC. 2. The commissioner shall proceed at once to said examination, and report, in writing, to the District Judge forthwith, the result thereof. If said commissioner shall find the complaint true, or shall find that the lives, limbs or health of such miners, aside from that set forth in the complaint, are subjected to unnecessary hazard, he shall suggest in his report the most expeditious and cheapest mode of correcting the evil, and the District Judge shall, by written order, directed to the owner or owners or the agent in charge of such mine, require the correction of to be corrected in the manner set out in said report.

SEC. 3. If the owner or owners, or the agent to whom such order is directed, shall fail to comply with such order as soon as practicable, he or they shall be fined by said judge in any sum not less than one hundred dollars nor more than five hundred dollars.

SEC. 4. The commissioner shall be allowed the sum of twenty dollars for each examination and report, to be paid by the owner or owners of such mine, in case the commissioner shall find just cause of complaint; otherwise his compensation shall be paid by the complainant or by the county, as may be directed by the District Judge.

SEC. 5. If the District Judge shall find that the complaint is presented in bad faith, or malice, he shall fine the complainant in any sum not less than twenty-five dollars nor more than one hundred dollars.

SEC. 6. The sheriff of the county shall execute all orders of the District Judge, and all orders shall be enforced, and all fines collected as provided by law for the enforcement of orders of courts of justice and the collection of fines.

It ought to be to the interest of large companies to provide proper means of exit in

case of fire, ventilate the mine, store the powder safely, and keep their hoisting works, etc., in a proper condition without being compelled by law; and in fact most of them recognize this, if not for common humanity's sake, for the reason that they do not wish to be held liable for damages. The engineers have to trust their own persons in the mine and to their machinery, and would hardly permit anything dangerous about it if they knew of it, and when such things are pointed out, they have a personal interest in its being promptly remedied. The miners are good judges of danger in their work and would be very likely to complain. Legislation in this case is hardly necessary, but as the Enterprise justly remarks, "while there is no harm in the bill we doubt that its passage would do anything toward furthering the humane purposes of the measure."

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on the 3d inst., when the following new members were elected: Rev. W. A. Scott, F. H. Waterman, Wm. E. Brown. The Hon. Charles E. De Long, U. S. Minister to Japan and Albert Bierstadt, the artist, were elected corresponding members.

Donations to the Cabinets.

A number of books were presented to the Academy by Mr. Hector, Geologist of New Zealand. A peculiarly made arrow from Kotzebue Sound was presented by Agapin Honehar-enko. The head of the arrow was apparently poisoned; Dr. Dall said they were used by the natives in Alaska for killing seal. They allow a deer's liver to rot, and make from it something which is supposed to be poisonous.

Specimens of ore taken out in the tracing done on account of the lawsuit between the Raymond & Ely and Kentucky mine were presented. They were crystallized carbonate of lead and hydrous oxide of iron. The Frog Found Alive in a Mine.

At Mount Diablo, recently, was presented by Mr. Cornwell, President of the Black Diamond Coal mines. It was a frog, not a toad. The President stated that frequently on former occasions it had been reported that frogs or toads had been found hundreds of feet below the surface alive; but inquiry had failed to ever recover the matrix in which it was embedded, and until such is found, scientific men must think that it either fell down the shaft or was put thereto mislead them. No identified case of a frog having been so found was reported. Mr. Cornwell, who presented the specimen, stated that it was found at a depth of 228 feet in the mine, by the men while engaged in picking, not blasting, and they allege that they picked it out. The frog lived about twelve hours only after it was taken out. When Mr. Cornwell visited the mine two days after, he tried to procure the pieces from which he was taken but did not succeed. The rock is a soft sand rock. The man who found the frog says it was in a solid place that he struck his pick in and out struggled the frog and after a moment moved about in a lively manner.

Professor Davidson said there were no cases where the matrix had been found. A gentleman had told him however, that once in Pennsylvania he had seen a frog taken out and he also seen the matrix.

Mr. Dall called to mind, from the proceedings of a scientific association, some experiments where an English gentleman had tried how long a toad could live in this manner. A slab of stone was taken and a number of holes cut in it and in each was placed a toad, previously carefully washed and weighed to ascertain the exact weight. Then a glass was put over each hole and fastened on with Portland cement. The slab was buried in a garden and not taken up for some time. On being examined it was found that where the cement was perfect the toads were dead. Those in the holes where the cement had cracked were still alive. The slab was buried again and not taken up for three years. At the end of that time three were found to be alive. The holes were examined and it turned out that the cement had cracked in each instance undoubtedly and, perhaps had let in some small insects, for one toad weighed more than when he was put in.

R. E. C. Stearns read a paper entitled "Remarks on a supposed new Alcyonoid Polyp from Burrard's Inlet. This was in reference to "willow wands," or supposed "notocords" of a fish, which was under discussion last year. Mr. Stearns illustrated his remarks with diagrams.

Dr. J. M. Wiley made some remarks on some points of interest in connection with the deposits of auriferous gravel in Placer County, which we will give in a future issue.

W. H. Dall, of the U. S. Coast Survey, presented descriptions of three new species of *Delphinus* from the Coast of California, viz.: *Delphinus Bairdii*, *Tursiops Gilli*, *Grampus Stearnsi*.

Miscellaneous Business.

Dr. Kellogg presented and described new plants as follows: *Grindelia Lilifolia*, or varnish cup, collected by Mr. W. G. Harford, of the U. S. Coast Survey, on Santa Rosa Island; *Lupinus*

Seluhus, or stool lupin, found at Donner Lake; *Lupinus luteus*, or milk-white lupin, collected by Samuel Brannen Jr.; *Lupinus luteolus*, or pale yellow lupin, found by the Doctor on Suñol mountains; *Stephanomeria (?) intermedia*, found at Cisco by Meesre, Brannen and Kellogg; *Pentstemon Kingii*, variety *glauca*, or King's Beard, tongue found by Dr. Kellogg on the Sierras at an altitude of 8,000 feet. *Garrya Veatchii*, collected by the late Dr. J. A. Veatch on Cerros Island.

Iron Sands.

At the last meeting Dr. Stout made some remarks on the iron sands which he presented, and since then Professor Davidson had been examining this sand, and had taken portions apparently non-magnetic, broken them up and found they were still magnetic. He found that nearly all would come to the magnet by being careful and even some of the refuse sand, most of which contained particles of iron ore. He examined some of the specimens from the Chil-eat River, to which he had before referred, and found that they were all magnetic iron. Some of it went as high as 72 per cent. and some as low as 20 per cent. iron. When the lumps were crushed it all yielded magnetic iron, showing that disintegration alone would give the reason of its formation. The Secretary read an extract from an article by T. Sterry Hunt, in the *American Naturalist*, confirming Professor Davidson's remarks as to the formation by disintegration. The action of the waves by virtue of the greater specific gravity of these sands, effects a process of concentration, so that considerable layers of nearly pure black sand are often found on the shores exposed to winds and tides.

Railroad Building.

The San Joaquin Valley Narrow-Gauge Railroad will probably now be constructed without doubt. Articles of incorporation of a company for that purpose were filed on the 3d inst., with a capital of \$1,600,000 in shares of \$100. It is called the San Joaquin and Tulare Narrow Gauge Railroad Company. B. W. Bours is President, and T. K. Hook Treasurer. The Trustees are B. W. Bours, T. K. Hook, George F. Smith, C. M. Grattan, R. C. Sargent, of San Joaquin County; A. Leach, of Stanislaus County; Charles M. Bleir, of Merced County; H. C. Dalton, of Fresno County; R. E. Hyde and E. Jacob, of Tulare County; Ed. F. Northam, of San Francisco. This will be one of the most important roads in the State, and be of the greatest benefit to the localities through which it passes. It is said that subscriptions are coming in at a lively rate and already nearly all the first ten per cent. required by law has been paid in.

Montana is in her turn, beginning to think of building railroads. Her comparatively isolated position has been a great drawback to her progress as all the goods carried there have to be transported for long distances by teams, greatly increasing their cost, and lessening the quantity. The population is small as yet, but with the great mineral advantages of the Territory alone, if proper means of communication were available, her prosperity would be doubled. The people are anxious to have railroad connection with this city and desire a road to connect with the Pacific for that purpose. This company to build a broad-gauge road from Corinne Utah, to Helena Montana, are now making strenuous efforts to commence the work. A bill has already passed the lower House, granting right of way for a road from Helena, to some point on the Pacific road. When the principal town of Montana has direct railroad communication with this city it will be of great benefit to our foundry men and merchants, if proper steps are taken to get the trade of the Territory.

The Pioche Record has private advices from Salt Lake to the effect that parties intend commencing active operation in the construction of the contemplated narrow-gauge road to Elko.

The celebration of the opening of the Utah Northern Railroad to Logan has been interrupted by the storms, the guests being unable to proceed over the line.

An effort is being made by the property owners near Berkeley, Alameda county, to establish a ferry and railroad to run direct from San Francisco via, Jacob's Landing, to the University grounds. The subscriptions are said already to exceed three-quarters of the sum needed.

A project is on foot to build a narrow-gauge road from Contra Costa county to Oakland, which would furnish a direct and economical outlet for the products of the numerous valleys of that county, and of the Mount Diablo Coal mines.

The Marin county narrow-gauge road will shortly be built, as contracts have already been awarded for construction. Ground will be broken immediately and the workmen employed. This road runs from Sausalito northward, and will probably be extended further than is at present anticipated.

Improved Safety Hoisting Cages.

The hoisting works in some of the deep mines on the Comstock lode are not only extensive but very expensive pieces of work. The engines, machinery, etc., are well made, heavy, safe and durable and every care is taken to prevent accidents. The construction of the cages is light and simple, differing from those in use in Europe. There they are arranged to receive several cars either on separate platforms or two or three abreast when the shaft is wide enough. They are very cumbersome, and made of iron, some of two stories high. On this coast we have some of two stories which are in reality only one cage over another. Most of those in use are however only one story high. The cars are loaded and hoisted with their load to the surface, instead of by the old way of shoveling ore into a bucket and hoisting it, as the former method is the most simple and saves re-handling the ore, time and labor. All the Comstock, and the principal mines of the Coast that have vertical shafts use the cage, and with heavy loads of from 5,000 to 8,000 pounds they can hoist from 500 to 1,200 feet a minute. The United States Mining Commissioner in his last report gives a cut and description of a safety cage, an illustration of which will be seen in the accompanying cut. The manner in which the cages, work though simple to those accustomed to them, will be interesting to the general reader.

A compartment of the shaft is fitted with vertical stringers, or guides of wood or iron, extending from the top to the bottom which serve to guide the movement of a platform cage, into which the car can be placed. The platform is fitted with rails the same gauge as the track, and the car is run upon these and secured by bolts. The platform is a little smaller than the compartment of the shaft, and forms the bottom of a framework of iron, by which it is suspended. The frame rises above it on each side and connects with a cross piece above the car, to which the hoisting cable is attached. The platform and frame work together form the cage. By means of projecting ears, or bars of iron or steel rubbers on each side, at the top and bottom, which partly embrace the guides, it is kept from contact with the sides of the shaft, and this slides freely up and down, the only friction is between the rubbers and the guides, and this friction in precisely vertical shafts is of course very slight. The shaft becomes in fact a vertical railway, and is a continuation of the tramways, below uniting them with the distributing tracks above. Trimming and hoisting thus become a continuous operation. A car load of ore is rolled from the levels and drifts to the bottom of the shaft and placed on the platform, the signal is given to the engineer above and the load starts on its journey.

The construction of the cages is very simple, being usually a square plank platform with a track, upon which the car stands, and suspended by a kind of stirrup frame of iron at each side to an arched cross-bar of iron at the top, through the center of which the suspension rod passes freely, and is firmly bolted just below to a second iron cross-bar free to move up and down in slots made in the frame on each side. This second cross-bar is connected at its two ends by arms on the outer side of the frame with the lever ends of dog-clamps or safety catches. The construction will be readily understood by referring to the cut, which gives a side view of the most approved form of the cage and catches now in use in the Comstock mines. The platform *P. P.* is five feet long and three feet eight inches wide. It is surmounted by a hood *H. H.* of boiler iron, firmly secured by binges to the tops of the frame and designed to protect the miners from falling bodies. The height of the cage from the top of this hood to the bottom of the platform is eight feet. The ends of the rubbers are seen at *R. R.* and at *O. O.*; the clamps or safety catches at *C. C.*; and the arms *A. A.* connecting these with a cross piece above, *O. O.*

A safety hook *S.* for detaching the cage in case of over winding, is placed at the top and turns in the head of the suspending rod. When the cage is at rest in the bottom of the shaft, or wherever it is not suspended by the winding cable, the cross-bar *B. B.* and cross-piece *O. O.* are pressed downward by a long and powerful steel plate spring, and this throws the points of the catches *C. C.* into the sides of the guide timber, and not into its face, as is the case with Fontaine's and other safety catches. During hoisting or lowering the spring is compressed and this tends to relieve the cage from the

shock which attends a sudden commencement of hoisting. The hand lever just above the platform controls iron rods which rise through the floor and hold the cars securely in place during the ascent and descent of the cage. This sort of cage is very light and gives general satisfaction. It is not closed in at the top or sides as closely as in the foreign mining cages, and is high enough to allow the men to stand upright. The hood is hinged to prevent the imprisonment of miners in case of accident, or drowning, if, as sometimes happens, the cage is lowered into the sump. These cages are generally hoisted by flat wire rope most of which is made by A. S. Hallidie & Co., in this city. The dimensions of these flat cables are 3 by 1/2 inch to 6 by 1 1/2 inches for iron, and 2 1/2 by 3/4 inch to 4 by 1/4 inch for steel.

Improved Bolt Cutter.

We give herewith an illustration of an exceedingly simple and effective device for cutting off the ends of bolts or bars in positions where it is not possible to bring the work to a shop, and it is especially applicable to the work of cutting off bolts in various parts of a ship, where they may project too far after fastening. The illustration shows a pair of stout ways, *A*, about two and a half feet long. At one end of these ways a steel cutter, *C*, is secured, and a movable cutter, *B*, slides to and

CHAPMAN'S IMPROVED BOLT CUTTER.

from the cutter *C*, on the ways *A*, the edges of the cutters facing each other. A connecting rod, *F*, is pivoted to the cutter *B* at one end, while its other end is pivoted to the nut *K*. A similar rod, *G*, extends from the nut to an adjustable block, *H*, at the end of the ways opposite the cutters. A screw, *E*, passes through

IMPROVED SAFETY HOISTING CAGE.

the nut *K*, and turns loosely without advancing in the slide *D* in the ways below. By means of a lever, *L*, the screw *E* is turned and thus moves the nut *K* down, and by means of the rods *F* and *G*, forces the cutters together so as to sever anything which may be placed between them. The block *H* is made adjustable by means of a screw, *I*, so as to accommodate the machine to larger or smaller bolts. In order to prevent the sliding block *D* from becoming cramped or bound by the advance of the nut *K* and screw *E*, towards the cutters when in operation, a connecting rod, *J*, is pivoted to the block and also to the centre of the rod *F*, as shown, and this ensures a parallel movement of the block *D*, so that it is always kept in line with the nut. This ingenious device is the invention of Mr. Leonard J. Chapman, of Vallejo, and has recently been patented through the MINING AND SCIENTIFIC PRESS agency. It promises to be exceedingly useful, and parties desirous of using the machine would do well to consult Mr. Chapman.

Lecture on Zoology.

The third lecture of the Polytechnic course was delivered in the upper hall of the Mechanics' Institute, on Saturday evening last, by Dr. George Hewstou. The Doctor announced that this was the first of a course of ten lectures which he proposed to deliver on this subject.

He began his remarks with a brief review of the commencement of animal life, following it up through all its various phases to the present time. He dwelt upon the different classes, making careful comparisons and illustrations, which portion of his remarks was listened to with marked attention by the large audience present. He spoke of the deep interest which attaches to the study of zoology, its usefulness, and its beneficial effect upon the mind, and of its recent introduction, as a study, into institutions, which have for centuries ignored it as a profitable branch of education.

The speaker alluded to the usefulness of the study in the way of mental training. He said it would instruct and elevate the mind, and raise up for the student, friends on every hand, to whom he was before a total stranger. The little inhabitants of the field, wood and beach, will all become objects of intense interest to

him. He will know their structure, their genera, their objects and habits. Moreover one cannot properly study nature without being led to look up through nature, to nature's God.

We regret that want of space will not admit of a full report of this interesting and instructive lecture. The Doctor has a happy style of presenting his views, and consequently enchains the attention of all. He spoke for about an hour and a half, during which time the audience did not lose interest in his remarks, and at the close they appeared well pleased.

STORMY WEATHER.—For the past week we have had abundant rains all over the State of California, and the "lower country" has been especially benefited. The large amount of snow which has fallen on the Sierra Nevadas, will serve to keep the streams full late in the coming summer, and will be of great value to the placer miners. The storms in the mountains of Utah and Nevada have been severe. At Pioche about 8,000 pounds of silver bullion had accumulated since the stoppage of the Salt Lake stages. The snow blockade in the mining cañons of the Wasatch range in Utah is very serious, and some distress even is expected among miners needing food. The bad condition of the roads prevent supplies coming forward freely, and work in many mines is totally suspended. At Little Cottonwood, Utah, the snow is 12 feet deep, in level places and the roads are impassable. The Utah Northern Railroad is still blocked. The Davenport, Flagstaff, Union, Utah and Grizzly and other mines have reduced their working force. Large quantities of ore are on the dumps, and the winter there is more severe than the last.

Heavy storms have occurred on the Atlantic, and on the English Coast have caused considerable loss of life and property. The cold in the East is unprecedented, and even in this State it has been unusually severe. Snow can be seen from this city on the hills across the Bay, which is an exceptional occurrence. In San Diego, Santa Barbara and Los Angeles a good supply of rain has fallen, enough, according to the local papers, to ensure good crops. The prospects for both miners and farmers for the coming year are excellent throughout the State, and our million yield, as well as the quantity of wheat raised, will be greater than usual.

NEW MAIL FACILITIES.—Service on the new mail route from Hardyville, via Mineral Park, Cerbat and Chloride to Arizona, was to have commenced January 20th. This will be of great benefit to residents in those remote mining districts.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Feb. 4th, 1873.

FOR WEEK ENDING JANUARY 21st, 1873.

ROTARY CULTIVATOR.—James W. Milroy, assignor to self, Wm. R. Michener and C. L. Howard, Haywood, Cal.
OYSTER TONGS.—Isaac Smith, Bruceport, Washington Ter.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

EUREKA CONSOLIDATED.—Another controversy is going on about the Eureka Consolidated mine and the stockholders want to know why no dividends have been paid when the mine is in so prosperous a condition. It will be remembered that last year there was considerable complaint against the managers about a reported scandalous charcoal contract, and a reported contract given for hauling ore above rates which could have been made. A correspondent of the *Virginia Chronicle*, in a letter to that paper states that the superintendent's reports show that from two to four furnaces have been running continually, the bullion proceeds from what must have been from \$120,000 to \$130,000 per month and yet no dividends have been paid. Stockholders in Virginia think that if they had been fairly treated they would have received a dividend of \$2 per share for the last six months. One report current is to the effect that the Trustees are purchasing this stock in the interest of an English Company and that the affairs of the company have been purposely mismanaged to depress the stock by disgusting the shareholders. It is generally understood that the Richmond Consolidated Company, who are engaged in a litigation with the Eureka Cons. Co., have bought about 24,000 shares of the stock of the latter at the present low rates. A long time has elapsed since the first complaints were made against the way affairs have been managed and there seems to have been no improvement even since the change in management. The stockholders desire, and justly too, that the trustees make an exhibit of the affairs of the company and explain why no dividends have been paid and where the money has gone to.

DEATH OF LIEUTENANT MAURY.—The distinguished astronomer and hydrographer, Matthew Fontaine Maury, died at Lexington, Virginia, on the 1st inst. He was the author of several works, among which may be mentioned the "Physical Geography of the Sea," and one on Navigation. He was astronomer to the South Sea Exploring Expedition under Commodore Jones, and was at one time in charge of the depot of charts and instruments, which served as a nucleus for the National observatory and Hydrograph office of the United States, of both of which he became Superintendent. His labors in organizing the observations as well as his investigations in connection with the winds and currents of the sea are familiar to all. The King of Prussia presented him with a gold medal, and the Emperor of Austria gave him the large gold medal of the Arts and Sciences as a recognition of his services. He has been living in retirement for some time.

SKILLED LABOR.—The *Salt Lake Tribune* very sensibly believes in the employment of able professional men about mining property, and cites the results achieved by the Germania company as an illustration of the success attending the employment of professional men and skilled labor. Men who are thorough masters of their business should be employed only. The *Tribune* says that experience has demonstrated that the majority of failures in smelting are to be attributed to lack of necessary skill at the start.

CALIFORNIA PIONEERS.—At the last meeting of this Association an attempt was made to extend the time of membership to September 9th, 1850, but the "49ers" carried the day, so the rules remain unchanged.

THE GLOBE ROLLING MILLS in Cincinnati were burned on the evening of the 4th inst.; loss \$70,000.

Laws Under New California Code—Taking Effect Jan. 1, 1873.

(Continued from page 74.)

[False certificate, report, or notice to make officers liable.]

316. Any officer of a corporation who makes or gives a certificate, official report, public notice, or entry in any of the records or books of the corporation, concerning the corporation or its business, which is false in any material representation, and who knew or had full opportunity to know the same to be false, is liable for all the debts of the corporation contracted while he was a stockholder or officer thereof; and if more than one violate the provisions of this section in concert, they are jointly and severally liable.

[Meeting by consent to be valid.]

317. When all the stockholders or members of a corporation are present at any meeting, however called or notified, and sign a written consent thereto on the record of such meeting, the doings of such meeting are as valid as if had at a meeting legally called and noticed.

[Proceedings at meeting to be binding.]

318. The stockholders or members of such corporation, when assembled, may elect officers to fill all vacancies then existing, and may act upon such other business as might lawfully be transacted at regular meetings of the corporation.

[Meetings where held.]

319. The meetings of the stockholders and Board of Directors of a corporation must be held at its office or principal place of business.

[When no provision in by-laws for regular meetings, special meetings, how called.]

320. When no provision is made in the by-laws for regular meetings of the Directors and the mode of calling special meetings, all meetings must be called by special notice in writing, to be given to each Director by the Secretary, on the order of the President, or if there be none, on the order of two Directors.

[Liabilities of stockholders. They may be released, when.]

322. Each stockholder or member of any corporation is severally, individually, and personally liable for such proportion of all its debts and liabilities as the amount of stock or shares owned by him in such corporation bears to the whole of the subscribed capital stock or shares of the corporation, for the recovery of which joint or several actions may be instituted and prosecuted; and in any such action against any of the stockholders or members of a corporation, the Court must ascertain and determine the proportion of the debt which is the subject of the suit for which each of the stockholders or members who are defendants in the action are severally liable, and judgment must be given severally in conformity therewith. If any stockholder or member of a corporation pays his proportion of any debt due by such corporation, he is released and discharged from any further individual or personal liability for such debt. Stock held as collateral security, or by a trustee, or in any other representative capacity, does not make the holder thereof a stockholder, but the pledgor or person or estate represented is the stockholder.

[Certificates, how and when issued.]

323. All corporations for profit must issue certificates for stock when fully paid up, signed by the President and Secretary, and may provide, in their by-laws, for issuing certificates prior to the full payment, under such restrictions and for such purposes as their by-laws may provide.

[Transfer of shares.]

324. Whenever the capital stock of any corporation is divided into shares, and certificates therefor are issued, such shares of stock are personal property and may be transferred by indorsement by the signature of the proprietor, or his attorney or legal representative, and delivery of the certificate; but such transfer is not valid, except between the parties thereto, until the same is so entered upon the books of the corporation as to show the names of the parties by and to whom transferred, the number or designation of the shares, and the date of the transfer.

[Transfer of shares held by married women, etc. Dividends payable to married women.]

325. Shares of stock in corporations held or owned by a married woman may be transferred by her, her agent, or attorney, without the signature of her husband, in the same manner as if such married woman were a *femme sole*. All dividends payable upon any shares of stock of a corporation held by a married woman may be paid to such married woman, her agent, or attorney, in the same manner as if she were unmarried, and it is not necessary for her husband to join in a receipt therefor; and any proxy or power given by a married woman, touching any shares of stock of any corporation owned by her, is valid and binding without the signature of her husband, the same as if she were unmarried.

[Non-resident stockholders. Bonds.]

326. In all transfers of shares of stock in corporations, on behalf of owners residing out of the State, the President, Secretary, or Directors of such corporation, before entering such transfer on the books of the corporation or issuing the certificate therefor to the transferee, must require from such attorney, or from the person claiming under such transfer, a bond of indemnity, with two sureties, satisfactory to the officers of the corporation, or, if not so satisfactory, then approved by the District Judge of the district in which the principal office of the corporation is situated, conditioned to protect such corporation against any liability to the legal representatives of the owner of such stock, in case of his or her death before such transfer; and in case of refusal to furnish such bonds upon request, such transfer is utterly void as against the corporation.

Corporate Powers.

[Powers of corporations.]

354. Every corporation, as such, has power:

1. Of succession, by its corporate name, for the period limited; and when no period is limited, perpetually;
2. To sue and be sued, in any Court;
3. To make and use a common seal, and alter the same at pleasure;
4. To purchase, hold and convey such real and personal estate as the purposes of the corporation may require, not exceeding the amount limited in this Part.
5. To appoint such subordinate officers or agents as the business of the corporation may require, and to allow them suitable compensation;
6. To make by-laws, not inconsistent with any existing law, for the management of its property, the regulation of its affairs, and for the transfer of its stock;
7. To admit stockholders or members, and to sell their stock or shares for the payment of assessments or installments.
8. To enter into any obligations or contracts essential to the transaction of its ordinary affairs, or for the purposes of the corporation.

[Limitation of powers.]

355. In addition to the powers enumerated in the preceding section, and to those expressly given in that Title of this Part under which it is incorporated, no corporation shall possess or exercise any corporate powers, except such as are necessary to the exercise of the powers so enumerated and given.

[Banking expressly prohibited.]

356. No corporations shall create or issue bills, notes, or other evidences of debt, upon loans or otherwise, for circulation as money.

[Misdemeanor does not invalidate instrument.]

357. The misdemeanor of a corporation in any written instrument does not invalidate the instrument, if it can be reasonably ascertained from it what corporation is intended.

[Corporation to organize within one year.]

358. If a corporation does not organize and commence the transaction of its business or the construction of its works within one year from the date of its incorporation, its corporate powers cease. The due incorporation of any company, claiming in good faith to be a corporation under this Part, and doing business as such, or its right to exercise corporate powers, shall not be inquired into, collaterally, in any private suit to which such de facto corporation may be a party; but such inquiry may be had at the suit of the State on information of the Attorney-General.

[Increasing and diminishing capital stock, how.]

359. Every corporation may increase and diminish its capital stock, as in this section provided:

1. By a majority vote of the Directors there may be called a meeting of the stockholders, to be convened for the purpose of increasing or of diminishing the capital stock;

2. Personal notice of the time and place of such meeting, and the object thereof, must be served on each stockholder resident in this State; or, in lieu thereof, the notice must be published in every issue of a newspaper published in the county where the principal place of business is located, for four weeks successively;

3. The notice must also contain the amount to which it is proposed to increase or diminish the capital stock;

4. The capital stock must in no case be diminished to an amount less than the indebtedness of the incorporation or the estimated cost of the works which it may be the object or purpose of the corporation to construct.

5. At least four-fifths of all the capital stock must be represented at such meeting, and at least two-thirds of the entire capital stock must vote in favor of such increase or diminution before the same is effected;

6. A certificate, signed and verified by the Chairman and Secretary of the meeting, must be made, showing a strict compliance with all the requirements of this section, the amount to which the capital stock has been increased or diminished, the amount of stock (and by whom held) represented at the meeting, the vote by which the object was accomplished, the amount of capital stock actually paid in, and the amount of all debts and liabilities of the corporation, and how secured;

7. This certificate must be subscribed by a majority of the Directors, and duplicates made, one to be filed in the office of the County Clerk and one in the office of the Secretary of State, as provided for original articles of incorporation, and thereupon the capital stock is so increased or diminished.

[Corporations may acquire real property and how much.]

360. No corporation shall acquire or hold any more real estate than may be absolutely necessary for the use of the business conducted or the construction of their works, except as specially provided. A corporation organized for any purpose specified in Subdivisions 3, 4, 5, 7, 8, and 15, of Section 286, may acquire real property as provided in Title VII, Part III, CODE OF CIVIL PROCEDURE, when needed for the uses and purposes therein mentioned.

To be Continued.

A Vast Hydraulic Mining Claim.

The Messrs. Hendricks in Morris Ravine, have a vast mining claim of excellent pay dirt, with the best appliances, and water to work it. The extensive gravel deposit into which their 2,500 inches of water, under several hundred feet pressure is cutting its way, is unmistakably of the same character as the deposits at Cherokee, and will not fail to be equally as remunerative. Their mining flume, which lies deep down in the bed rock at the claim, extends down the ravine for the distance of a mile or more, is 4 feet in width, of firm and substantial structure, and paved with rock. It is their design to extend the flume down the ravine to Feather river, a short distance above Oroville, and opposite river claim of '57, known as the famous Cape claim. It was the theory of the speculator then that the rich deposits found in the famous Cape, were washed down Morris Ravine from the deposits underlying Table Mountain. Morris Ravine, itself was one of the rich and famous surface mining ravines of '49 and '50, and strengthened the theory of the river deposits. The ravine, from its confluence to the claim of Messrs. Hendricks, has been little more than skimmed off, while such claims as the Monte De Oro, and those of Rigby, and Boyd high up on the mountain sides of the ravine, show that the whole formation is a deposit of auriferous earth. The ravine itself shows evidence of having only been slightly scratched over, while the claims above referred to having been worked successfully for years, yet seem to be nothing more than mere scars on the mountain sides. Doubtless a much greater impression could have been made on those huge deposits, but for the small amount of water afforded by the water-shed of Table Mountain, and some of them, (the Monte De Oro for instance,) being situated so high on the side of the mountain as to afford but very little water during seasons of the greatest rainfall.

The Messrs. Hendricks appear to have mastered the situation so far as a supply of living water for their own use is concerned, by the construction of a ditch some fifty miles in length, taking water from the West Branch of the Feather river, conveying it across depressions in huge iron pipes and around the mountain sides in ditches. This large ditch carrying 2,500 inches of water winds around the hills in the vicinity of Cherokee with tantalizing placidity to the miners of Cherokee whose rich claims lie idle a good portion of the year for want of the flood of water that runs at their very feet, but the ditch was not calculated for that altitude, and it gracefully curves from their view, clinging to the crumbling sides of the North Table Mountain, until it debouches into a vast reservoir at the head of Morris Ravine. From thence it is carried in pipes under several hundred feet pressure, to the claim. Here a distributor divides the current into 3 pipes to each of which is attached a hydraulic chief, which hurls 800 inches of water against the face of the claim with great and irresistible force, before which the earth melts away, and even the bed-rock is torn up and thrown high in the air, shivered to atoms and whirled away down the flume by the rapid current. These hydraulic chiefs are operated each by a single man, and, after the flume is laid, and the mountain loosened with powder, do the work of mining.

On a recent flying visit to this claim, we witnessed the power of one of these monitors, in cutting a passage through the bed-rock for the flume. It was stationed above the head of the flume, and hurled 800 inches of water through a 5-inch nozzle on to the bed-rock in the direction of the head of the flume, cutting its way through the rock with the apparent precision and ease of a gardener's spade in yielding

soil, and almost with the rapidity of electricity. It is but recently these vast arrangements have been perfected on this claim. Indeed the large 4-foot flume is not yet completed to the face of the claim, and it will be but a short time, before the claim of Messrs. Hendricks will equal, if not excel, any other hydraulic mining operation in the State. Blasting tunnels have been run into a mountain almost as large as one of our Buttes, which will soon be shattered by a blast, fired by electricity, the buildings in the vicinity being barricaded by planks, to protect them from the falling debris. The hydraulic chief, under the direction of a single man will do the balance of the work. Much coarse gold is found on the bed-rock in their claim. A piece weighing over 4 ounces was picked up the morning of our visit. The Messrs. Hendricks have expended a large sum of money in making these extensive preparations for mining, and will soon realize a hundred fold.

There are many pleasant residences and vineyards nestled in the sheltered nooks of the mountains along Morris Ravine, and around the lower Table Mountain, giving promise of future wealth and happiness, when the miner has worked away the deposit of pay dirt. The drive up Morris Ravine, and around the lower Table Mountain to the valley road leading to Chico, is a pleasant one, over a good road, and will not fail to show the two great resources of Butte, viz: Mining and Agriculture, while 3 or 4 miles beyond lies Cherokee with its untold millions of gold dust on deposit, and numberless diamonds waiting to be unearthed, that they may reflect back the genial light, and double the happiness of the toiling miner, and make glad the household of the present husbandman.—Oroville Record.

Mines and Bullion Product of Nevada.

A correspondent of the Sacramento Record quotes from the report of the Nevada State Mineralogist as follows: "The bullion product of Nevada, 1872, equals almost one-half all the bullion produced west of the Missouri river. In the State there are no less than 162 mining mills and furnaces, and 1,904 stamps, capable of reducing daily 5,183 tons of ore. The gold and silver product for 1871 was \$20,010,175.12, while in 1872, estimating the last quarter, it is \$23,619,212.09, with several thousand tons of lead, copper and antimony."

Bus. —Twenty-two trains are now running on the Virginia and Truckee Railroad (Washoe), and one track appears to be inadequate to accommodate the immense freighting business. The G. & H. Hill News says that to keep these trains from hitting each other is a matter of no ordinary difficulty. The men engaged in running the trains make four trips a day, and find they have very arduous labor to perform.

LARGE SHOP.—The largest smith's shop in the world has been added to the other wonders of the Royal Arsenal at Woolwich. It is about 200 feet in length by 120 in breadth, and contains 72 forges, several furnaces, and the foundations for six steam hammers—one of 70 cwt, one of 20 cwt, two of 15 cwt, one of 6 cwt and one of 5 cwt.

KENTUCKY is to have a State geologist, with two assistants, to make a complete geological, mineralogical, and chemical survey of the State.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:

Building Fronts, Water Pipe

Sinks, Monuments, Fountains,

Tiles, Copings for Walls,

Filters, etc., etc.,

Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.

The attention of private parties intending to build is respectfully solicited.

Office, No. 10 BUSH STREET, San Francisco.

EUCALYPTUS.

The attention of the Medical profession is respectfully called to the following preparation of this new remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of intermittent and Marsh Fevers, often supplanting the use of Quinine. The paroxysms of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the medicinal effects of the leaves of Eucalyptus Globulus.

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves in a palatable form and elegant appearance. Dose—One tablespoonful, to be repeated as often as the case demands.

Cigarettes of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc. Prepared and sold by JAMES G. STEELE & CO., Chemists and Apothecaries,

No. 521 Montgomery St., between Clay and Commercial, San Francisco. n28

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE

Caution Against Fraud.

The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed. Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester, Cross & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-1f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

Richardson & Co., Copper Ore Wharves, SWANSEA.

RICHARDSON & Co. have been for thirty years established in Swansea as Agents for the preparation, Sampling, Assaying, and Sale of Copper, Silver, Gold, Lead, Zinc, and all other Ores and Metals, for which they have extensive Warehouses and Wharves under cover, 1,500 feet of Quay Frontage within the Floating Dock, and the most complete Machinery and Appliances. They are also prepared to make advances against Ores in anticipation of realization, and to guarantee all payments when required. 17v21-1y

Mining Company's Report.

Raymond & Ely.

The annual meeting of the Raymond & Ely Mining Company was held Jan. 28th. All the old Trustees were re-elected except L. A. Booth, who declined a nomination, and Henry Raymond was elected in his stead. The Secretary reports that the ore worked at the mills during the year have yielded over 75 per cent. of the pulp assay. The two mills, 20 and 30 stamps, are in good condition and the completion of the railroad between Pioche and Bullionville will greatly reduce the cost of transportation. The Lightner shaft in the mine is now down 623 feet—7th level—and they are still sinking it. In this shaft above the 7th level there are 24,000 tons of ore assaying \$125 per ton; and there are 4,000 tons of the same average value in the Creole mine with over 12,000 tons of third-class ore on the dumps. The following is the Superintendents summary of operations for the year:

Ore on hand at beginning of year, tons.....	1,907
Ore extracted during the year.....	30,369
Total.....	32,276
Ore shipped to mills.....	20,874
Ore reduced at mills.....	23,626
Ore on hand at mills.....	600
Ore on hand at the dumps.....	13,193

In the Secretary's report are some interesting items. The mine has only been in operation about two years, and since March 1871, it has paid as dividends to Stock holders the sum of \$2,635,000, including the December dividend. The dividends in 1871 averaged \$20.50 per share, and \$69 in 1872; and were at the rate of 55 per cent of the gross receipts in 1872, against 46 per cent in 1871. The bullion production in 1871 was \$1,361,590, against \$3,693,936 in 1872. The total dividends have been as follows:

1871.....	18,72
January.....	\$90,000
February.....	150,000
March.....	300,000
April.....	30,000
May.....	210,000
June.....	210,000
July.....	30,000
August.....	30,000
September.....	45,000
October.....	120,000
November.....	150,000
December.....	150,000
Totals.....	\$2,635,000

The Secretary's report gives the following account of the receipts and disbursements:

RECEIPTS.	
From bullion.....	\$3,693,936
Superintendent's drafts not presented.....	18,005
Miscellaneous.....	7,473
Total receipts.....	\$3,719,414
Cash, per previous report.....	64,681
Total.....	\$3,784,095

DISBURSEMENTS.	
Lands, claims and titles.....	\$49,781
Law expenses.....	48,386
For mining.....	558,700
For milling.....	410,463
Hauling ore to mills.....	162,944
Mine improvements.....	3,890
Mill improvements.....	14,110
Completion of mill.....	26,550
Taxes.....	80,494
Dividends.....	2,070,000
Discount on bullion.....	55,563
Advance to Nevada Central Railroad.....	100,000
Insurance on mills.....	7,322
Office salaries.....	7,200
Miscellaneous.....	8,668
Outstanding drafts paid.....	30,521
Total disbursements.....	\$3,635,517
Cash, January 28, 1873.....	148,578
Total.....	\$3,784,095

Following is a statement of the assets and liabilities of the company:

ASSETS.	
Improvements at mines.....	\$34,525
Stores at mines.....	12,354
Ores on dumps.....	640,146
Mills, etc.....	198,109
Stores at mills.....	100,517
Ores at mills.....	33,600
Tailings at mills.....	670,960
Advanced to railroad.....	100,000
Office furniture.....	1,844
Cash on hand.....	148,578
Total.....	\$1,941,571

The only liabilities consist of the Superintendent's drafts advised, but not presented, amounting to \$18,005. As will be seen from these figures, this mine is one of the most prosperous on the Coast, and has steadily paid dividends since operations were first begun. The management has the confidence of stockholders and carry on business in their interest.

Belcher.

The annual meeting of the Belcher Mining Company was also held on Jan. 28th. As a general result the mine has spent \$300,000 in construction, paid as dividends to stockholders \$2,184,000 and increased its surplus on hand from \$712,945, to \$1,023,301; out of the latter amount the January dividend of \$312,000 was paid, leaving \$711,301. The cost of mining was \$9.07 per ton, and cost of crushing \$12 per ton. The average yield of the ore was \$57.63 per ton. The Secretary's report is as follows:

RECEIPTS.	
From bullion.....	\$4,791,629
Virginia.....	5,230
Total receipts.....	\$4,796,859
Cash January 1, 1873.....	712,945
Total.....	\$5,509,804

DISBURSEMENTS.

Labor account.....	\$560,509
Crushing 83,195 tons ore.....	998,341
Hoisting ore.....	83,534
Mine extension south.....	124,184
Mine extension north.....	31,458
Wood and coal.....	63,141
Timber and Lumber.....	113,353
Assaying.....	150,829
Taxes.....	37,262
Exchange and discount on bullion.....	63,217
General, legal and office expenses.....	25,310
Treasure and other freight.....	55,537
Construction.....	21,782
Salaries at Gold Hill.....	8,750
Dividends to Stockholders.....	2,184,000
Supplies.....	13,865
Cash in hands of Supt.....	12,474
Cash January 1, 1873.....	1,011,124
Total.....	\$5,512,834

COST OF PRODUCING AND REDUCING 83,195 TONS ORE.

Crushing, per ton.....	\$12 00
Mining, per ton.....	9 07
Total cost, per ton.....	\$21 07
83,195 tons produced \$1,794,659 10; per ton.....	57 63

Net, per ton.....	\$36 55
The bullion report is as follows:	
Bullion, gold value.....	\$3,087,948 55
Bullion, silver value.....	1,706,710 54
Total.....	\$4,794,659 10

Among the expenses included in the \$21.07 per ton per cost of producing and reducing 83,195 tons was \$83,000 paid to the Yellow Jacket Mining Company for hoisting ore before the connection was made between the Belcher shaft and the levels.

THE STANFORD MILL at White Pine, which has been idle for some time, will start up as soon as the condition of the road will admit of ore being hauled.

San Francisco Metal Market.

PACIFIC MINERAL LAND OFFICE—HOTY, SEARS & McKee—MERCHANTS' EXCHANGE, CALIFORNIA STREET, SAN FRANCISCO, CAL.—Mining Patents obtained for claims in California, Nevada, Utah, Arizona, and elsewhere. Plans and papers prepared for adverse claimants, as required by the new law; re-locations effected where claims have lapsed under the Congressional Act of May 10, 1872; Mining Contests conducted before the Departments and Courts.

Mr. McKee's experience as Chief of the Mining Claims Division, General Land Office, Washington, D. C., will be valuable to parties desiring to properly appear either as claimants for patents or as adverse claimants. Cases attended to in person at any of the District Land Offices, or at the Departments at Washington, where deemed necessary. JAS. T. HOYT, W. H. SEARS, O. H. McKEE. 1725-3m

WONDERFUL CURE.—A young man, a resident of this city, gives us the facts of the following remarkable cure. He says: "I suffered with Catarrh in its worst form. Bones came from my nose; my breath became offensive; I was compelled to eat alone; I had given up all hopes of being cured. At this time I met Dr. E. V. E. of Chicago, who had been cured by a remedy discovered by himself. I tried the remedy, with little faith; but at the end of three months found myself cured." Our informant has now associated himself with the discoverer in the manufacture of the article, which will be known under the name of the Diamond Catarrh Remedy. Price 50 cts.; sent by mail for 60 cts. A. F. EVORY, CO., No. 9 Post Street, San Francisco. Sold by all druggists. 25725-3m

A NEW BOOK ON MINING.

The Explorers, Miners and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying and Metallurgy, The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, \$10 (in coin); in leather, \$12. Forwarded by mail, in cloth, \$11.40, currency; in leather, \$13.75. Issued and for sale by DEWEY & CO., Patent Agents and Publishers Mining and Scientific Press, S. F.

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine.

—ALSO—
HAMMERED IRON

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.
The highest price paid for Scrap Iron. 9v143

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. G. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1m, 1am1f

GEO. W. PRESCOTT. C. W. SCHEIDEL. W. R. ECKART

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Sketch of Delaney's New Patent Cushion.

DESCRIPTION OF ENGRAVING.
E, pin or regulator, extending into rail; D, steel wire,
tending from pin into and through rubber cushion; B, rub-
ber cushion; C, is end of rubber cushion; A, lining.
Their construction is of the simplest kind, thus making
no heavy expense for supporters' laboration. The im-
provement is a steel wire running lengthwise, and commu-
nicating with a pin at each end and inside of the rail;
the wire is imbedded in the rubber cushion, near its edge of
surface. The pin mentioned is controlled and operated
upon by a key, regulating the tension of the wire, accord-
ing to the necessities of the case. It keeps the edge of the
cushion straight and sharp. It prevents the rubber hard-
ening from the impingement of the ball; and, above all
other considerations, the angles are bound to be perfectly
correct.
The ball never jumps from the table, however severe the
stroke. It makes no noise when leaving the cushion.
Nine cushions are made upon our tables with the same
degree of force requisite to make six up in any other.
These unrivalled cushions are self-protective, and will re-
tain their elasticity either in hot, cold, dry, or damp weather,
almost forever.
Thousands of Delaney's cushions have been introduced
throughout California and the Great West, where the
largest billiard manufacturers now make exclusive use of
them, to the eminent satisfaction of their patrons.

BROWN'S PATENT LAMP. PACIFIC LAMP MANUFACTORY.

For Mills and Hydraulic Mining Claims.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.

Mr. C. B. Brown—Sir: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,

W. D. APLIN.

Little York, Nov. 5, 1872.

HALLIDIE'S Patent Endless Wire Ropeway. Covered by Numerous U. S. Patents.

IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.
T. M. MARTIN—My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiberg.
It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ore requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah.
Superintendent's Office, Sept. 23, 1872.
T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

EMMA HILL CONSOLIDATED MINING CO.,
Superintendent's Office, Oct. 23, 1872.
T. M. MARTIN, Esq.—Sir: With pleasure I testify to the fact that the endless wire Ropeway (HALLIDIE'S PATENT) built by you for this Company, has been for a month or more in daily operation, and has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,
WM. O. CAMPBELL, Clerk of Co.

The Vallejo Ropeway.
The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by three iron towers. The fall in this distance is about 60 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or barrels. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.
A. S. HALLIDIE, Patentee,
112 and 114 California Street, San Francisco.
Wire Rope for hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest rates.

The Ewbank Ventilator.

(Written for the Press by A. BLATCHLEY.)

Our engraving represents the Ewbank ventilator applied to a mine, and an enlarged view on the left side of the engraving of the junction of the exhaust pipe of the steam engine and the upper end of the ventilating pipe. Unlike ordinary ventilators this one operates by suction, and is applicable only to mines which have a steam engine at the mouth of the shaft, or in its immediate vicinity.

This ventilator has no valves or wheels, and is simply a pipe extending from the point in the mine from which it is desirable to draw off the hot air to the mouth of the exhaust pipe of the steam engine, as shown in the cut. When the engine runs, the ventilator operates without any other power than what is otherwise lost in exhaust steam; when the engine is not running, of course the ventilator ceases acting. The pipe, which can be made of light sheet iron, or even of wood, if made air tight, should be as large as feasible—the larger the pipe the less the friction, and care should be taken to avoid sharp angles and to lay the pipe in a straight line as nearly as possible.

In placing this ventilator in a mine, the end of the pipe where the hot air enters, must be above or beyond where the workmen operate, as is shown at A, and H. A pipe placed, as shown in the cut, would cause a current of air to pass from the shaft along the drift and up the winze to H. If it could be laid along the dotted line H, H, it would work more efficiently, but it usually has to be applied as shown in the cut. If it is placed as shown at D, it will draw up all of the fresh air which comes from the shaft, and the hot air from the opening above, and make the drift hotter than it was before the ventilator was put in. By elevating the end of the pipe into the opening above, the current of fresh air from the shaft will be increased by the amount of hot air passing out of the ventilator.

This was tried in one of the hottest and deepest mines in Washoe where a large amount of old workings were connected with the place where the miners were at work; a Root blower was used to supply fresh air, and before the ventilator was put in, it served to cool the drift so that the miners could work; but after the ventilator was introduced, it drew up not only all of the fresh air from the blower, but drew the hot air from the old workings, so that in a half hour the miners had to quit the drift.

At A, A, is shown the upper end of the ventilating pipe with the exhaust pipe from the steam engine passing through it. According to Ewbank the enlargement and contractions of the pipe shown in the cut are essentially necessary to its successful working, especially the contraction at the mouth of the exhaust pipe. It is probable that for pipes of small size the cylindrical form is as good as any, but for pipes of more than one inch in diameter the effect would be greatly increased by flattening both pipes at the upper end of the exhaust pipe, as for instance, reducing a circular pipe of four inches in diameter to one inch in one direction and nearly sixteen in the other. This would increase its power as twelve is to thirty-four.

In a large exhaust pipe only the steam near the sides of the pipe produces any useful effect, while the great body of steam in the center of the pipe produces no effect.

As this ventilator is self-acting, or uses power that otherwise would be lost, and is so simple that any one can make and put it in a mine, and as it has an enormous capacity it ought to come into general use in all deep and extensive mines,

Foundry Work.

The Fulton Foundry of this city is at work on the iron work for the new building of the London and San Francisco bank, which will be erected on the corner of Leidesdorff and California streets. There are in this job about 275 tons of castings and the work is all to be finished like a piece of machinery. There are 70 odd columns which are to be turned in a lathe and when finished will not look at all like an ordinary house front. The building will probably be the finest one yet erected in San Francisco. There are to be three stories and a basement, and the portions which front on California and Leidesdorff streets will all be made of iron. The carving alone on the patterns will cost upward

At the Vulcan Foundry which is now well under way again, they are doing considerable repair and sawmill work. They are making a steam engine, shafting, gearing, etc., for the Golden Gate Flour Mill, and also casting two water gates for the San Mateo Water Works. A cylinder, piston, etc., 16 inches in diameter and 42-inch stroke is being made for an engine at the Gould & Curry mine; also a steam pumping engine 12x24 for a mine in Calaveras county. They are doing the iron work on two of Hays' patent fire escapes for the Kimball Carriage Manufacturing Company, one of which goes East and the other will be used here. A number of moulds are being made for the Selby lead works, at which place they have considerable refuse metal unfit for ordinary purposes,

EWBANK'S METHOD OF VENTILATING MINES.

of \$2,000. The entrance, judging from the plans, will be very handsome. There are two figures, 7 feet high, in the position in which we usually see Atlas depicted, except that instead of a World, they support heavy ornamental carved work of a fanciful character, which holds up the corner of the building. A pair of lions, between which is a shield, are placed over these, above which are heavy iron columns the length of each separate story. This turning off castings and finishing them up like machinery is a new wrinkle and one which everybody can not afford to indulge in. It will take about six months to finish the iron work.

At this foundry they are also making two Brodie Crushers to go to Mexico, and have just shipped to the same place, a 5-stamp mill all complete with three Varney pans and one settler. They are building an engine 16x36 for F. P. and J. A. Hooper at Trinidad, and making castings for settlers and drying kiln for the Monitor-Belmont Mining company.

which they intend making into sash weights. These five moulds will contain six weights at a time. Some car work and repairing is being done for the Central street railroad in this city.

NARROW-GAUGE.—A Portland (Oregon) dispatch says: Articles of incorporation have been filed by the Narrow-Gauge Railroad Company for the purpose of building a narrow-gauge railroad between Tillamook and some connecting point with the Oregon Central Railroad near the north end of Winter Lake.

Reliable information received in Elko confirms the report that 25 miles of iron has been purchased in New York for the Eastern Nevada narrow-gauge railroad to Pioche, a portion of which will arrive next week. The survey commences as soon as the weather will permit.

OREGON COAL.—The Seattle Coal Company's mine ship an average of 130 tons of coal per day. It is estimated that this year Bellingham Bay will ship 30,000 tons. We want all we can get.

Efflorescence of Silver.

The following interesting paper on the efflorescence of silver was recently read before the San Francisco Microscopical Society, by Guido Kustel, the well-known mining Engineer and Metallurgist. Mr. Kustel remarked: There is a peculiarity observable in some silver minerals, principally of sulphurets, when small particles are melted into a globule on charcoal before the blow-pipe. After being melted to a perfectly spherical form, the blowing is stopped, and the globule will appear coated with crystalline metallic silver on cooling. The minerals exhibiting the phenomenon are the following: silver glance, selenide of silver, enciarite, stephanite, brittle silver ore (melanglance) margyrite and rich fahlerz. The petzite (from Melone's mine), although amongst the silver minerals, emits only the pure gold in shape of microscopical globules before the mineral melts. Under the microscope the efflorescence of silver appears wonderfully beautiful, but the interesting part in it is, that different minerals show a different aggregation of silver particles on the surface of the globules; and so characteristic that in most instances there is no difficulty in recognizing the mineral from the specialty of the crystalline silver and color of the globule in a minute's time. Only minerals rich in silver emit it, generally over thirty per cent., but not all. Antimony prevents the appearance of silver. So, for instance, margyrite would not show any silver until the antimony was driven out by longer blowing. Rapid cooling, by touching the globule with a needle or some other metallic instrument, increases or creates the efflorescence.

The different appearances of the silver, as observed under the microscope, is about as follows: Silver glance shows isolated round flowers, like stars, often crowded together. Silver-copper glance (stephanite), if very rich (fifty per cent. silver), exhibits almost the same characteristics; poorer specimens emit the silver in a shape resembling fine moss. Both minerals give dark steel-blue globules. The last mineral, with copper largely prevalent, coats the globule with copper, which oxidizes on the surface, causing a dull, rough appearance. Melanglance gives a lead-grny, lustrous globule, showing, if cooled forcibly, from the touching point, long radial threads adhering to the surface of the globule. Selenide of silver makes long, beautiful crystalline leaves. Enciarite (selenide of silver and copper) emits the silver in isolated, thick, upright threads, like the natural silver threads. Margyrite, after the antimony is blown off, displays brilliant rainbow-colors during refrigeration; forcibly cooled, it throws out silver, resembling silver drops that fall in a melted condition on a floor, assuming a flat shape.

SAN FRANCISCO MICROSCOPICAL SOCIETY.—The annual meeting of this growing Society was held last week, when the annual election took place. Among the presentations was some infusorial earth containing rare forms of diatoms. The new seal of the Society was presented and adopted. A resolution was adopted increasing the limit of membership to fifty, on account of the number of applications. The following officers were unanimously elected for the ensuing year: Henry G. Hanks, President; Arthur B. Stout, M. D., Vice-President; C. Mason Kinne, Recording Secretary; Henry C. Hyde, Corresponding Secretary; D. P. Belknap, Treasurer.

A WOOLEN MILL is shortly to be erected at Windsor, Sonoma county, Cal.

Auriferous Gravel in Placer County.

Dr. J. M. Willey, at the last meeting of the California Academy of Sciences, read the following remarks on some points of interest in connection with the deposits of auriferous gravel in Placer county, Cal.:

Having had occasion in August last to visit the celebrated mining region, which centres in Forest Hill, I went with expectation of finding confirmation of the usual theory concerning the formation of this gravel deposit.

It is hardly necessary to say that the gravel beds of the central counties of California are supposed to present sufficient evidence of the existence of a system of large but extinct rivers, and that the course of these ancient rivers is believed to have been oblique, and often at right angles to that of the present streams, and to their tributaries flowing through the various cañons which have their sources on the western slopes of the Sierra Nevada range.

Although it is possible that such a mode of explanation may account for even so widely spread a deposit of gold-bearing gravel as exists in Placer and adjoining counties, I think there are certain features in this deposit difficult to reconcile with the theory of the ancient river system, and that a close study of the subject reveals a problem of a very complicated though interesting nature. The first thing which arrests the attention, after looking at the large excavations, which hydraulic power has worn in the gravel banks, in some places leaving precipices from one to two hundred feet deep, is the profusion of boulders of pure quartz which cover the worked out portions of the ground. These boulders lie on the bed-rock in some places many feet in depth.

At Forest Hill and Michigan Bluffs the eye is dazzled in the sunlight reflected from heaps of round quartz, some masses of which will measure several cubic yards.

The smaller boulders are in general washed away, but I looked with surprise at one portion of an unworked bank at Michigan Bluffs, observing that it was composed almost entirely of quartz fragments from pebble size upwards, all having the usual rounded or ovoid form.

There will be little doubt I think that we have here the origin of the gold, which occurs so plentifully in connection with the gravel of this section of country, but the question remains as to how the attrition has been performed which liberates it.

What tremendous powers have, in the first place, dislocated from their original casings the gold-bearing quartz ledges, and in the next, ground to so perfect a smoothness and rotundity the hardest specimens of white, blue and rose-colored quartz fragments?

Mere fluvial action, however violent, will not at all account for the first condition even if it does for the second. Granite, in the Placer county gravel beds, occurs only in boulders associated with the quartz and that sparingly, the bed-rock being universally a slate; and in this respect the difference between the placer diggings of Idaho Territory and those of central California is very remarkable. In Idaho the bed-rock is everywhere granite, and the ledges which have supplied the gold are often distinctly traceable, good diggings being found below them, as in Granite Gulch near Placerville, and none at all above.

To what then shall we refer the disruption in California of that primitive relationship of rocks which we find still remaining in Idaho?

Perhaps volcanic action may account for it, and in connection with this view I wish to present to the notice of the society a specimen of the peculiar substance called cement. This substance occurs very abundantly in distinct, and sometimes alternate, stratification with the gravel in most of the Placer County mines; in fact, in all of them which I had an opportunity of visiting. It does not, so far as I could see, mix with the gravel, but is often of such a depth and hardness as to seriously embarrass the operations of the miner. Being entirely barren it has sometimes to be blasted with powder or nitro-glycerine before the hydraulic stream will act upon it, and then adds greatly to the cost of hydraulic operations.

As will be observed it is a grayish white, and so homogeneous, apparently, in its nature, that the miners generally, though very ignorantly, call it pipeclay. Although this whitish color is the usual tint, I have observed it in some situations to be of various shades of brown.

Now, is this substance a volcanic ash, and if not, what is it?

I think the answer to this question carries with it a solution of much of the difficulty in accounting for the condition of things in central California. Admitting that this cement is a true product of volcanic eruption, the large extent of surface covered by it, and its frequent great depth would lead us to infer an enormous amount of volcanic activity, perhaps in connection with the elevation of the neighboring peaks of the Sierra Nevada range.

Mr. Hanks kindly afforded me a microscopic examination of the present specimen, and it appears to resolve itself into the three elements of granite,—quartz, mica, and feldspar. This is not an unusual condition of volcanic ash, and if my impression is correct, it is, with the addition of sulphur, exactly the analysis of the ash ejected in the recent eruption of Vesuvius.

But even considering it as settled that cement is a volcanic ash solidified by time and pressure, we have still two things to account for, one, the almost total disappearance of the granite, the other the levigation of the quartz.

After due consideration of the effects of pro-

longed action of the snrf on both salt and fresh water beaches, in the production of such gravel and boulders as we see in Placer county, I doubt whether the ancient river system can be taken into the question, or is so clearly unaceable. There is one other mode of explanation of most, if not all, the phenomena alluded to, which I think deserves attention. I refer to the grinding and comminuting power of glacial action.

Of all the forces of nature which effect transformation of the surface of the earth the progress of glaciers is among the most potent. Every year brings new proofs of the extent and importance of the changes effected by glacier movement, and perhaps investigation may show that there was a time in which, from the western slopes of the Sierra Nevada range proceeded icy masses, of a magnitude and weight sufficient to have crushed out and destroyed the original relationships of rock over which they travelled, and to have had much to do with, if they were not the principal cause of the disrupted and almost chaotic state of things in Placer county.

Resources of Utah.—Continued.

Some of the Principal Mines.

We continue these articles from the Salt Lake Tribune: The Wellington mine also in Little Cottonwood Cañon, is located one mile and a half southeast of Alta City, near the summit of the divide between Little Cottonwood and American Fork Cañons. The developments consist of an incline shaft two hundred feet in depth at an angle of about thirty-six degrees; also levels diverging from it approximating to eight hundred feet in length. A body of ore lately discovered is estimated to contain over 600 tons in sight, but of its ultimate extent no calculation has been yet made.

The character of ore is galena and carbonates, and its average assay value is \$90 in silver and fifty per cent. lead. The width of the vein proper is about thirty feet, having ore strata four feet thick following both foot and hanging walls, leaving twenty-two feet of crevice matter laying between those strata. The strata are composed of white spar interspersed with pockets and chambers of ore. The work of prospecting for the main body of ore has been remunerative, and paid all expenses up to the present time. About the first proximo a working tunnel will be commenced which is intended to strike the vein at a depth of 250 feet.

The object of the tunnel is to facilitate the working of the mine, and will be used for taking ore from the mine, instead of hoisting, and also for drainage purposes. The present ore body was discovered about one hundred feet from the surface. A lower level is being now run with a view of ascertaining the probable extent and value of the body. Connected with the mine is the Wellington furnace, which has a capacity of smelting twenty tons of ore per day. The property is owned by the Wellington Mining Company of San Francisco. Incorporated in January, 1872. W. N. Young is general Manager, and E. J. Field Superintendent.

The Davenport and Matilda Consolidation.

Situated in Little Cottonwood Cañon, is owned by John H. Ely and others. Work was commenced in the spring of 1871. This property has only recently come into the possession of the present owners, who paid a large sum of money for it, having full faith in its intrinsic value. The following work has been done towards development: On the Davenport a shaft and incline 280 feet in length, a tunnel 529 feet, two smaller shafts 65 feet, and 50 feet of drifts. Matilda shaft of the Davenport 110 feet, drifts 255 feet; making a total of 1,289 feet. The width of the vein of the Davenport is four and one-half feet, and that of the Matilda from four to twenty-three feet. The character of ore is free milling, composed of carbonates and chlorides, with an abundance of silver and a very small quantity of lead. Its average value is close upon \$150 per ton.

The capacity of the mine is from fifty to seventy-five tons per day.

The out-buildings, hoisting apparatus and appliances are very complete and substantial. A tramway 750 feet long connects the mines with the Grizzly Flat.

The Superintendent is Wm. B. Smith, Esq.

The Lexington Mine.

In Little Cottonwood Mining District, from which Lexington Hill takes its name, is one of the most promising veins in the District. It presents a vein of ore ten feet thick at a depth of ninety-five feet, assays from which show sixty ounces of silver and eight per cent. of lead. The ore is principally yellow carbonates. The mine has two shafts, one ninety-five feet and the other forty-five feet in depth. The claim contains in all 2,000 feet, and presents all the evidences of a true fissure vein. The ore is of a milling character. There are about 250 tons of ore on the dump. The property is owned by General P. E. Connor, Thomas Moore, George Pierson and others.

The El Dorado Mine

In Big Cottonwood Mining District, is located about one mile east of Fish Lake, on a line northeasterly from Emma Hill, and between it and the Uintah District. The mine is de-

veloped by a tunnel 175 feet in length, discovering a vein of ore twenty feet wide, composed of oxides and carbonates, and will yield twenty dollars to the ton of ore by milling process.

The Flagstaff Mine.

Situated in Uintah District, Parley's Park, is owned by the Park Silver Mining Company of San Francisco, organized in December, 1872; Capital stock \$500,000. The officers of the company are as follows: A. H. Morrison, President; F. A. Nims, Secretary; W. R. Morrison, Treasurer; W. H. Howland, Superintendent.

The mine was discovered by W. H. Howland on the 28th of May, 1871, and opened in the fall of the same year. A large amount of ore was taken from it, shipped to Salt Lake City, and sold to good advantage. The present assays show from \$75 to \$150 per ton of silver, and about sixty per cent. of lead.

In the early part of 1872 Dr. Vollum purchased of S. W. Howland and others an undivided four-fifth interest of the mine. Mr. Howland retained one-fifth interest. In the following December Dr. Vollum sold his interest to the present company, which is composed principally of residents of Michigan. From present indications this mine would appear to be one among the wealthiest in the Territory, it lies in close proximity to the following mines, which are all of them in good repute: The Ontario, McHenry, Pioneer, Walker and Webster. The location of the mine possesses many advantages; such, for instance, as an abundance of wood and water, the severity of winter will not interfere with or prevent its being successfully worked, and it is also in the immediate vicinity of a splendid agricultural district.

The Pioneer Mine.

In Uintah District, Parley's Park was discovered in October, 1871. The mine crosses the divide or ridge, which separates Parley's Park from Provo Valley, and is called Pioneer ridge after the mine. It lies at an altitude of over eight thousand feet above the level of the sea. The course of the lode crosses the backbone of the ridge at nearly a right angle. The location comprises fourteen hundred feet. A tunnel may be run entirely through the hill on the mine all the way; and both ends would still be above the bottom of the ravine. A line drawn from one entrance over the apex of the ridge down to the entrance of the tunnel on the other side would, with the tunnel for a base, form a perfect triangle. The lode on the summit is seven feet wide, and the ore ranges from sixty-seven to two hundred and twelve dollars per ton. The work so far consists of an open cut forty feet long and a shaft seventy feet deep. The property is owned by T. S. Moore and George Pierson.

The Last Chance Mine.

Situated in Bingham Canon, belongs to an English company and was incorporated in London with a capital of one hundred thousand pounds sterling.

The mine was only partially opened when the company took possession. Work was immediately afterwards commenced and developments continued. The mine is now well opened and shows a body of ore estimated at seven thousand tons. The ore in the upper level is free milling ore, giving assays of from sixty-five to one hundred and fifty ounces in silver and one ounce of gold to the ton. As the shaft was sunk, the nature of the ore changed to smelting ore, giving assays of from sixty-five to one hundred ounces in silver, and from thirty to sixty per cent. of lead, with some traces of gold. Six hundred tons of ore have been raised and are now on the dump. A furnace site has lately been purchased, and works will soon be erected for the treatment of all ore coming from the mine. The capacity of the mine is twenty-five tons daily. Superintendent, N. M. Maxwell, Esq.; Assistant, J. B. Stanford, Esq.

The Live Yankee Lode

Is situated in American Fork Cañon. This lode has been worked by a shaft 84 feet deep and a tunnel 55 feet in length. The development discloses a vein over 40 feet wide of vein matter, a large proportion of which is galena yielding \$90 in silver per ton and 58 per cent. of lead, with one ounce of gold. There is now a very large quantity of ore on the dump.

The Mary Ellen Lode

Is at the north end of the Live Yankee lode, the developments having been mostly done on the latter near the junction of the two lodes.

LETTER-BOXES IN STREET CARS.—A Chicagoan makes what appears to be a sensible and practical suggestion, in advising that a Government letter-box be placed on each street car in the city, in which letters may be deposited at any point along the line, the same being collected by a Postman at the end of the route, and dispatched to the Post Office. With the box so arranged as to receive the letters from the outside of the car, they may be deposited without stopping it for this purpose. The constant stoppages required in taking in and letting out passengers would afford sufficient opportunity for depositing letters.

By this method, letters could be sent to the Post Office from nearly all parts of the city much more frequently than now. It is not intended to supersede the present mode of collecting by the Postman, but only to add so much to the general convenience. By this arrangement, letters intended for city delivery would often reach their destination some hours earlier than by that at present in use. The plan strikes us as being entirely feasible, and there is little doubt that it would be found a great public convenience.

A Mining Marvel.

Our country is fast becoming famous for novelties in mining development, but the seam diggings of Greenwood and Georgetown; the rotten quartz of the Sliger croppings; the golden plates and threads of the Cederberg, and the auriferous porphyry of our own more immediate neighborhood are eclipsed as novelties by the inexplicable development in the Stuckshlager (better known as the Sam Sims) claim, near Uniontown. It has been and is yielding after the manner of "the good old days of '49." In one spot forty ounces was obtained from a single pan of the deposit, gathered up without selection from its native bed. A panful from another spot yielded five and a half pounds (1) of gold. Another panful scraped from the slanting bed-rock last Tuesday yielded over one hundred dollars, and it is a proverb in that vicinity that "Stuckshlager can take out all the gold he wants." The gold is of extra fine quality, has a rusty—sometimes quite black—appearance, and is found in a seam or small ledge of conglomerate material that has baffled the efforts of the sharpest experts to explain or understand. This pay streak of whatever it is crosses the point of a spur that makes out into Granite Creek from the main ridge. The rich seam varies from one and two inches up to a foot in thickness, running nearly parallel with the creek—and towards the main ridge in a westerly direction, we should think. The components of the pay streak are rotten quartz, ferruginous talc, a black substance resembling plumbago, and other indescribable substances, all of which, however, are equally and thickly charged with gold, bright, rusty or black, from the fineness of flour to the scraggy piece worth a dollar or more. On the clay incline which serves for foot-wall to this novel pay streak, and which has a slope of twenty-two to thirty degrees, we inspected a stripped surface of eighteen by forty feet last Tuesday, and there was hardly a space of six inches square upon which a liberal showing of gold was not visible, and in places there was almost as much of the precious metal as of baser substances. Here it was in quartz that clung like a coating of plaster to the bed-rock; in another place it flecked the soft plumbago-like stuff that we would dig out of the soft bed-rock. Everywhere and in all sorts of substances there was gold, gold, gold! The discovery of this deposit, like many other of the best mining discoveries in California, was partly accidental and quite interesting. Stuckshlager and others had worked in the bed and banks of Granite Creek, generally making good pay, until they reached a small ravine that makes down from the upper side of the spur above described. Above that in the creek there was little if any gold. But little by little the persevering Stuckshlager crept up the steep point, finding a patch of pay dirt here and another there, until the brow of the spur was reached and the wealth-bearing seam, the source of all his previous small findings, was struck. Now his process is to pick down and wash off in a sort of ground sluice the overhanging slate, thus laying bare the shallow but rich pay streak, sluicing down both sides of the point and obtaining rich pay in both directions. Discoveries that are believed to be extensions of this deposit, having every appearance of being rich, have been made in the main ridge to the north and across the ravine to the south, in both cases several hundred feet—that to the north being from a quarter to a half mile—from the present scene of Stuckshlager's operations. Those who are curious in such matters can, by calling at this office, have an opportunity to examine some of the specimens which we picked up at a recent visit, and which will give an idea of the peculiar substances in which these rich gold deposits are being found.—Placerville Democrat.

WOODEN RAILROADS.—Several of these, in operation near Quebec, have an aggregate length of one hundred miles. They have a gauge of four feet eight and one-half inches; the running time is sixteen miles an hour, but trains have run at double that speed. The rails are made of maple strips, four by seven inches in cross dimensions. They are set up edgewise, are notched into the cross ties four inches deep, and are held by two wedges driven into the notch, on the outside of the rail. The ties, eight inches thick, are laid twenty inches apart. The roads cost from \$4,000 to \$7,000 a mile, and the rails will last from two to four years, according to the quality of the timber and the amount of the traffic.

SUTTER CANAL AND MINING COMPANY.—Various claims against the estate of the Sutter Canal and Mining Company, in bankruptcy, as well as other matters, having been investigated by Register Clarke, the testimony has been finally submitted to Judge Hoffman, of the United States District Court, and a distribution of the proceeds of the property ordered. There are twelve claims on mortgages and liens and the order in which they are to be paid is set forth in the decision. The matter has now been referred to Register Clarke for liquidation.

IRON ORE IN 1872.—From the Lake Superior mines, the shipments of iron ore for the season of 1872 exceeded the shipments for 1871 by 138,176 tons, and the product of pig iron, without allowing for any made by the Grace furnace, which went into the blast, near the end of the year, is 11,970 tons in excess of 1871.

MECHANICAL PROGRESS.

New Use for the Steam Jet.

Mr. C. W. Siemens, F. R. S., who ranks among the foremost English electricians and mechanical engineers, has lately shown that the steam-jet hitherto used only to quicken the fire in a steam engine, is capable of improvement, and applicable to many useful purposes. The efficiency of the jet depends upon peculiarities in the construction of a tube which cannot be popularly described in a few words; suffice it, that the steam rushes forth as a ring enveloping a core of air, and this, with steam of only three atmospheres effective pressure, will exhaust air as thoroughly as an air-pump. The jet occupies but little space, and is moderate in cost, and therefore can be used in many places where an air-pump would be too bulky or too expensive. The Pneumatic Dispatch Tube, by which dispatches are sent underground from the city to Charing Cross, is, in the whole of its circuit, nearly four miles long. The engine and air-pump by which the tube was worked cost three thousand pounds; three of the steam-jets now do the same work, and maintain so good a vacuum that the "carriers" in which the dispatches are inclosed travel at the rate of nearly fifteen miles an hour.

By adapting the jet to a double chamber and exhausting the air, Mr. Siemens shows that water can be raised as readily as by pumping. The chambers are so constructed that as one empties the other fills, and so the flow of water is continuous. The contrivances made use of for economizing power and multiplying effect are singularly ingenious; and to prevent the noise that would be occasioned by the combined jet of steam and air rushing from the open top of the delivery funnel of the exhauster a "sound-killer" is placed on the top. This sound-killer is a cylindrical metal vessel, containing a series of perforated wooden diaphragms, and has the effect of deadening noise.

In any case where exhaustion is required, the jet may be employed with advantage, and already the manufacturers of sugar see that it will render them profitable service in evaporating cane-juice from the vacuum-pans. There can be no doubt that it will be largely made use of in the West Indies, where its simplicity will recommend it to a population unaccustomed to complicated machinery. It will also be used for separating the molasses from the sugar; and thus supersede the present expensive and troublesome process.

Another application of the jet is in the production of gas for heating purposes; the blast is admitted under the fire-place, and with such economy, that coal-dust of the most inferior quality can be used, while, all other things being equal, the production of gas is doubled, and its quality improved.—*Ex.*

Improvement in British Artillery.

The English are making extensive changes in their artillery material, having decided so to do from the results of various recent experiments. Among the novelties to be introduced into the service are the small Gabling guns of three cwt., with musket proof shields, the guns to be drawn by two horses. This gun is found to be a most effective weapon in defending villages, field intrenchments, for covering the approach to bridges, for defending a breach, and for employment in advanced trenches and fieldworks where economy of space is important. For naval purposes these machine guns are well adapted for use in the tops of vessels of war, for boat operations, service up close rivers, etc.

Experimental proofs of the special value of compressed gun cotton for demolishing stockades, bridges, etc., have also been obtained.

"Picric powder" is not unlikely to be used in the future. It is found to be remarkable for its safety as compared with other explosives.

Improved wads have also been suggested to prevent erosion in the bore of rifled guns. It is also reported that Mr. Scott Russell has in hand a gun on an entirely new principle with which he expects to astonish the world.

NEW PROCESS OF WOOD-ENGRAVING.—A new process of wood-engraving is called the "planotype." The design to be engraved is transferred to a block of lime-tree wood, which is then placed in a machine having somewhat the appearance of a carving-machine, the shape of which varies considerably according to the nature of the work, the graver being kept red hot by a gas-jet. By means of this appliance the design is gradually burnt into the wood. Figures or letters of reference are impressed by means of punches. The whole design having been burnt into the wood, a cast in type metal is taken direct from the block; and without any further preparation the cast may be used for printing from, like an ordinary stereotype plate. It is said that the wood does not suffer in the slightest degree from the heat of the molten metal, and that the finest details are faithfully reproduced. The process is carried out on a large scale, and is found to give most satisfactory results.

Origin and Progress of Hot Blast Furnaces.

From the earliest times, as among the native smiths of Africa to-day, the blast of a bellows has been used in working iron to increase the heat of the combustion by a more plentiful supply of oxygen. The blast furnace is supposed to have been first used in Belgium, and to have been introduced into England in 1558. Next came the use of bituminous coal, urged with a blast of cold air. But it was not until 1829 that Neilson, an Englishman, conceived the idea of heating the air of the blast, and carried it out at the Muirkirk furnaces. In that year he obtained a patent for his process, and found that he could from the same quantity of fuel make three times as much iron. His patent made him very rich; in one single case of infringement he received a check for £150,000. In his method, however, he used an extra fire for heating the air of his blast. In 1837 the idea of heating the air for the blast by the gases generated in the process was first practically introduced by M. Faber Dufour, at Wesseralingen, in the kingdom of Wurtemberg.

In this country, charcoal was at first used universally for smelting, anthracite coal being considered unfit for the purpose. In 1820 an unsuccessful attempt to use it was made at Mauch Chunk. In 1823, Frederick W. Geisenhainer, of Schuylkill, obtained a patent for the use of the hot blast with anthracite, and in 1835 produced the first iron made with this process. In 1841, C. E. Detmold adapted the consumption of gases produced by the smelting to the use of anthracite; and since then it has become quite general, and has caused an almost incalculable saving to the community in the price of iron.

THE INFLUENCE OF THE HOT BLAST.—Professor Akerman, of the Polytechnic Institution of Stockholm, and Professor Tunner, of the Mining school of Leoben, in Austria, have published their views on the influence of the hot blast in the furnace. Akerman contends that the great increase of temperature, and consequent economy of fuel, is chiefly attributable to the circumstance that the heat, which is carried by the blast into the furnace, as compared with that created by the combustion of the fuel, is introduced therein without increasing the volume of gases, as a greater bulk of expanded gases escaping at the furnace top will naturally carry a greater amount of heat with it. Seeing, however, that a hot blast of only 350° to 450° Fahr. will cause an economy of 25 percent. of fuel against a cold blast. Tunner asserts that beside the actual quantity of heat which the blast carries with it, its favorable influence must be looked for in the fact that it facilitates a rapid and complete combustion of the fuel, forming carbonic acid only, which again is not so easily to be reduced into carbonic oxide as Akerman and Bell seem to take for granted. While Akerman is of opinion that for producing white forge pig the temperature of the blast should not be raised over about 500° Fahr., it is claimed that in Styria white and mottled pig iron are constantly produced with hot blast of over 900° Fahr., when the burden is only fluxed with somewhat more lime, the pressure of the blast diminished and the crucible widened to some extent.

THE BESSEMER STATIONARY SHIP SALOON seems to have encountered an unexpected rival in a floating cabin devised by M. Alexandrovski, the inventor of the "under-water" vessel. The construction is very much the same as that of the Bessemer, but the cabin, instead of being attached to a pivot, literally floats in a kind of tank placed amidships between the engines. The invention has been tested by the Grand Duke Constantine in his capacity as head of the naval department, with a perfectly satisfactory result; all efforts to shake the cabin proving utterly unsuccessful, and the pitching, as well as the rolling motion of the vessel being completely counteracted. M. Alexandrovski has gone to England in order to patent his invention, intending to visit France also with the same object. It is expected that he will prove a formidable rival to Bessemer in this direction.

THE PNEUMATIC TUBE TO BE TESTED.—Congress, at its last session, appropriated \$15,000 as a fund for testing the practicability of the pneumatic tube for transmitting small packages. The experimental tube is to be put into operation between the Capitol at Washington and the Government printing office. Mr. Albert Brisbane, the inventor, claims that he can transmit packages from New York to San Francisco by this method. The inside diameter of the tube laid at Washington is thirty-one inches, and that of the sphere, which is to be propelled through it by atmospheric pressure, is thirty inches.

AMERICAN SHIPBUILDING.—The passage in the President's message, relating to the rise of the price of labor in Europe, and the consequent probability of a revival of American shipbuilding, seems to have been well-founded in fact; for the proprietors of a Chester, (Pa.) yard have actually underbitten the shipbuilders of the Clyde in a proposal of the Anglo-American steamship company to construct four iron steamers for them. There is good reason for believing that the offer of the Chester company will be accepted, and, if so, a powerful impetus will be given to the American maritime interest.

SCIENTIFIC PROGRESS.

Contortion of Rocks.

The phenomenon of a layer of limestone, slate, coal or other rock, bent even to a right angle, without utter fracture, is one which a sudden force could not produce, if the mass were solid; and the hypothesis that in such cases the strata were soft and plastic at the time of contortion, does not explain the circumstances, and is for some kinds of rock *a priori* difficult or impossible to admit. When it is once assumed, however, that the forces lifting and binding rocks, were and are mostly very slow and gradual in their action, the difficulty vanishes; for it is now demonstrable that solid and crystalline rocks can be permanently changed in form by such pressure.

Sir James Hall, by an experiment now familiar to geological students, showed upon a pile of cloth, representing a series of sedimentary rocks, the effect of horizontal, lateral pressure in causing curves and folds; but Mr. L. C. Miall, Orator to the Leeds Philosophical Society, has recently applied a similar apparatus to the actual flexure of thin layers of stone, and has found that they can, not only be bent within the limits of elasticity, but permanently "set" without fracture.

It is mentioned as a curious fact that a certain kind of stone found in Missouri, when subjected to heavy pressure, shows quite a degree of elasticity, so that it will contract or expand as the pressure is applied or removed. The statement does not tell us whether this experiment was tried with the stone set up on its edge, or whether it was placed with its plane horizontally as it came from the quarry. But the same fact has been noticed before, indeed, for ought we know forever. Certain qualities of stone, the sandstone, slate and soapstone, in which the body particles are atomized, are peculiarly sensitive to contraction and expansion, from pressure and other agencies, but, not to anything like the extent in a vertical as in a horizontal direction, when they are subjected to test in the same relative position which they occupied in their natural bed. Even granite and trap, and conglomerates generally, are to some extent of the same nature. This should be borne in mind, and when stone is used for construction, especially when put into important buildings or strong abutments, it should be laid just as it lay in the earth, and thus obviate the greatest tendency toward fracture or displacement by the inequalities following the contraction of one more than another, or the expansion or contraction of the whole mass.—*Ex.*

DETERMINATION OF MERCURY IN ITS ORES.—A. Eschka, in a recent German scientific paper, which we have before alluded to in the Press, gives the following method for the determination of the amount of mercury in any given ore: The pulverized ore, after weighing, is placed in a porcelain crucible, the edge of which has been ground. It is there mixed with about half its weight of pure iron filings, and the whole covered with a layer of the latter 0.5 to 1 cm. high. The crucible is then covered with a weighed concave lid of gold having an even edge, and the depression in the cover is filled with distilled water. The crucible is then heated for ten minutes in a flame which surrounds the lower portion of the crucible. At the end of this period which suffices to volatilize all the mercury, the gold lid which has amalgamated with the mercury is taken off, the water poured out, and the mirror of mercury on the convex side washed out with alcohol, dried on a water bath, and after cooling weighed. The increase in the weight of the gold cover corresponds to the amount of mercury in the ore. The author then proceeds to give details as to the precaution to be taken in the manipulation of this process.

ASTRONOMICAL PRIZE AWARD.—At the late meeting of the French Academy of Science, the Astronomical prize was awarded to Mr. Huggins, in consideration of some very important discoveries made by him through the aid of the spectroscopic, with regard to the composition of planets, stars, nebulae and comets. He has clearly shown that the constituents of all the celestial bodies are the same or similar to those of the earth. He has also shown that while the light emitted by the nucleus of comets is inherent in itself, that exhibited by the nebulous surrounding atmosphere and "tail" is merely reflected sunlight. A uniformity in chemical composition is thereby shown to exist throughout all the bodies of space.

SCIENTIFIC PRIZE AWARDS.—The French Academy of Sciences has awarded its prize in botany for 1872, to Professor Notaris, director of the Botanical Gardens of Genoa, for his remarkable studies on mosses. M. Duqueane, a French druggist, was also rewarded for his useful researches on the active principle of aconite. In zoology, M. Schotte, a professor at the University of Copenhagen, received a prize for his studies on the metamorphoses of coleoptera, etc., etc.

How far Can We See.

Herschell was of the opinion that, with the telescope he used in those researches in the heavens which immortalized his name in the annals of Science, he could penetrate 497 times farther than Sirius, assumed to be at least so far distant that the sun is near at hand in comparison. While exploring with that instrument, 116,000 stars dotted by the object glass in one quarter of an hour, and that subtended an angle of only 15°. So all the worlds are moving rapidly in space. Reckoning from the limited zone thus inspected, the whole celestial region could be examined by giving time enough to the enterprise; and judging from a few sections within the scope of assisted vision, more than five billions of fixed stars might be reasonably supposed to be recognizable, and could be seen with modern improved instruments. But more are beyond, vastly beyond, and we are hoping and expecting that, when Mr. Clark, the self-made astronomer of Cambridge, Mass., and the most progressive telescope manufacturer now known to scientists, has completed his great work, far more amazing discoveries will be made in the firmament. Surely, the mechanism of the heavens demonstrates the existence of an Intelligent First Cause, since such magnificent displays of unnumbered worlds, regulated by laws which secure order in the universe, could not have originated themselves. God surely reigns and directs.—*Scientific American.*

THE ANCIENT "ATLANTIS"—WHAT IT INCLUDES.—It is well known to readers of history that no less a person than Plato sent down to posterity a tradition of his day, that a great continent which occupied the place or area now covered by the Atlantic ocean, suddenly sank out of sight, into the unknown depths. He further says that it was an island called Atlantis; on it were kingdoms and organized governments, wealth, arts and civilization—all instantly lost to sight. It is now the opinion of some of the most learned geologists, who have given attention to this special subject, that the American continent appeared when the Atlantic waters rushed into the enormous cavity or depression on the earth's surface now filled by salt water. The Rocky Mountains, according to this theory, were then the rough bottom of an ocean, which rose with marine plants, shells, and other objects of an aquatic origin, that are abundantly strewn there, and in fact all over North and South America. Remnants of Atlantis, the submerged continent, are believed by some scientists, who have made the matter one of particular geological investigation, to be recognized in the Adirondacks, also in the mountain ranges in some parts of Maine.

THE OXY-HYDROGEN LIGHT.—Exhaustive experiments have recently been made in Paris to test the utility of the oxy-hydrogen light, and Mr. M. P. Thomas, acting under instructions from the Paris Society of Civil Engineers, has recently presented to that body a report upon the light. The conclusions arrived at are the following: (1) Theoretically, the combustion of oxygen does not increase the illuminating power of a given volume of gas. (2) Practically, however, it enables a burner to consume four times the quantity of gas that can be burned in air, without detriment to the utilization of the light which may be developed. In particular, it utilizes the entire luminous capacity of the gases, however rich, and in almost any quantity. Consequently, it would be disadvantageous to employ it for ordinary street-lighting, on account of the limited quantity of gas consumed by the burners, the only advantage being the beauty of the light provided the gas is very rich. But it is very disadvantageous for great centres of light (sunburners, etc.), where a large volume of gas is to be consumed without loss.

SCIENTIFIC EXPERIMENTS WITH IRON.—M. Caron has succeeded in putting iron into the condition called "burnt," by heating it in the open fire, in nitrogen gas, and in hydrogen gas; whence he concludes that this condition is not due to the absorption of any special gas, but to a modification in its molecular condition, caused by the heat. Caron also tested samples of iron at temperatures from 0 deg. to 18 deg., and concludes that iron does not become brittle by cold. He says, "Whenever, by a strain, a bar of iron breaks with a crystalline fracture, it is certain that this structure pre-existed; it may have originated in poor workmanship, but is not due either to the long use, nor to the cold which it has undergone."

NEW MIXTURE FOR CRUCIBLES.—A crucible for steel and the noble metals can be made from a mixture of broken porcelain ten parts, graphite ten parts, fine asbestos, three millimeters long, fifteen parts, not too finely pulverized quartz three parts, fire clay twenty-two parts. It is claimed that the asbestos prevents cracking and breaking, and thus provides against loss.

AIR WAS COMPRESSED by Professor Tyndall, by means of a column of water 260 feet high, to one-eighth of its original volume, (120 lbs. to the square inch) and then allowed to escape. As it rushed out, it expanded so violently and caused such an intense cold that the moisture in the room was congealed into a shower of snow, while the pipe from which the air issued became bearded with icicles.

[S. F. Stock and Exchange Board.]

THURSDAY EVENING, Feb. 13, 1873

SURRO TUNNEL.—In shaft No. 4, a diamond drill has been started. Eight holes will be drilled in the shaft 50 feet deep; when the drill is removed the holes will

MINING SUMMARY.

California

out and crushed, and when that fact is considered but few mines show a better quality of ore. The ore is also rich in sulphurets that assay as high as \$225 per ton. The battery is to

that new and extensive hoisting works are to be erected in the spring, the old works being insufficient to cope with the increased body of water.

EL DORADO.

several dollars in silver mixed with a trace of copper. This ledge is said to be as wide as the renowned Big Blue of Kernville. There is said to be enough ore in sight to drive a 20 stamp mill a year. The size of the ledge being so

with green, its owners have in accordance with

these evidences of its character named it the Green Gold Monster.

SALE.—Feb. 1: Mr. J. J. Murphy, our leading merchant, has just purchased of Mr. Hugh McKendancy a one half interest of all the mines belonging to that gentleman. The purchase is an extensive one; conveying some seven or eight mines, prominent among which are the Delphi and Connets of Tyrol. The price paid for these valuable mines is only \$20,000.

NEVADA COUNTY.

FRENCH COBAL.—Cor. Marysville Appeal, Feb. 8: The famous mines near this town are being worked. This quaint old town has taken a new lease of life and is fast resuming the activity and bustling energy of the long ago. Miners are busy, water is being brought in, claims are being opened and some are worked, giving employment at good wages to all who seek a living by labor.

PROVINCIA.—Nevada Transcript, Feb. 11: This mine on Deer Creek, which has been for some time past worked by enterprising gentlemen who took hold of it under most discouraging circumstances, is looking and paying first rate. The ledge is 8 ft. thick, and the rock is richly studded with sulphurets. The returns are most encouraging, and the mine as a paying institution will soon take rank among the first mines of the county.

Feb. 12: The vast body of "hill diggings" near this place were worked in 1854 by G. W. Gloister. The ravine leading to the channel, and down which the tailings from the claims are poured, was worked in 1850 and paid immensely. About \$3,000,000 was taken from this little stream, and in following it to the hill the "pitch" of the bed rock gave evidence of the channel beyond. About the time others opened claims on the north side of the present town. The gold in the claims, as well as that found in the ravine, was fine, the largest pieces rarely being worth more than fifty cents. The Milton Mining & Ditch Co's ditch has been enlarged to a carrying capacity of 5,000 inches. This Company has made arrangements by which they will be supplied with water the year round until their new ditch shall have been completed; when completed, it will furnish 10,000 additional inches. The first tunnel was operated in 1860, the cost of its construction being \$10,000.

PLACER COUNTY.

THE SALSIO.—Placer Herald, Feb. 8: This mine, which paid so flatteringly for the first 100 ft., is again at 150 ft. deep showing a fine, rich ledge. From about 110 to 140 ft. the ledge seemed broken and badly defined, but when the shaft reached near 150 ft. it came into the shaft, the same old golden, familiar, fat rock, finely defined, and promising to hold out for any depth.

The new rich strike, spoken of last week, was made near Temperance Flat, 3 miles northwest of here, in the Lone Star District. The ledge is 2 ft. thick, and many extensions have been taken up.

GREAT BLUE GRAVEL.—The Superintendent of this mine, has sent us a box of specimens of the washed rock, gravel and cement from this mine, located near Todd's Valley, taken from a point 230 ft. below the hoisting works and 350 ft. deep from the surface, and evidently from near the bottom of the channel. These specimens carry mineral and show beyond cavil that they came from an old river channel.

RISING SUN.—Placer Argus, Feb. 8: We were on Tuesday last, shown some rock taken from the mine at Colfax, which was literally interspersed with gold. It has been worked continuously for about 6 years, the main shaft is down 400 ft. and they have drifted about 400 ft. on the ledge. All of the rock taken from the ledge has been worked and yielded on an average \$28 per ton. The specimens shown us were taken out between the 300 and 400 ft. levels and some of them were found over 200 ft. apart. The company have a 5-stamp mill in operation. They cleaned up for the month of January over \$1,800.

SAN DIEGO COUNTY.

BANNER DISTRICT.—Cor. San Diego Union, Jan. 30: George V. King has sold his one-fourth interest in the Golden Chariot to his partners, for the sum of \$25,000. The main shaft is now 90 feet deep, showing a better prospect than ever before. Levels will be started at the depth of 125 ft. The ledge in the 50-ft. level is about 3 ft. wide and very rich. The new whim works like a clock and sinking is much easier than was expected. In fact, the prospects of the Company were never as good as at present, with a fine large ledge in sight, and about 400 tons of rich rock on the dumps.

SONOMA COUNTY.

MINING EXCITEMENT.—Cloverdale Bee, Feb. 8: There is some excitement here at present relative to quartz, and men from town have been prospecting in the neighboring hills and ravines the past week or two. Some persons report that they have found good prospects, both of gold and silver. Specimens of the rock have been sent to San Francisco for assay.

TUOLUMNE COUNTY.

SPRING GULCH.—Sonoma Democrat, Feb. 8: The ore crushed at this mine, during the month of January, yielded \$2,300 over and above expenses for the month. The ore worked, came out where the vein is 22 ft. in width and 140 ft. below the surface.

MASTON.—Sonoma Independent, Feb. 8: We were shown this week by the Smith Brothers, a \$500 chunk of gold from the crucible; the product of about 30 tons of rock. At least 15 tons of the rock crushed was far below the average grade. Their shaft is 90 ft. and shows a vein 20 ft. wide.

SAN BERNARDINO COUNTY.

HYDRAULIC MINING AT LITTLE CREEK.—San Bernardino Guardian, Feb. 1:—The Lytle Creek panners, first organized in 1862, after being worked by a company for several years, have passed under control of the Messrs. Abadie, who have been very successfully developing them for several years. More than 3 miles of ditch, with convenient bulkheads, flumes, and other appliances, have been constructed. The gravel-gold-bearing alluvium—is subjected to so powerful a force by means of water that banks melt and hills crumble in a manner truly wonderful. As the deposit is almost inexhaustible, these works are likely to constitute for years to come, a prominent feature of mining industry in this part of the State. The gold saved is mostly coarse, in many instances the pieces ranging from \$15 and \$20 to \$40 and \$50 in value, together with a large yield of scale gold. The Abadie claim is some 12 miles from town, and lies near the mouth of the cañon.

LIZZIE BELLOCK.—San Bernardino Argus, Feb. 6: Probably a majority of the people of the State are unaware of the vastness and richness of the mines in our immediate vicinity. Some statistics are here presented: The Lizzie Bellock shipped from Sept. 7 to Nov. 1, 310 sacks of ore, weighing 29,703 lbs., and netting \$14,460.46.

McFARLAN.—Shipped during 1872, 1,116 sacks of ore, weighing 89,219 pounds, and netting \$29,267.66.

HOLCOMBE VALLEY.—This very important mine, distant 40 miles, was recently sold to an English Co. for \$120,000. The new company propose to run a tunnel a distance of 2½ miles after striking the bed rock. The present owners have sent their own assayer from London, who says that they propose to expend \$150,000 in prospecting during the present year.

Nevada.

REESE RIVER.

RICH STRIKE OF COPPER ORE.—Reese River Recorder, Feb. 7: We have been shown a number of specimens of copper ore which are richer in that metal than any we have ever seen; it assays 75 per cent. in copper. These specimens were taken from the "Columbus" mine situated in Bolivar District, 75 miles west of Austin and 35 miles from Oresma Station, on the Central Pacific Railroad; the ledge is reported to be 4 ft. thick and the stratum where these specimens were taken from is 12 inches in thickness, of solid metal.

WASHOE.

LEO.—Gold Hill News, Feb. 8: This is one of the old Gold Canon locations. In 1860 a tunnel was run into the hill a distance of 280 ft. following the ledge, which is about 25 ft. wide, and good pay ore was developed. In the general decline of mining interests the work was suspended. The tunnel is cleaned out and at a favorable point 16 ft. in from the mouth, an incline is being sunk in the ledge which is now down 40 ft. The pay ore, mostly of the gold character, lies in two strata, one on each side of the ledge.

HALE & NORCROSS.—Daily yield, 180 tons of ore, worth \$36 per ton, showing an increase in the daily yield of 30 tons of ore per day. The ore breaks between the 8th and 9th and 10th stations are opening out finely, slaking in the ledge which is now down 40 ft. The pay ore, mostly of the gold character, lies in two strata, one on each side of the ledge.

VIRGINIA CONS.—The shaft is down 661 ft. The sinking is making excellent progress. The main north drift on the 1,167-ft. level of the Gould & Curry shaft is still pushed with all the vigor possible in a direct line, to connect with the shaft, without regard to ledge developments for the present.

LEO.—The main east drift on the 1,500-ft. level has made slow progress during the week, on account of the steady flow of water and the extreme heaviness of the ground. The main south drift on the 1,600-ft. level, to connect with the north drift from the Savage, is making good progress.

KNOX BROOKER.—During the week the main west drift at the 400-ft. level, based through 12 ft. of a clay wall and struck quartz of a good character, but a strong flow of water was also tapped, so that the workmen were obliged to secure the drift as well as possible and go to hoisting water.

CALIFORNIA.—The main north drift at the 400-ft. level of the new shaft has made the connection with the north winze from the level above, giving a good circulation of air and greatly facilitating the work in that part of the mine.

WOODVILLE.—The ledge opens out finely at the lowest level, 320 ft. from the surface. It is being drifted upon from that point, both north and south. The north drift shows a very fine body of rich ore, which widens out as further developed. The south drift also shows splendidly the ledge holding its width. Both drifts are yielding large quantities of high grade ore.

SIERRA NEVADA.—Daily yield 65 tons of ore, keeping the mill steadily running.

ARIZONA AND UTAH.—The water has been drained from the shaft and sinking resumed.

BELCHER.—Daily yield, 370 tons. The mine never looked so well as now at all points, and the lowest, or 1,200-ft. is opening out much better than was expected. The ore is being breasted out at that point 6 sets of timbers in width, and assays run high throughout. The face of the south drift is in porphyry, and quartz with a streak of ore.

CROWN POINT.—Daily yield about 500 tons, a large portion of which is from the 1,300-ft. level. The ore body is opening out at this point better even than was expected by the most sanguine, the ore being of extra fine character.

YELLOW JACKET.—The 1,600-ft. level main drift east is being driven ahead and has, it is estimated, about 50 ft. to go in order to reach the ledge.

SILVER CLOUD.—he slopes and face of the upper and lower drifts are looking and yielding splendidly; 20 tons daily of high grade ore, is being shipped to mills, and the Superintendent estimates that there is fully 200 tons of ore in sight, which can be extracted at very small cost and excellent profit.

BONNY.—This mine is situated in Spring Valley, Devil's Gate District. A shaft has been sunk to the depth of 10 ft. on the ledge, which at that depth shows a fine vein of good ore 2½ ft. in width. A quantity of ore taken from Quinn, an adjoining claim on the same ledge, yielded \$74 per ton.

BALTIMORE CO.—Shaft down 443 ft. with the bottom in very hard blasting rock at present. The drift west at the 250-ft. level is in 301 ft. with the face in porphyry and quartz, some of which gives low assays.

CHOLLAR POTORI.—Daily yield 80 tons, the assay value of which is \$33 per ton, showing a decrease in the daily yield of 40 tons of ore from the week. The prospecting drifts on both the 750 and 950-ft. levels are pushed with all the vigor possible.

ALAMO.—The labor of hoisting by hand from the shaft being too great for the men to endure, preparation is being made to erect machinery with which to do the hoisting.

STUCKER.—The main drift from the shaft in the canon has cut a vein of ore 2½ ft. in width, and the course of the drift was then changed so as to follow and prospect the vein.

JUSTICE.—Work is resumed in this mine, under the most favorable auspices.

GLOBE.—The drift to connect with the shaft is in 43 ft. The raise from the main tunnel is up 60 ft., the face showing some excellent indications of good ore.

OVERMAN.—The pump continues to handle the flow of water with ease, and is gradually draining the supply. The main west drift is still driven ahead.

KENTUCK.—The only operations at present are in the old workings about the 400 and 500-ft. levels, which continue to yield considerable good ore yet.

SAND DESERT.—The main east drift is 3,357 ft. Face in good working ground with no water.

JULIA.—The main east drift at the 800-ft. level is making good progress, with very little water in the face.

ELY DISTRICT.

RAYMOND & ELY.—Pioche Record, Feb. 2: Between 80 and 90 tons of first-class ore are raised daily, and about 30 tons of third-class—the medium or second-class grade being assorted into first and third-classes before shipment to the mill. About 150 tons are being sent to the mills daily, the Co's 2 mills being constantly engaged in reducing, and the Magnet mill a portion of the time. The production of bullion is enormous.

NEWARK.—The ledge cut in the south drift the past week, on its 500-ft. level, is now being worked, and looks favorable. The vein varies from 2 to 8 inches in extent, and the ore assays over \$200, being high grade. Work has been suspended in the main shaft to timber up, but will soon again be resumed. The shaft is now over 600 ft. deep, being next to the deepest in Southwest Nevada.

LOUISE.—There is now considerable rich chloride ore on the dump, which was extracted from a depth of 200 ft.

HURN & HURN.—A large amount of ore has been delivered at the new Florist mill during the week, much of it first-class, and there is no intermission in the hauling, about 28 tons a day being delivered. All this is from the back ledge. Every drift and way stop is of good size and the ore is very rich.

NEW YORK TUNNEL CO.—This is a location recently made under the new Mining Law. The float and top rock from several ledges found assay from \$50 to \$700 per ton. The tunnel site is a few miles west of Pioche, and work has already been commenced. It is the intention to run the tunnel 500 or 600 ft.

UTAH DRIFT.—The ledge cut in the main shaft of a new lode, which was located some time last week. It is not far from town. After prospecting unavailingly for two months last Monday a body of very rich ore was struck. A sample is lying before us, and is apparently very rich.

PORTLAND.—The winze is now down 85 ft., showing a vein 3½ ft. wide of splendid ore, the average assay being \$102.

PI-CHE PHENIX.—The new shaft is down 270 ft. The rock has been very hard the past week, but is again becoming soft. In the old works drifts are being run for ore connections. Satisfactory results so far.

MAZEPPA.—A winze is being sunk on the main vein of ore. From 20 to 30 tons of ore have been raised during the past week. The ledge is looking finely in all its drifts and stopes, and gives renewed promise of soon producing bullion in large quantities.

ALRE.—The dump is full of good ore, and about 7 tons a day are being shipped to the mill. Milling will soon be begun. The main shaft is now 300 ft. in depth, from which point the ledge will be drifted for this week.

SILVER BEAR.—During the week the incline has been sunk about 15 ft. depth. A certificate of assay of two classes of rock from the bottom of the Silver Peak incline gives as follows: "Grey, per ton, \$169.64; light, \$150.77." The vein is about 6 inches in width. Work is progressing on the tunnel below finely.

STANDARD.—The average assay of the ore on the dump is \$192. Two shifts are engaged.

MARION.—Still sinking on the ledge. Shaft down 250 ft. The ledge is very large, and runs very regularly.

WASHINGTON AND IDAHO.—The ledge has been improving lately, beyond doubt. A new contract has just been let to sink the incline 100 ft. deeper.

PROCHE.—During the month of January 155 tons of ore have been shipped from the mine to the Magnet mill; and from this amount well on to \$15,000 worth of bullion have been returned. The ore breaks as is favorable as ever in extent and quality, and the usual amount of ore continues to be hoisted daily.

CHIEF EAST EX.—Sinking the winze below the 90-ft. level; now down 95 ft. The ledge is from 12 to 15 inches wide, and mixed with some fine ore; improves as drifting east continues.

Arizona.

WALLAPAI DISTRICT.—Prescott Miner, Jan. 25: A citizen of Corbat contributes the following to the Los Angeles Express:

Allow me to premise, after 23 years experience on the Pacific Coast, that I have never found a chain of mountains so richly endowed with mineral wealth, as this district—every day new ledges are struck, and the assays are wonderful.

In a short letter it is impossible to speak of the multitude of rich mines, but I must say that as a big thing, the Ida mine is simply tremendous; it is down 25 or 30 ft., and of more than 30 assays made, the ore averaged over \$1,000 per ton. Our only cry is for more mills to work our rich ore; as it is at present, we have to pay one hundred dollars for the purpose of working the ore in San Francisco.

ITEMS.—Nearly \$1,000 in gold dust was brought here this week by placer miners of Lynx and Hassayampa creeks.

No ore is being worked in Bradshaw mountains, but a great deal of ore is being taken out.

A Mexican gentleman writing to the San Diego World, gives glowing accounts of the silver mines on the line between Sonora, Mexico, and our Territory, ore from which has yielded at the rate of \$1,500 per ton. He says that his government is anxious to forego it to go there and work.

Lower California.

SAN RAFAEL COPPER AND SILVER MINING CO.—San Diego Union, Jan. 28: Among the passengers of the "Pacific" which arrived here on Sunday afternoon was Mr. C. F. Robinson of San Rafael. Mr. Robinson is interested in important mining enterprises in the vicinity of San Rafael, Lower California. His recent visit to San Francisco was for the purpose of organizing a company for the development of his mine, which we learn he was successful in doing. The company has been incorporated as the San Rafael Copper and Silver Mining Company, with a capital stock of \$3,000,000, in 30,000 shares of \$100 each. The Trustees are S. A. Raymond, J. A. Albertson and Thomas Rogers. The object of the Company is mining for copper and silver in the San Rafael Mining District, Lower California; to erect mills and smelting works; to purchase and sell mining and other stock and property.

Mr. Robinson has brought with him from San Francisco all the necessary tools for mining, hoisting machinery, and ample supplies of provisions for those employed in the Co's service. The ledge upon which the operations are going to be commenced is situated 20 miles from San Rafael. It is well defined, and about 6½ ft. in width. The vein matter assays from 40 to 41 per cent. copper, and native party ore—and contains a small percentage of silver besides.

Montana.

LEGAL TENDER.—Helena Herald, Jan. 28: On last Sabbath afternoon, at the depth of 16 ft. they unexpectedly came upon a vein of solid ore 10 inches in width, and the average assay is \$2,800 in silver per ton of 2,000 pounds, of which the poorest of the vein went \$2,100 and fancy samples, \$17,300. The crevice matter is 27 inches wide. This is considered by the most experienced miners to be the greatest strike ever made in the Territory, and excels anything known in any mines on the continent. The ore is galena with sulphate, ruby and native silver.

UNION LODGE.—During the last half of the year 1872, 3,208 tons of rock were crushed giving a gold yield of \$143,975.

GOLD PRODUCT.—Helena Gazette, Jan. 30: An estimate made by J. J. Valentine of W. F. & Co., puts the total bullion product of Montana, at \$1,000,000. The universal testimony of business men, bankers and miners from all parts of the Territory, as figured up by one of our close calculators in a banking house of this city, places the yield at \$8,000,000.

MIN SHOWING.—Messrs. Keating & Blacker are reported to have a larger quantity of gold-bearing quartz mined and worked than they can crush during the year. The ore is of high grade, and will average more to the ton than that of any other year's working.

ITEMS.—Deer Lodge Independent, Feb. 1: There are but two men working in Hope Gulch at present, who are making fair wages. The water they use in sluicing is supplied by springs near by, that never freeze over. At Dog Creek, Butler & Co. are engaged in making the necessary preparations for early spring work. At Meadow Creek, or Little Blackfoot, McGuire & Ward are doing the required preliminary work on their claim, looking to an early start in the spring.

Hohart & Barton are busily engaged in taking out coal from their mine. Having completed their incline down to the water level, they are now hoisting the coal up the incline by pulley power. The mine will produce about 100 tons on the dump. Their mine improves in appearance, and the coal in quality, as they go down.

Oregon.

THE MINES.—Le Grande Sentinel, Feb. 1: Packwood & Stewart are now engaged with their quartz mill on a run of 200 tons of rock, having crushed about one-half of it. Great are the expectations as to the result, and when it is considered that the Summit Ledge, the rock of which constitutes the run above referred to, there is every reason to believe that a heavy clean-up will be made. The Conner Creek ledge (in Baker county) is richly and beautifully. The claim of Matcock & Palmer is thoroughly prospected, and is now yielding \$5 to the bucket-full of rock. In the placer mines the Eagle Creek country miners are now at work with rockers, using heated water, and are realizing from \$5 to \$7 per day.

ELDONADO MINES.—We learn that every indication exists for a heavy yield the present season. The ditch is a work of great magnitude, and will furnish water the entire season. The mines are good, not exceedingly rich in spots—and all that is wanted is water to make them yield the precious metal.

PRESERVED FLOWERS.—We saw this week a beautiful wreath of preserved natural flowers, enclosed in a handsome frame, which looked as natural and fresh as when culled from the parent stem. The wreath is made up of camelias, heliotropes, hlaes, geraniums, verbenas, orange blossoms, etc., all perfectly tautious and showing no liability to fall apart. Camellias, we think, have never before been preserved, but the operation has been performed so successfully in this instance that they will hereafter, no doubt, have a conspicuous place in preserved bouquets and wreaths. We have in California many beautiful wildflowers, which for richness of coloring and delicacy of tint, are unsurpassed, but unfortunately they wither quickly when plucked, so unless one sees them "on their native heath," their brilliancy is much impaired. By the chemical process by which the wreath mentioned was preserved, these flowers could be seen in all their native glory by preparing them immediately on the spot, and we are surprised that attempts have not been made in that direction. The wreath spoken of was made by Mrs. A. O. Cook, in April, 1872, and will shortly be placed on exhibition at Woodward's Gardens, where all such curiosities of merit readily find an appropriate nook.

SUIT AGAINST THE BORAX COMPANY.—Henry N. Wymann has commenced suit against the Pacific Borax Company and Michael Kane, Edmond Luba, Adam Merle, Justinian Caire and Joseph Mosheimer, Trustees of the corporation. The complaint states that the company commenced working in July, 1872, and since then the price of borax has been, in San Francisco, 28 cents per pound, and in New York from 30 to 36 cents per pound, and if the business was carefully managed it would prove lucrative; that the defendants (the Trustees), upon his information and belief, are colluding together to advance their own interests, that the affairs of the company have not been properly or honestly conducted by the Trustees, but that they have produced great profits to themselves, and rendered the stock almost worthless to the stockholders; that on the 15th of September, the Trustees sold to the defendant Merle, 75 tons of borax at \$100 per ton and \$100 freight, when, at the time of sale, the said borax was worth \$500 per ton. The Trustees appointed Mosheimer, Superintendent of the works, at a salary of \$500 per month, a large sum of which, \$1,500, remains unpaid. On the 6th of December, 1872, the Board sold to Merle, 75 tons of borax at \$135 per ton with freight, when it was worth \$500 per ton. That on the 26th of December, 1872, the Board appointed the defendant Caire, agent for five years for the sale of borax, paying him ten per cent. commission.

The complaint also alleges that assessments to the amount of \$36,000 have been levied; of which \$20,000 has been paid in, but if the business of the corporation were diligently managed no assessments would be necessary; that on the 31st of December, 1872, the Board levied an assessment of twenty-five cents per share, which will be delinquent on the 15th of February, 1873. The plaintiff prays for an injunction against the sale of the stock for the non-payment of the assessment; that the defendant (trustees) may be removed from office, and such as may be found guilty of gross negligence be decreed to reimburse the corporation, and that the contracts made by the trustees be declared null and void.

USEFUL INFORMATION.

Mysterious Fires.

The secret destructive fires, and their not-unfrequently mysterious occurrences, has lately attracted much attention to the subject of the origin of conflagrations. It appears that the Fire Marshal of New York has recently been holding steam responsible for some of the mysterious fires in that city. In reference to this surmise a cotemporary asks and answers as follows:

Can Buildings be Set on Fire by Steam-pipes?

As steam may be considered to be the most safe, healthy and economical of all modes of heating buildings, such a suspicion is to be deplored, as it is apt to raise a prejudice against it; but hot-air furnaces may be considered dangerous, as proved by the well-established evidences of the fire records, but not so with the steam heating. In fact, there is not any well-authenticated case on record wherein pipes, through which steam passes, have actually set fire to woodwork, and no one experimenter has yet succeeded in igniting wood with such pipes. We maintain that any man of science who has studied the subject of steam, or any practical engineer of common sense, knows that all that steam can do, even when superheated, is to make the woodwork hot and dry, and to pre-dispose it to catch fire. The spark must be supplied from another source; the steam tubes can never attain, outside the heating apparatus, the high temperature of 900° or 1,000° Fah. required for the red heat which is necessary to set woodwork on fire.

In this city many of the steam heating apparatuses are worked on a pressure not above 10 lbs. per square inch, in excess of atmospheric pressure, which gives a heat of 241° F. for the water in the boiler, and a somewhat less heat, of course, for the steam which circulates through the pipes. In the majority of buildings heated by steam, a common boiler is used, from which steam-pipes are carried through the premises, and an ordinary pressure for each boiler is 40 lbs. per inch, which gives a heat of 259° F. At a pressure of 120 lbs. above the atmospheric pressure, we have a heat of 355°. It will thus be seen that at pressures far above any that are used for heating purposes the heat circulated in the steam-pipes is much below that required for the ignition of wood.

That steam-pipes predispose woodwork to combustion, and even may assist the spontaneous combustion which is apt to commence in rags soaked with any animal or vegetable oil, cannot be denied; but then any heating apparatus will do the same, and steam is in this respect not so dangerous as a draft of hot air proceeding from a furnace, in which a leak may carry a spark upward, while a leak from a steam tube is utterly harmless. In regard to spontaneous combustion, any danger of that, from oil, may be avoided by using for lubrication the heavy lubricating petroleum. This material is not apt to oxidation or spontaneous heating, as one of our esteemed correspondents discovered and published in our paper several years ago; which valuable property is now also being publicly recognized in Europe.

The subjoined is a not uncommon instance of spontaneous combustion; but the conditions are such as are quite too little heeded:

Several weeks ago the new stable of S. S. Metzger took fire and burned to the ground in the midst of a drenching rain; no fire had been used about the building, and there was no way of accounting for the origin of the fire but by attributing it to an incendiary or to spontaneous combustion. The men engaged in painting and finishing Metzger's new house had been graining shutters for the house in the stable during the day before the fire, but it was scarcely thought possible that the fire could have originated from that source. The stable having been burned, the painters next day transferred their graining to the cellar of the house. That evening the inmates of the house discovered a smoke and a smell of burning cotton or paper issuing from the cellar. An examination disclosed the fact that the oiled rags used by the painters in graining had been thrown together in a corner and had ignited by spontaneous combustion, and were just burning into a flame. This timely discovery saved the house and settled the question as to the origin of the fire in the stable. Next day a nail keg was partly filled with the oily rags cast away by the painters and set in the sunshine in the yard. In a few hours the rags and keg were found to be on fire. Very few people are aware of the dangers arising from such a source.—Bedford (Pa.) Enquirer.

COAL IGNITING BY PRESSURE(?)—We often hear of coal, highly charged with sulphur and iron, taking fire from the addition of a small amount of moisture, kept short of the point of saturation; but we infer that the coal heap referred to below was not subjected to such conditions.

A Chicago paper of recent date says that the Chicago Gas Light and Coke Company received, during the summer, 10,000 tons of Pittsburgh coal, which was stored in an immense shed at the works, near Division street bridge. On Friday morning of last week flames issued from the heap, and it was soon apparent that the lower stratum was on fire, caused, it is supposed, by the great pressure producing spontaneous combustion.

The Retention and Coloring of Eggs and the Mimicry of Sounds by Birds.

A correspondent of *Nature* forwards the following interesting facts observed in New Zealand: Regarding the length of time during which a bird can retain its egg, the case is mentioned of a kingfisher that began six nests, abandoning all in turn and depositing her egg in the seventh, after working for six weeks in a condition analogous to pregnancy. The labor was incessant, three of the homes that were excavated in a turf chimney and abandoned being so far finished that a deposit of eggs must have been imminent on three occasions during the above period.

In answer to the question: Can a bird influence the color of its eggs protectively? the writer says that a female bittern, when kept in a grassy enclosure, laid an egg of a pale bluish green color, precisely like that of a heron. The egg of the bittern naturally is of an oliveaceous buff tint, which harmonizes well with the half-dead leaves of aquatic plants, of which the nest is often built. It is, doubtless, probable that the egg thus became tinged to secure for it the protection of the verdure of the grass in which it was deposited. Another and more curious instance is that of the whistler, or small cuckoo placing his egg in the nest of the blight bird. The latter is a bird foreign to New Zealand and builds a suspended nest; the eggs are clear-blue green in color. The egg of the cuckoo is greenish-dun, but in order to place it in the hanging nest, where it will be free from reptilian invaders, the writer has found cases where it has manifestly changed the color to one closely resembling that of the eggs of its dupe, so that the latter would fail to distinguish the addition to its deposit.

Referring to the mimicry of sounds, it is stated that, in camping for some days on a river-bed, the author frequently heard what he took to be one of the notes of the *hamatopus*, but that wader was nowhere to be seen; at length he traced the call to the pipio, a bird with feeble powers of flight, yet one that delights in the open glades of river beds. The mimic cry was always given when near to a stream, just where the redbill (*hamatopus*) would be likely to be found. A pair of redbills can drive away a hawk; now a hawk, "from his place on high," perceiving something near the water, might forego its swoop on hearing the mimicked note of the wary yet bold redbill. The common gray warbler, it is also stated, gives an exact imitation of the cry of the common tern, one of the boldest birds in defence of its young.

Spontaneous Combustion.

With many of the various ways by which spontaneous combustion may be effected, the public are already familiar; but late observations have developed some comparatively new sources of danger in this direction, which may be instanced in the following paragraph which we have clipped within a few days from our exchanges:

A NOVEL CASE OF INCENDIARISM, AND SOMETHING NEW IN OPTICS.—The *Industrial Monthly* says that "A mysterious fire, which twice in one day came near burning up a house in Guilford Conn., was finally traced to some tin pans, from which the rays of the sun had refracted with sufficient intensity to start a blaze at a focus some distance off." This was certainly a new way of setting a house on fire; and if, as our cotemporary states, the rays were refracted by the tin pans, it was an optical anomaly of which we wonder that he did not suggest some explanation.

OSCILLATION has a wonderful effect upon even powerful bodies if not frequently broken in the vibration. We have frequently seen notices placed at the ends of large suspension bridges, that processions must break step in crossing; this has to be done to ensure safety.

It is stated in illustration of the effect of the phenomenon in question, that when the first suspension bridge was building in England, a fiddler offered to fiddle it away. Striking one note after another, he eventually hit its vibrating note, or fundamental tone, and threw it into such extraordinary vibrations that the bridge builders had to beg him to desist. Only recently a bridge went down under the tread of infantry in France who had not broken step, and three hundred persons were drowned. The experiment is well known of a tumbler or small glass vessel being broken by the frequent repetition of some particular note of the human voice.

TO BLACKEN BRASS.—Warm the brass over the flame of a Bunsen burner or a spirit lamp, and plunge it while hot into nitric acid for two or three seconds. Then return it to the flame, and heat it till it blackens, brush off blisters, and lacquer. Another way is to use a liquid containing two parts of arsenious acid, four parts of hydrochloric acid, and one part of sulphuric acid, in eighty parts of water.

Zinc may also be given a fine black color by cleaning the surface with sand and sulphuric acid, and immersing for an instant in a solution composed of four parts of sulphate of nickel and ammonia in forty of water, acidulated with one part of sulphuric acid, washing and drying. The black coating adheres firmly, and takes a bronze color under the burnisher.

GOOD HEALTH.

The Blood-Circulation and Heart Disease.

Dr. Black, in the *Popular Science Monthly*, explains very clearly the nature and causes of heart-diseases, and refers it largely to the breathing of vitiated air. What he says about the relation between the blood and the diseases of the heart is worth special attention.

The third great vital function which influences the degenerative tendency of the heart is that of the circulation of the blood. To preserve the health of the tissues, the blood must not only be pure and rich in the materials of growth, but it must flow with a certain speed through all the blood-vessels. If the speed with which the blood moves is on the side of either *plus* or *minus* of the standard of health, disease will shortly arise. If it is on the side of *plus*, active disease of the heart, where that organ is the one to suffer, will follow. If on the side of *minus*, tissue degeneration will ensue. Active diseases will be the consequence before middle age; degeneration after that period.

These facts teach that all violent and long-continued efforts of the body should be avoided. They hurry the heart's action to an inordinate degree; they cause it to throw the blood with great force into the extreme vessels; and, as there is almost always one organ of the body weaker than the others, the vessels of this organ become distended, and, remaining distended, the organ itself becomes diseased. Running, rowing, wrestling severe horse-exercise, cricket, foot-ball, are fruitful causes of heart diseases. Those which require the breath to be suspended during their accomplishment are more fruitful causes in this respect than those, which require no such suspension of breathing. Rowing, lifting heavy weights, wrestling and jumping do this; and of these, rowing is the most powerful for evil. At every effort made with the hands and feet, the muscles are strained to their utmost; the chest is violently fixed; no air is admitted into the lungs; blood is thrown by the goaded heart with great force into the pulmonary vessels; they become distended; they at length cannot find space for more blood; the onward current is now driven back upon the right heart; its cavities and the blood-vessels of its walls become in like manner distended; the foundation of disease is laid. Hypertrophy, hemoptysis, inflammatory affections of the heart and lungs, are the consequences in the young; valvular incompetency, rupture of the valves or of the muscular fibers of the heart, pulmonary apoplexy, and cerebral hemorrhage, are too frequently the immediate consequences in those of more mature years.

Removing Pimples from the Face.

First, be assured what will not "remove pimples from the face." No drug, either administered to the stomach or locally applied, will do it. Neither will any mere local means whatever have the desired effect. The only course which promises success is purely hygienic, and has reference to the general health with the view of improving the face indirectly. Give every attention to pure air, plenty of sunshine, proper food, due exercise and thorough cleanliness. Two things are particularly important: 1. The skin must be made to do extra duty, and to this end bathe it quickly all over every morning in a little cold water, rubbing it until quite red. Two or three times in the week use soap freely. Not one person in a hundred, even of those who pretend to bathe often and much, keeps himself decent under the armpits, over and between the shoulder-blades and down the back. Think, therefore, especially to bathe and scrub and rub the parts you are most likely to neglect from their being difficult to reach. 2. Eat one-third less at each meal than you have been accustomed to eat—that is, as little as you can get along with, without actual suffering from the seeming need of food. Food should be plain and nourishing—no pastry, no nuts, no grease in any form, unless sweet butter in very moderate quantity. Avoid salt, except what comes cooked in the food, and avoid for the most part acids which will preclude the use of all fruits, except as they are cooked. The paramount points may be stated in a line when we say: Bathe much; breathe much; eat little and well; avoid pastry, grease, nuts, salt, and largely acids.—*Dio Lewis*.

WOMAN'S DRUDGERY.—The hygienic system is pre-eminently the cause of woman—both as respects the preservation of health and the treatment of disease. A simple and wholesome plan of cooking would relieve her of one-half of her present hard toil and drudgery, while it would promote the health of every member of her household. At least four-fifths of all the money expended for medicines and medical advice, are paid because of the diseases of women and children. And, nine-tenths of all the care, nursing, night-watching, and privation of sleep and rest because of sick children, are performed and suffered by women. The Medical Society in New York, which, on one of its occasions toasted woman in the following words, had truth if not poetry as the basis of the sentiment.

"Woman—God's best gift to man, and the chief support of the doctor."—*Science of Health*.

Kerosene Oil in Chronic Rheumatism.

Dr. Kemp, of Wellington, New Zealand, relates several cases that have lately come under his notice, in which the internal administration of kerosene oil has had the most marked effect on chronic rheumatism. The following is one of his cases:—J. H., aged forty-six, a sailor, had suffered from chronic rheumatism for twenty years. He never had an acute attack. He used to have agonizing twinges in his feet and legs; he compared the pain to that which would be produced by the skin being seized by a pair of tweezers and forcibly pulled. The attacks would come on about every ten minutes, and often for every three or four days and nights. He had been under medical treatment for many months, but never had more than temporary relief. He began to feel the intervals between the attacks lengthen in six weeks after commencing kerosene, and in less than three months the pains had entirely left him. After discontinuing it for some time, the pain slightly returned, but was always cured by taking two or three doses. A teaspoonful was taken in a wine-glass of water every other night. The kerosene produced no unpleasant symptoms, no loss of appetite, no effect upon the bowels or kidneys. Dr. Kemp observes, that although kerosene cannot be called a specific for rheumatism, he thinks that the cases he cites are quite sufficient to induce medical men to give it a fair trial. He is unable to find any unpleasant symptom caused by taking kerosene. The great objection with many people to taking it is the unpleasant taste and smell. Some have taken it in water or milk, but he had heard a patient say he could take it best with salt; a pinch of salt being put in the month and allowed to dissolve, and the oil then swallowed, mixed with about its bulk of water. Dr. Kemp is not aware of the remedy having ever been used internally, but he hopes some medical man will be found who will give it a trial, and record the results of their cases. Externally, it is of great use in cases of burns, whether severe or slight; it seems to relieve pain more than any other application, especially if resorted to as soon as the injury is received. Cases of severe burns have been known to heal up rapidly under its use alone.—*British Medical Journal*.

Wholesomeness of Food.

The wholesome or unwholesome character of any aliment depends, in a great measure, on the state of the digestive organs in any given case. Sometimes, a particular kind of food is called wholesome because it produces a beneficial effect of a particular character on the system of an individual. In this case, however, it is to be considered as a medicine, and can be called wholesome only for those whose systems are in the same condition. Very often a simple aliment is made indigestible by artificial cookery. Aliments abounding in fat are unwholesome, because fat resists the operation of the gastric juice. The addition of too much spice makes many an innocent aliment injurious, because spices resist the action of the digestive organs, and produce an irritation of particular parts of the system.

In any given case, the digestive power of the individual is to be considered, in order to determine whether a particular aliment is wholesome or not. In general, we can only say, that aliment is healthy which is easily soluble, and is suited to the power of digestion of the individual; and in order to render the aliment perfect, the nutritious parts must be mixed up with a certain quantity of innocent substance affording no nourishment, to fill the stomach; because there is no doubt many persons injure their health by taking too much nutritious food. In this case, the nutritious parts, which can not be dissolved, act precisely like food, which is, in itself, indigestible.

It is a very mistaken idea that the nourishment in food is according to the quantity; a person may eat a great deal of some article, and receive very little nourishment from them. The quantity of nourishment depends greatly on the aromatic flavor contained in food and whatever is insipid to the taste is of little service to the stomach. Now, the difference between good cookery and bad cookery lies principally in the development of the flavor of our food; articles properly cooked yield the whole of it; by good cookery we make the most of everything—by bad cookery, the least.—*American Rural Home*.

FATAL FLY BITES.—Deaths very frequently occur from slight punctures made by flies in warm climates. Occasionally such cases occur in temperate zones, but the cause of such a melancholy result from a slight wound in the skin does not seem sufficient to produce excessive swelling, pain, discoloration and other extraordinary appearances which are quickly exhibited. It is, therefore, possible that the insect which makes the tiny wound has its proboscis charged with an active poison from some source where it had recently been foraging, which introduced into a bleeding wound and rapidly carried by the absorbents into the system, is followed by death.

Observation on those forms of ophthalmia so common in Egypt, ending in blindness of one if not both eyes, leads to the opinion that the dreadful malady is propagated by flies, carrying on their feet and feeding tubes, purulent matter from diseased organs whence they are kept away with difficulty, to sound ones, where they are attracted by moisture on the margin of the lids.—*Ec.*

MINING & SCIENTIFIC PRESS

B. EWER,.....SENIOR EDITOR

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG,
W. S. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

San Francisco:

Saturday Morning, Feb. 15, 1873.

Legal Tender Rates.—S. F., Thurs., Feb. 13.—buying 88½; selling 88¾.

Table of Contents.

GENERAL EDITORIALS.—Foundry Work; Effluence of Silver, 97. Progress at the Rolling Mills; Craig and Craig vs. Fisher—Hydraulic Nozzles; Changes under the New Code Affecting Business Transactions, 104. The Hyde Steam Flow; Geology as a Branch of Education; The "Creeping of Rails," 105. **ILLUSTRATIONS.**—Erbank's Method of Ventilating Mines, 97. Smith's Fire Kinder, 105. **MECHANICAL PROGRESS.**—New Use for the Steam Jet; Improvement in British Artillery; Origin and Progress of Hot Blast Furnaces; The Influence of the Hot Blast; The Pneumatic Tube to be Tested; American Shipbuilder, 99.

SCIENTIFIC PROGRESS.—Contortion of Rocks; Determination of Mercury in Its Ores; Astronomical Prize Award; Scientific Prize Awards; How far Can We See; The Ancient "Atlantis"; The Oxy-Hydrogen Light; Scientific Experiments with Iron; New Mixture for Crucibles, 99.

USEFUL INFORMATION.—Mysterious Fires; Coal Ignited by Pressure; The Retention and Coloring of Eggs and the Mimicry of Sounds by Birds; Spontaneous Combustion; Oscillation; To Blacken Brass, 103.

GOOD HEALTH.—The Blood-Circulation and Heart Disease; Removing Pimples from the Face; Kerosene Oil in Chronic Rheumatism; Wholesomeness of Food; Fat 1 Fly Bites, 103.

MINING.—SIC PROGRESS from various counties in California, Nevada, Arizona, Montana, Oregon and Lower California, 100-1.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 84.

MISCELLANEOUS.—Auriferous Gravel in Placer County; Resources of Utah—Continued; Letter-Boxes in Street Cars; A Mining Marvel; Wooden Railroads; Sutter Canal and Mining Company, 98. S. F. Prices Current, 102. Laws Under New California Code; Principal Imports, with Quantities and Values for the year ending Dec. 31st, 1872; Detailed Account of Exports from San Francisco to various Countries for the Year Ending December 31st, 1872; Steel Rails, 108.

PRACTICAL CHEMISTRY.—The fifth of the Polytechnic course of lectures was delivered on the 6th inst., by Lonie Falkenau, State Assayer, on "Chemistry in the Arts." We regret that want of space forbids our publishing even an abstract of his remarks.

PROSPECTORS.—Numbers of miners are leaving Ely District daily for Death Valley and for Sacramento District, Arizona, on prospecting expeditions. With a few thousand more brave and hardy miners in Arizona, the Apaches will have to leave the more thickly settled portions of the Territory and take to the mountains.

WM. M. LENT, who went East some time since to catch Arnold, the Arizona diamond sharp, has returned to this city after an unsuccessful hunt. Mr. Lent persistently refuses to be interviewed, so the details of his trip are unknown to the public.

MINT APPROPRIATIONS.—The appropriation for the Carson Mint as fixed by the Senate amounts to \$138,000 which is yet to be occurred in by the House. The appropriation agreed upon for the San Francisco Branch Mint by both House and Senate is \$290,045.

MINING SALE.—A half interest in the St. Lawrence mine, El Dorado county, has been sold to an English company; reported consideration, \$800,000.

CHARACTERISTIC REWARDS OF MERIT.—Miniature silver bricks are said to be presented to the school children at Virginia City, for excellence in deportment, etc.

THE GOULD & CURRY MINING COMPANY are going to burn coal at their hoisting works, owing to the scarcity and high price of fuel.

THE LOS ANGELES PLACER MINES, in the San Gabriel, will do better since the late rains.

ON FILE.—Letter from Forest City.

Progress at the Rolling Mills.

The Pacific Rolling Mills, of this city, are the only works of that character on the coast and as such represent a very important branch of industry. They manufacture railroad and merchant iron, steamboat shafts, cranks, pistons, connecting rods, car and locomotive axles and frames, and hammered iron of every description. They have lately been making considerable additions to their machinery, etc., in order to keep up with their orders. The mill is now quite busy, running nine furnaces on iron besides those on holts, spikes, etc. They have three trains of rolls, two 18-inch and one 8-inch train, driven by an engine of 200-horse power. Since our last visit they have added a new rivet machine and one large punch, capable of punching a nut for a 1½ inch rod, cold. Also two small punches for washers and small nuts. This makes altogether seven punches on the latter class of work. An axle turning lathe and an axle centering lathe for cutting off any shafting cold, have been added, made at Bement & Dougherty's Industrial Works at Philadelphia. A new bolt header, that will make a bolt from ¾ of an inch to 1½ inches, is running, and four machines for cutting holts have lately been added, making altogether in the holt shop nine machines. They employ boys altogether in this department, there being, with those in the mill, 25 employed. They have just built a new machine for cutting threads in nuts that allows one boy to run 12 taps.

Three large warehouses were built last fall in which surplus stock is stored. They are conveniently situated, having a water frontage so that material can be taken into schooners or barges. The company are continually making additions to the works and are now able to turn out all railroad iron needed for the many narrow gauge railroads projected on this coast, so incorporators will please bear this fact in mind and not send East for it, but patronize home manufacturers. They have just finished a piston rod, 11 inches in diameter, for the cylinder of the steamer "Arizona," the nut on which weighed 1,200 pounds. Narrow gauge iron from 16 to 20 pounds to the yard, is being made and stacked for future emergencies. The rails for the Seattle Coal Mining Company's road, 16 miles long, were made at this mill. The rails weighed 16 pounds to the yard over which they run a seven-ton locomotive. They also made 20 miles of rail for the Nevada Central, or as it is better known, the Pioche and Bullionville railroad. These were 20 pounds to the yard; gauge 3 feet. There were about 600 tons altogether. The Black Diamond Coal Company also use this 20-pound rail on their road. The popular size for mining purposes is 16-pound, and most of the mining companies use it.

They make a specialty of stamp stems for quartz batteries which are made of three sizes, 2½, 3 and 3½ inch iron. This is kept on hand cut in lengths. The iron is made particularly for that purpose. They are now turning out nearly 40 tons per day of bar iron, and are working night and day shifts. Nine furnaces are running with four on bolts, railroad spikes, etc. About 70 boxes of railroad spikes, 30 boxes of rivets and 50 boxes of fish-joint bolts per day are turned out, the latter finished with thread and nut. In the machine holt line they can turn out 4,000 bolts per day with nut and dressed head. There are now on the dock upwards of 150 tons of fish plates and bolts for the Central Pacific railroad. Wrought iron drawheads, or humpers, are being made for the cars on the heavy grades of the Virginia and Truckee railroad; also nuts, holts, washers, flat and round iron, etc. The shoe shapes are made of the best imported Norway iron.

About 35 tons of coal per day are used at the works, all of which comes from Australia in vessels and is unloaded at the dock in front of the mills. There are five steam hammers and five engines in the mills and 11 boilers; one new boiler is now being made. Steam is made in most of them from the fire in the furnaces at no additional cost. About 250 men are at work at present in all the departments, including the bolt, forge, blacksmith, carpenter shop, etc. Rails were made at these mills for the California Pacific, Stockton and Copperopolis, North Pacific, and Oregon and California railroads. A 11-ton shaft for the steamer "Orizaba" was recently forged here which was finished up at the Risdon Iron Works.

The mills of the company are situated on the

Portrero where they have spacious grounds and a fine water frontage. They are under the superintendence of Mr. B. P. Bruner, and L. B. Benchley is business manager. The amount of business done has increased very materially within the past few years and with it the facilities for turning out a variety of work have been proportionately increased. The mills now present a very busy appearance and are well worth a visit. The forbidding notice at the entrance of "no admittance without permission from the office," has reference only to constitutional idlers, but either of the young gentlemen in "the office," Messrs. Keeney, Noble or Dana, will readily allow the curious to visit the works.

Craig and Craig vs. Fisher—Hydraulic Nozzles.

Peculiar complications frequently result where several independent inventors are seeking to supply a decided want, which has been developed in some trade or profession. The improver of a prior patent must, according to law, obtain the right to use the arrangement covered by the original patent, and as it often happens that the improvement is just as necessary to the original machine as the original machine is to the improvement, a game of "freeze out" or rather "law out" is commenced in which the longest purse wins the race. In this "game" the original patentee has the advantage, because he is supposed to be the originator or "father" of the idea, and although the improvement shows just as much originality and intrinsic value as the original invention, it must be laid upon the shelf unless the original patentee is gracious enough to yield a point *pro bono publico*. This "freeze out" game has been exemplified in the cases Craig and Craig vs. Thom and Allen, and Craig and Craig vs. Fisher, which have been assuming all the various phases of infringement suits, injunctions, cross-suits, contempt cases, etc., for the past two years.

The latest phase of this long-winded case is the incarceration of Mr. F. H. Fisher, the inventor of the Hydraulic Chief Nozzle, in the Santa Clara county jail, and a fine of \$500 for an alleged contempt of Court, in disobeying an injunction restraining him from manufacturing Hydraulic Nozzles having internal radial plates for straightening the stream of water. It was shown that Mr. Fisher purchased old nozzles upon which the royalty had once been paid to the patentee, and after removing the radial plates placed them in his new nozzle pipes, and sold them with his new machines. This Judge Sawyer declared to be an infringement of the rights of the patentee, and a violation of the injunction, hence the sentence. We are sorry to see a fellow citizen immured in jail for a minor offence, which might be just as well punished by a simple fine, but the very severity of the sentence will perhaps serve as a warning to others who might be liable to labor under a similar misunderstanding of the law. If Judge Sawyer had not interpreted the law for us and given us this example we confess that if circumstances had ever placed us in Fisher's condition we would most likely have had to suffer the same punishment, for we would not have hesitated to do as he did under the impression that we were doing nothing wrong; and we would have based our opinion upon the Law of Patents, which declares that when a machine or product which is made under a patent has once paid the patentee his royalty, it becomes an article of commerce and trade, and is liable to no further taxation in favor of the patentee. We are glad to know, however, that this clause of the law is interpreted to mean that a patentee can arrest and punish any one he finds remodelling, repairing or altering his machines, even if the royalty upon it has once been paid.

We do not take issue with Judge Sawyer in his interpretation of the law, on the contrary, we are bound to take his opinion as the proper one until it is reversed by the decision of a higher tribunal. We understand that Fisher's attorney intends to appeal the case of Craig & Craig vs. Fisher to the Supreme Court, but this will not affect the fine and imprisonment for contempt. We shall watch with interest the future developments of this case, as it promises to be both instructive and interesting.

UTAH RAILROAD AND MINING COMPANY.—A dispatch from Washington states that a bill has been introduced in the House to incorporate the Utah Railroad and Mining Company, with a capital stock of \$5,000,000, divided into shares of \$100 each. The object of the company is to develop the mining resources of Utah by constructing narrow-gauge tramways and telegraph lines so as to connect the mining districts of Stockton, Rush Valley, Ophir and Camp Floyd with a convenient point of the Utah Southern Railroad at or near Lehigh. The company is to have the right of way across the public lands of the United States not exceeding two hundred feet in width.

Changes Under the New (Cal.) Code Affecting Business Transactions.

Aware that important changes have been made in the laws of California, under the New Code, taking effect January 1st, 1873, we have requested our confidential attorneys (Messrs. Gray & Haven), to furnish us hints sufficient to warn business men from many difficulties they might likely incur without such knowledge. They have given us the following to commence with:

How the New Code Affects Business Matters.

It is impossible to state, in one article, the changes made by the new Code, for they are numerous, and extend to every branch of the unwritten law. We propose to refer briefly to some of the more prominent provisions in the new Code, which affect business transactions. Some of these are simply declaratory of the unwritten law, and some are radical changes. All distinctions between sealed and unsealed instruments are abolished.

A contract is to be interpreted according to the law and usage of the place where it is performed; or, if it does not indicate a place of performance, according to the law and use of the place where it is made.

If the terms of a promise are in any respect ambiguous or uncertain, it must be interpreted in the sense in which the promisor believed, at the time of making it, that the promisee understood it.

Time is never considered as of the essence of a contract, unless by its terms expressly so provided.

Every contract by which one is restrained from exercising a lawful profession, trade or business of any kind, is void, except in two cases, viz.: 1st. One who sells the good will of a business, may restrain himself from carrying on a similar business within a specified city or county as long as the buyer or any person deriving title from him, carries on a like business therein.

2d. Partners, may upon, or in anticipation of, a dissolution of partnership, agree that none of them will carry on a similar business within the same city or town where the partnership business has been transacted.

Personal property sold is deliverable at the place where it is at the time of the sale, or agreement to sell, or if it is not then in existence, it is deliverable at the place where it is produced.

One who sells personal property must bring it to his own door, or other convenient place, for the acceptance of the buyer, but further transportation is at the risk and expense of the buyer.

One who sells personal property knowing that the buyer relies upon his advice or judgment, thereby warrants to the buyer that neither the seller, or any agent employed by him in the transaction, knows the existence of any fact concerning the thing sold which would, to his knowledge, destroy the buyer's inducement to buy.

One who sells any article to which there is affixed a trade mark, thereby warrants that mark to be genuine and lawfully used.

One who makes a business of selling provision for domestic use warrants by a sale thereof, to one who buys for actual consumption, that they are sound and wholesome.

One who sells the good will of a business thereby warrants that he will not endeavor to draw off any of the customers.

Days of grace on negotiable instruments are abolished, and the apparent maturity of any negotiable instrument, payable at a particular time, is the day on which, by its terms, it becomes due, or when that is a holiday, the next business day.

A bill of exchange, payable at a certain time after sight, which is not accepted within ten days after its date, in addition to the time which would suffice with ordinary diligence, to forward it for acceptance, is presumed to have been dishonored.

The apparent maturity of a promissory note or bill of exchange payable at sight or on demand, is one year after its date, if it bears interest. A promissory note, payable at sight, or on demand, which does not bear interest, matures six months after its date. From the date of apparent maturity the Statute of Limitations commences to run against these instruments.

The indorsement of a promissory note payable on demand or sight without interest, is exonerated, if the note is not duly presented for payment within six months from its date, unless such presentment is excused.

SUTRO TUNNEL.—The Committee on Mines and Mining in Congress have reported in favor of the Government siding the Sutro Tunnel by a loan of \$2,000,000. A minority report was submitted by Mr. Sargent claiming that the bill proposed giving money to private mining enterprises and would destroy property of others amounting to over \$12,000,000. This meant probably the fears of the growth of a new town at the mouth of the tunnel which would depreciate the value of property in Gold Hill and Virginia. Mr. Sutro is at last successful in a measure at least, since the Committee have reported favorably on the bill, and his indefatigable energy will doubtless assist in pushing it through.

Geology as a Branch of Education.

Without underrating in the least the value of mental and moral science, we propose to speak of Geology as an instrument of education. We believe it has a fitness in this respect not possessed by any other single science. Astronomy may have a more majestic sweep, but geology dives deeper and brings up this key to God's older revelation. It is a great feat to measure a planet, but to tell its genesis and genealogy is a greater. "Geology, in its highest sense, is not so much one science, as the application of all the natural sciences to the examination and description of the creation and structure of the earth. It is not a geographical mineralogy, for paleontology is its most interesting feature. It does not consist in the mere collection of fossils for show or classic haphazard; it has a far higher mission than to label phenomena. It is no more a 'heap of facts' than literature is a heap of words; it is an intelligible sentence. Nor does its importance rest upon its practicality. It does indeed unlock the treasures of the mineral kingdom. It is the farmers' and miners' and builders' best friend. It has to do as much with dollars and dimes as the calculation of the banker. Never was anything more clearly made than the intimate relation between the lowest province of political economy and the loftiest reach of scientific investigation. "How effectual and sublime the education of such a science, when the very stones are gifted with a power of exhaustless meaning, and call into action our highest and holiest energies! Not only does geology yield directly a rich harvest of wonderful truth; it also disciplines the mind in a new and living way. He who will follow out the logos of the earth in all its hearings, will reach the full strength and stature of an intellectual man. Who has not felt that the humblest flower asked him questions he could not answer. A host of questions still flock around us as we turn over the rocky leaves of the book of Nature, and put our finger on the very print of that hand that laid the foundations of the earth. Nor does the stream of knowledge stop here; it swells till it spreads itself into heaven. Like the rill which by and by becomes a brook, a river, a gulf, an ocean,—so every attainment promises more. The only positive apology for the man who derides geology as a study is, that he has never taken the first lesson. We repeat the charge that it is a visionary pursuit. Like every other truth—like the sun itself—it did rise amid the mists of the morning; but now it shines unclouded from the zenith. Geology, said Hugh Miller, no longer journeys amid the waste of chaos; it has got firm footing on the continent of fact. It is a philosophy of ascertained laws. Types, classes, orders, families, genera and species, are not mere artificial devices to facilitate study; they are founded in Nature. It is an unfinished science, but for that very reason it is admirably adapted to rouse the whole energy of the student. It presents the finished outline of a landscape of untold wealth.

We ask for geology a prominent place in the curriculum of our colleges and schools. How woefully ignorant of nature are many of our graduated men. Nature—the very book whose letters are largest and the only gospel now preached to every creature, is the one in which the mass of mankind read not a lesson, and see not a line. Like Hamlet's ghost, they have "no speculation in their eyes." The sun, coming forth from his chambers and fulfilling his circuit, excites no feeling but that of warmth and convenience. A fossil—the symbol of a divine thought—the sepulchre of a creature that was over the lord of creation—is tossed into a stone-wall without the slightest notice. And yet this lack of observation and reflection is not owing to any deficiency of intellect or taste, but to a neglect or perversion of their powers. The native tendency of the mind is strangled at its birth; the greenness of the Spirit is dried up in the hot race for riches or rank.

A FIRST-CLASS MAGAZINE.—The last two numbers of *Scribner's Monthly* surpass any yet issued in the variety and excellence of the illustrations. The cuts with "New Ways in the Old Dominion" are beautifully executed, as in fact are all that appear in this magazine. The publishers announce a forthcoming series of illustrated papers on "The Great South," by Mr. Edward King. "Arthur Bounicastle," Dr. Holland's story, will be continued through the year. The publishers furnish for \$4 a year a work which contains not only an immense amount of information and pleasant reading, but descriptive illustrations, which gives the general reader a better idea of localities or occurrences than any writing can do.

LECTURE TO LADIES.—Mrs. Dr. E. P. Stone is delivering a series of interesting lectures to the ladies of Oakland on the subject of Physiology. The lectures are plain common sense explanations of anatomy with as few technicalities as possible. Mrs. Stone has a life-size model of a human being which can be taken apart in such a manner as to present to view the structure of the human body in a manner to be understood.

Smith's Fire Kindler.

Everybody knows what a nuisance it is to make a fire early on a cold morning. Something which tries a man's patience more than anything we can think of. You get your hands dirty, perhaps cut your fingers in whittling up shavings to start it, and after all it may go out and have to be made all over again. When people try to start one quickly by pouring coal oil upon it they frequently furnish an "accident" item for the papers, and put their relations to the expense of a funeral. This course is not only inexpedient but expensive. Coal oil starts a fire beautifully, but handled as it usually is, it is extremely dangerous even in the hands of a careful person. But now comes a good Samaritan bearing the somewhat common name of Smith, who invents a little device of practical utility by which coal oil can be used for lighting fires without being in the least degree dangerous.

This invention is represented in the accompanying cut from which its nature can be seen at a glance. A, represents a can for the purpose of holding the coal oil, which is usually kept about half full. B, is a fire-proof porous

substance, which when not in use is immersed in the oil in the can A. C, is a cork, on the other end of the wire holding the substance, B, which prevents the oil from evaporating, or being spilled. The ball, B, becoming saturated with the oil by being kept in it will readily burn with a hot flame when lighted, and it is only necessary to place it under the wood or coal in the stove to light the fire. When the oil is all burned out it can be placed in the can for future use. This little device is one which will be found useful in every family in the land, as it will kindle wood or coal, either coarse or fine in an incredibly short space of time, and one Kindler will last a life-time. The porous substance being fire-proof is indestructible, so all that is consumed is the coal oil. Weister & Co., No. 17 New Montgomery street, are agents for this Coast, and the implement can be examined at their office.

A VEIN OF LIME FOUND IN NEBRASKA.—The Lincoln, Nebraska, *State Journal* says that there has been discovered in Seward county, that State, a vein of lime, seventeen feet thick, which is so free from carbon and other foreign substances that it can be used for plastering without burning, it only being necessary to slack with water and mix with the ordinary quantity of sand. Adjoining the quarries where this discovery was made a town has been laid out, which is called Pittsburgh, and a number of houses erected, all of which are plastered with the lime from the vein near by. In the same quarries a stratum of silicate of magnesia was found, which is pronounced by experts to be equal, if not superior, to the silicates of New Jersey, which are used extensively in the manufacture of glass and for glazing pottery. Careful analyses are being made of these and other substances found in the vicinity.

As lime in the condition above referred to will slack on the application of water, we suppose we are to accept as a consequence of its existence there the fact that "Seward County," Nebraska, is never blessed with rains, and that the soil there is always as "dry as a limekiln." These conditions being admitted, we are willing to receive as truth the above assertion, without the further evidence of the "careful analyses" alluded to as "being made."

NEW FLUME.—A flume will be built next spring from Lake Tahoe to Truckee, following the course of the river; length, fifteen miles. The flume will be built for the purpose of floating lumber, railroad ties, mining timber, wood and shingle blocks.

EXPLOSION.—Last week the cupola of the melting furnace at Taylor's foundry, at Grass Valley, was blown off. Bricks, etc., were hurled a distance of 300 yards, and several parties slightly but not seriously hurt.

A NUGGET, worth \$450, was picked up last week in Wyman's Ravine, on the Garden Ranch. It was found in tailings thrown out by Chinamen, who paid \$2,500 for a claim of two acres.

The "Creeping" of Rails.

A correspondent of the *Railroad Gazette* notes the following curious facts, for which he asks an explanation: Four hundred and fifteen miles of track, on a road running north and south, were laid, between 1850 and 1861, with the fish-bar joint fastening, similar to that now in general use. The differences in the elevations of the north and south ends of the track does not exceed 150 feet—the southern end being the lowest—and the grades undulate; but at no point is a greater elevation attained than 200 feet above or 125 below the southern end. On about one-half of the distance the track was laid with both rail joints on the same cross tie, and the balance with "broken joints." The rails were not "slotted," neither were any "stop chairs" used to prevent the track from "creeping." The track has been in use from 11 to 20 years, and the creeping of both rails has been southward, and the western has crept much faster than the eastern. In places where the grade does not exceed 5 to 8 feet per mile, for 20 to 30 miles, the joints of the western are now opposite to the center of the eastern rails, while the latter have also moved southward. On the heaviest grades descending northward, there is little or no tendency to move down hill or northward. Perhaps some of your readers can explain why the western rails creep faster than the eastern.

Having seen the above paragraph copied into several of our technical journals without any answer to the query propounded, we will venture the application to the "creeping" of rails on roads running north and south, the same theory that is given as a cause for the more rapid wearing away of the western banks of rivers, which run south or north, viz:—the rotation of the earth on its axis. This movement, being from west to east, has a tendency to throw the waters of rivers running parallel with the earth's axis against their western banks; and hence the more rapid wearing away on that side.

So of a railroad train, the eastward motion of the earth, in its daily revolution, presses the flanges of the wheel against the west rail, and causes it to move either north or south, according as the excess of transportation is in the one direction or the other, or as the north or south end of the road is more or less elevated than the opposite extreme. In the case cited, the southern end of the road being some 150 ft. lower than the northern the rails very naturally move down hill. The fact that this motion in railroads, can be accurately determined, may be considered not only as positive proof of the supposed action of the water upon river banks; but also of the truth of the theory generally accepted as its cause.

Mineral vs. Town Sites.

The following letter was recently received at the United States Land Office in reply to a letter addressed to the Commissioner of the General Land Office.

DEPARTMENT OF THE INTERIOR,

GENERAL LAND OFFICE,

WASHINGTON (D. C.) January 21, 1873.

Register and Receiver, Sacramento, Cal.—GENTLEMEN: In your letter of the 7th of September last, you state that on the 10th of October, 1871, Charles Nagler et al. filed in your office an application for patent for a Placer claim, situated in section 13, township 12 north, range 9 east, and section 18, township 12 north, range 9 east, Mount Diablo meridian, and that on the 13th of the same month Charles F. Irwin, County Judge of El Dorado county, Cal., filed with you his declaratory statement No 3,173, claiming certain lands as a town site, in trust for the inhabitants of the town of Greenwood, about thirteen acres of which is embraced by the said application of Nagler et al.

In view of these facts you ask if said applicants will be allowed to make entry of their said mining claim.

The town site Act of March 2, 1867, expressly declares "that no title shall be acquired under the provisions of this Act to any mine of gold, silver, cinnabar or copper," and the Act of June 8, 1868, declares that "no title under said Act of March 2, 1867, shall be acquired to any valid mining claim or possession held under the existing laws."

If, therefore, Nagler et al. have a bona fide mining claim, which they held by virtue of compliance with the local laws and regulations and the congressional enactments, situated within the exterior boundaries of the premises embraced by said town-site application, they will be allowed to enter the same upon full compliance with the law and instructions.

You will inform all persons in interest and acknowledge the receipt hereof.

Very respectfully, your obedient servant,
WILLIS DRUMMOND, Commissioner.

THE MINING LAW.—A bill has been reported in the Senate of the United States by Mr. Hamlin, from the Committee on Mines and Mining, providing that the fifth section of the mining act of May, 1872, in relation to the expenditure of labor and improvements on claims located prior to that act, shall be so amended as to extend the time for the first annual expenditure on such claims until December 1st, 1873.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Feb. 11th, 1873.

FOR WEEK ENDING JANUARY 28th, 1873.

FILTER.—Prosper Huerns, S. F., Cal.
CULTIVATOR.—Amos B. Colver and John Priest, Albany, Oregon.

"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency."

Hydes' Steam Plows.

Mr. Oliver Hyde of this city, inventor of Hyde's patent steam plows has completed this week a very large plow, which is to be tested on the tule lands of the San Joaquin. One of them has been used this season on Putah Creek, Solano county, in ordinary ground, and performed its work satisfactorily, but was compelled to stop since the roads became so bad they were unable to haul fuel for the engine. The new plow is the largest yet built, being 40-horse power. The machine is about 20 feet long by 8 feet wide, and from the ground to the top of the smoke-stack is 12 feet. The front wheels are 6 feet in diameter and 24 inches wide. The hind wheels are 6 feet in diameter by 30 inches wide. These wheels are made after Mr. Hyde's patent, and have rubber rolls, on top of which are secured blocks of wood so that when the weight of the plow is upon them they flatten down considerably and thereby give more surface on the ground than would be the case with a rigid tire in a wheel of equal dimensions. They are made of wrought iron, the spokes being of gas pipe, thus ensuring strength and lightness at the same time. The boiler is five feet in diameter and six feet in height, containing 204 tubes. It has patent circulating tubes, consisting of one tube within another, which are also the invention of Mr. Hyde. This is the first application which has been made of this method and the results will be interesting.

The machine is to be sent to Venice Island on the San Joaquin river and will be employed in plowing tule land. The island belongs to J. Mora Moss, Mr. Nicholson and others. Mr. Hyde is certain that it will be able to perform its work as successfully on tule as on ordinary land. The soil at the place where it will be set at work has never been touched. The machine will cut a furrow 9 feet 4 inches in width. The one used on Putah creek was only 25-horse power and cut 7 feet wide. There are two engines on this one, each with a 10 inch cylinder and 12 inch stroke. It has eight plows 22 inches in diameter. On the other one there were only five plows, but they were 30 inches in diameter. These machines are made by the California Steam Plow Company, who operate with Mr. Hyde's patents. The whole thing is made up of a number of California inventions and is particularly applicable for our large ranches. Mr. Hyde will go with this plow to its destination and run it for awhile himself. He is deserving of great credit for the pertinacity he has shown in overcoming the difficulties in bringing the different parts of the plow to perfection, which is evident from a glance at the mechanism of the machine. We hope that it will prove successful in its work for it will undoubtedly be of great benefit to this State.

New Incorporations.

STEVENS' PACIFIC SMOELTING AND M. Co.—Object, to bring into general use and sell Levi Stevens' patents. Capital stock, \$1,000,000. Trustees—L. Ireland, R. M. Shackelford, James Waters, S. C. Abbott and A. Craig. **WATCOBIA M. AND SMOELTING CO.**—Dec. 11. Location: Inyo Co., Cal. Capital stock, \$2,000,000 in shares of \$100 dollars each. Trustees—James Brady, of Inyo, Harry L. Haskell, Camp Independence, Harry C. Egbert, Camp Independence, Wm. Alvord, Nathan Porter, Albert Bierstadt, and John Hewston, Jr., of San Francisco.

PAGE TUNNEL CO.—Dec. 11. Location: Big Cottonwood District, Utah Territory. Capital stock, \$5,000,000 in shares of \$100 each. Trustees—N. Page, L. J. Lewis, George Middlemass, Edward McLean and Stephen W. Howland.

A dispatch from Pioche, Feb. 9th, says: The South Side Mining Co., to operate in Ely District, Nevada, was incorporated here yesterday. Capital, \$3,000,000; Trustees—E. T. Brown, D. C. Clark, Wm. H. Atkinson, Gibson Clark, E. T. Badgley.

INCREASE OF CAPITAL STOCK.—"420" M. Co.—Capital stock increased from \$1,680,000 in 30,000 shares, to \$3,000,000 in 30,000 shares.

ELECTION.—BLOSSOM ROCK M. Co.—Feb. 12: Trustees—A. C. Bassett (President), Peter Short (Treasurer), J. J. Whitney, W. S. Papp, James Wheeler and L. R. Spaulding, Secretary, R. Stevenson.

MINING SUIT.—A suit has been instituted by Michael McCoughlan against the Ophir Mining Company for \$20,000 damages for injuries sustained while coming out of the mine in a cage:

THE largest saw-mill in the world is in Saginaw Bay, opposite Bay City. It has cut 370,797 feet of lumber in a day, and employs 300 men. Since 1865 it has turned out 180,153,917 feet.

DEWEY & CO.,
American & Foreign Patent Agents,

OFFICE, 238 MONTGOMERY STREET, S. F.
The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counselors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,
well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it. Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations. Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing. As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington. When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation. For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim. For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings. For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

DEWEY & CO.,
United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

Vick's
FLORAL
GUIDE
FOR
1873.

This GUIDE is now published QUARTERLY. 25 cents pays for the year, four numbers, which is not half the cost. Those who afterwards order seeds to the amount of One Dollar may deduct what they paid for the GUIDE, as I present it to the customer. The January Number is Beautiful, giving plans for making Rural Homes, Designs for Dining Table Decorations, Window Gardens, etc., and containing a mass of information invaluable to the lover of flowers. One Hundred and Fifty Pages, on fine tinted paper, some Fifty Hundred Engravings, and a superb Colored Plate and Chromo Cover. The First Edition of Two Hundred Thousand just printed in English and German, and ready to send out.
1874-3m-sa JAMES VICK, Rochester, N. Y.

\$1,000 REWARD! For any case of Blind, Bleeding, Itching, or Ulcerated Piles that De Bink's Pile Remedy fails to cure. It is prepared expressly to cure the Piles and nothing else. Sold by all Druggists. Price \$1.00.
C. F. RICHARDS & Co., Agents, corner Clay and Sanson streets, San Francisco, Cal.

Charles Brown, Dealer in Ranges, Stoves, Tinware, and all kinds of Kitchen Utensils, Metal Roofing, Tin, Copper, and Sheet Iron work. Chimney Top put up, and warranted. 724 Market Street, S. F.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

Richardson & Co., Copper Ore Wharves, SWANSEA.

RICHARDSON & Co. have been for thirty years established in Swansea as Agents for the preparation, Sampling, Assaying, and Sale of Copper, Silver, Gold, Lead, Zinc, and all other Ores and Metals, for which they have extensive Warehouses and Wharves under cover, 1,500 feet of Quay Frontage within the Floating Dock, and the most complete Machinery and Appliances. They are also prepared to make advances against Ores in anticipation of realization, and to guarantee all payments when required.

LEA & PERRINS' CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottles.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed. Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worcester; Orosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally.

EUCALYPTUS.
The attention of the Medical profession is respectfully called to the following preparation of this now remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of intermittent and Malarial Fevers, often supplanting the use of Quinine. The paroxysms of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.
FLUID EXTRACT EUCALYPTUS.
This extract represents in a concentrated form the medicinal effects of the leaves of Eucalyptus Globulus.
THE ELIXIR OF EUCALYPTUS.
This compound presents the properties of the leaves in a palatable form and elegant appearance. Dose—One tablespoonful, to be repeated as often as the case demands.
Cigarettes of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc. Prepared and sold by JAMES G. STEELE & CO., Chemists and Apothecaries,
No. 521 Montgomery St., between Clay and Commercial, San Francisco. no28

PACIFIC BRIDGE COMPANY.

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.
C. H. GORRILL, Secretary. W. H. GORRILL, President.

From the Mining Summary in the Gold Hill News of December 28th,
The New Root Boiler
IS A PERFECT SUCCESS.
The saving in the amount of fuel consumed, alone amounting to 30 per cent. less than the cost of running the same machinery with the old style of Boilers.

HALLIDIE'S Patent Endless Wire Ropeway. Covered by Numerous U. S. Patents.

IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.
T. M. MARTIN—My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN, Superintendent, Office, Sept. 23, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway came erected by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and I recommend it to others wishing a cure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully, L. W. COLBATH, Superintendent, Emma Hill Consolidated Mining Co., Little Cottonwood, Utah, Superintendent's Office, Oct. 23, 1872.

T. M. MARTIN, Esq.—Sir: With pleasure I testify to the fact that the endless wire Ropeway (HALLIDIE'S PATENT) built by you for this Company, has been for a month or more in daily operation, and that it answers admirably the purpose of its construction. The structure is put up in a workmanlike manner, the machinery works smoothly and the cable is completely under the control of the brakes, man. In fine, the work in its operations is a success. Respectfully yours, WM. C. CAMPBELL, Clerk of Co. (Signed)

The Vallejo Ropeway.
The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,500 feet in length, and is supported by thirteen stations. The fall in the distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will easily and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one t n and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—*Utah Mining Journal, Salt Lake, Sept. 23, 1872.*
Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee, 112 and 114 California street, SAN FRANCISCO.
Wire Ropeway for hauling from mines, an outfitting power, ship rigging, etc., of all kinds and sizes on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 112 and 114 California St.

Improved Automatic Safety Cage.

[Written for the SCIENTIFIC PRESS by A. BLATCHLY.]

The Comstock lode has been worked on a more extensive scale and to a greater depth in a shorter time than any mine known in the records of mining. It has been systematically worked only about twelve years, and already the greater amount of ore taken from it comes from over one thousand feet from the surface. If the present efficient system is continued, and even if the Sastro Tunnel should prove of no benefit, in fifty years it will have been worked to the depth of four thousand feet. No mine is worked to that depth at the present time and it is doubtful if but few will ever pay to work so deep, but judging from past developments the Comstock will pay to work to that or even greater depth.

In the future history of mining with the use of modern improvements and those which will be invented, no mine of the precious metals will last a thousand years, like some European mines, unless they are too poor to pay for the application of the most efficient means for operating deep mines. In the Comstock the ore being rich and in large masses it is a desideratum to extract it as speedily as possible. No expense has been spared to obtain the most perfect machinery known to modern mining engineering. Though the pumps are not as large as those required in mines containing more water, still they are made from the best patterns and in the most desirable style of workmanship. The steam engines both for hoisting and pumping are first-class; the blowers for ventilating are those which experience has shown to be the best, the Root having the preference, since being a pressure blower, is better adapted to deep mines than fan blowers.

The safety cages have also received a due share of attention. Every hoisting shaft is provided with guides, on which the cages traverse, and by an arrangement of springs or eccentrics the hoisting-rope is so secured to the cage that if the rope breaks the guides are clutched by the teeth of the eccentric, and the descent of the cage is instantly arrested. Few or no accidents have occurred in the use of this style of cage, unless the brakeman neglected his duty, and the ascending cage, not being stopped at the proper time, ran with great force against the sheave over which the rope runs, breaking the safety arrangement and precipitating the cage to the bottom of the shaft. Several accidents of this kind have occurred, and a number of lives have been lost by them.

The object of the device shown in the cut is to make the action of the engine and brake automatic, after the cage rises to a certain height and the brakeman does not perform his duty.

Our cut represents the mouth of a hoisting-shaft. A is the sheave over which the hoisting-rope runs. B B are levers regulating the action of the hoisting-engine and the brake. D is a weight attached to one end of the double rope X, which passes over the pulleys, c, c, c, the other ends of which are attached to the levers, B B. This rope passes over the shaft at such a height that when the levers B B are operated properly, the top of the cage does not touch it, but if the levers are not operated the cage passes up until it comes in contact with the rope X, which immediately moves the levers and stops the cage, before it rises so high as to do any harm.

The weight D should be of such size as will

give sufficient force to the action of the levers, but no more.

This arrangement is self-working and convenient. Every hoisting-shaft should be provided with one of these automatic Brake Operators, as they are cheap and efficient, and any man with ordinary skill can apply it.

A Munificent Donation to the Cause of Science.

The members of the California Academy of Sciences were pleasantly surprised at the last meeting by being made the recipients of a deed for a piece of land for building purposes, which is valued at about \$150,000. The donor is Mr. James Lick, who recently made the California Pioneers a similar gift. The lot given to the Academy fronts 80 feet on Market street, and is 275 feet deep on one side and 195 on the other. It begins on the southeasterly line of Market street, 195 feet southwest from the southwest corner of Market and Fourth streets, and runs thence eastwardly and parallel with Fourth street 195 feet; thence southwest at

THE \$2,000,000 DIAMOND.

an angle of 45 degrees to a point 275 feet from the southwest line of Market street, which last mentioned point constitutes the southwest corner of the 100-vara lot; thence northwest and parallel with Fourth street 275 feet to the southeasterly line of Market street; thence northeast and along the line of Market street to the point of commencement. This constitutes 100-vara lot, number 126, of the city of San Francisco.

Mr. Lick states that he makes this gift to the Academy of Sciences in consideration of the desire he has to promote the diffusion of science and the prosperity and perpetuity of the Academy. The conditions under which the land presented is to be accepted are somewhat strict, taking into consideration the chronic impecuniosity of scientific associations, and the California Academy in particular. The premises must be used and devoted exclusively for scientific purposes and none other, nor shall they ever be encumbered in any manner. They must not be sold during the life time of any existing members of the association, nor must any part of the building be leased or rented for any purpose foreign to the institution. They must erect and forever maintain on the premises an edifice that shall cover nearly all the premises except enough to afford light and ventilation. The building must, in the terms of the deed, cover a space of 80 by 225 feet, be three stories in height, built of brick with granite front, faced with appropriate scientific emblem, with a classic design such as will readily distinguish it from buildings need for business or commercial purposes. The necessary funds to commence and complete this structure must be secured within two years from the date of the deed, and it must be finished with reasonable dispatch. Three rooms only are specified, one for a library, another for a museum, and

another to be suitably constructed for a hall for lectures.

Notwithstanding the restrictions laid down by the donor, the academy think they can raise the necessary funds to comply with its obligations within the stated time, and therefore accept the present. As such a building as the one described will not cost less than \$100,000, some other of San Francisco's wealthy citizens must also aid the cause of science by contributing the means to erect it. The members of this association have been struggling along for twenty years in a set of dingy apartments, while their more fortunate brethren in the Eastern States and Europe have had fine build-

AUTOMATIC BRAKE OPERATOR.

ings, abundance of means and everything necessary for collecting a museum and displaying it to advantage. This is the first instance on this coast where a donation of any kind whatever has been made to the cause of science, and the first present the Academy ever received, with the exception of cabinet donations. Should the moneyed men of San Francisco aid the scientific men, the purposes of the gift will be carried out, and we trust that they will not let it go by default when the two years are up for want of means. Let a few of our California street millionaires reserve some of their large profits from mining operations and donate them to the Academy. It is doing much good in the community, and achieving practical results. Mining in particular owes much to science, as in fact does every department of human industry. It investigates and elucidates principles which eventually lead to beneficial results to the public in general, and by its observations of detail furnishes facts which the inventor or mechanic apply to the concerns of every day life.

Mr. Lick deserves the hearty thanks not only of our own community, but those of the workers in the cause of science all over the

world, since he stands alone among the many rich men of our Golden State, as the only one who has opened his purse spontaneously and given any aid to the cause of science. The location of the property is in a growing part of the city and on a street where it is probably as valuable per front foot as any in town. It only remains now for the wealthy men to assist in erecting a building which will be not only an ornament to our city, but a monument to perpetuate their names as its founders.

A Valuable Diamond.

The accompanying cut is a representation of the exact natural size of a large diamond found at Waldek's Plant, Vaal river, South Africa, November 6th, 1872, by Robert Spaulding's party. An old citizen of this place has written to General A. M. Winn, of this city, and enclosed a photograph of this gem, which we have copied. It is irregular in shape, and about an inch and one-eighth in diameter. The diamond is one of the first water, and weighs 288 1/4 carats. Its value is said to be fully \$2,000,000. It may be mentioned for the benefit of excitable readers that such "finds" as this do not occur every day, nor every month, and even if they did, the gem would materially decrease in value. It is hardly probable that Mr. Arnold, of "diamond field" fame will purchase this one, although he might have told the man to "throw it in with the others" if it had been in the store where he procured his miscellaneous "calt" for the Arizona Fields. Some of our mining friends can, however, by seeing a cut of this precious stone, realize what "might have been" had the bogue fields only proven genuine.

AN INVENTION WANTED.—Some sort of an appliance is sadly wanted by means of which a telegraphic operator can communicate with, or signal a train at any place on the route. If an invention filling this requirement were made it would be of great benefit to the public as well as to the inventor. If it had been possible to signal the train as it passed along the road beside the telegraph wires, the recent accident on the Central Pacific railroad would have been avoided, since the fact of two trains being on the track, and running towards each other, was known at Elko before the collision occurred.

Cannot some of our ingenious inventors set their brains at work and overcome this difficulty. Electricity has almost been made to speak and has been turned to so many uses that it is highly probable some system might be devised whereby an electric signal would warn an engineer to slow up his train to avoid impending danger. Whatever the system it must be made to operate cheaply and be constructed in such a manner that a train may be signalled at any point on the line of road. Let us hear from some one on the subject.

ENGLISH AND AMERICAN COAL MINES.—English coal veins are usually from 2 ft. 4 in. to 2 ft. 10 in. thick, while the American bituminous coal veins are usually from 4 to 8 ft. thick, and the anthracite veins from 20 to even 50 ft. thick. This great disparity in the thickness of the veins is the reason why coal cutting machinery has never been introduced into the American mines. There is little economy in employing cutting machinery in a six-foot vein, while it greatly adds to the economical working of a 2 or 2 1/4 ft. vein.

THE WINNEMUCCA mine in Bingham Cañon, Utah, netted its owners over \$600,000 during the past year.

CORRESPONDENCE.

Placer Mines Near Forrest City.

[Written for the MINING AND SCIENTIFIC PRESS.]

Pioneer Days and Operations.

Forrest City has experienced its full share of the vicissitudes common to most early mining camps in California. The ravines in the neighborhood, enriched by the Blue Lead, which crosses the country here, paid when first worked most liberal wages. With the partial exhaustion of these deposits the more exposed and easily reached portions of the main lead were attacked through drifts and shafts, and for a number of years some twenty or thirty companies, employing several hundred men, did well at this business. Meantime, a good many tunnels were started for those sections of the old river channel that were more deeply buried or supposed to lie further back. Then came

The Era of Stampedes.

When the California miners, eager to exchange these impoverished diggings for virgin placers, and ignorant of the buried wealth they were really abandoning, hurried off to distant fields of labor, leaving their claims and often also the costly improvements made upon them; most of which afterwards fell into a state of irreparable decay. Neglected so long the tunnels caved in or swelled shut and the shafts were filled up; and when these men came back, as many of them did, it was to find their grounds very often in the possession of others, and the works that had cost them so many hard days' labor well-nigh useless.

During this period of absenteeism two or three companies kept work going on their claims, the principal of these being

The Live Yankee.

Who owned a tract having a frontage of 360 by a depth of 2,600 feet on the Blue Lead south of the town. This was opened by a long and costly tunnel, commenced now nearly 20 years ago, and which was afterwards maintained in a state of repair at considerable expense. From '54 to '63 inclusive, this company took out \$713,777, of which nearly one-half was paid out in dividends. After this the net earnings fell off materially, the dividends amounting to only about \$10,000 per year. The richer portion of the gravel being washed out nothing has for some time past been done on this claim; though it is possible it may yet be worked by hydraulics or portions of it be reopened for drifting purposes.

The Highland and Masonic Claim.

Another of those that were worked for a long time without intermission, lies near the town, and has had a very chequered history. It was first opened by means of a shaft and supplied with costly hoisting and pumping works, which were afterwards burnt. The yield was large but owing to the original outlay and heavy current expenses, not much profit accrued, and the claim was finally sold for debt. It was afterwards opened by a long bed-rock tunnel and for a time turned out as much as \$100,000 per month, after which it again fell off and finally dwindled away to almost nothing. The water in this claim, notwithstanding the quantity is considerable, is so acidulous that sheets of zinc exposed to its action are soon eaten up entirely, and shovels left in it for a short time are so eroded as to be unfit for further use.

The North Fork

Is another of these old companies, that with some intervals, have kept work in progress about Forrest City. They own a very extensive and valuable section of the Blue Lead adjoining the Bald Mountain ground on the northwest, and which they are now opening with a bed-rock tunnel, already in over 2,000 feet, with about 1,000 more to run before reaching the channel. They have been at work on this tunnel several years, and it will probably require another year to complete it, much better progress being made now since the single hand drill and giant powder were introduced.

The only largely productive claim, however, in the immediate vicinity of Forrest City, and that which now imports more life and business to the place than any other, is that of

The Bald Mountain Company.

Situate close to and a little north of the town. The members of this Company, 20 in number, are mostly working miners, who deserve great credit for the industry and perseverance as well as the good judgment shown in opening their ground, which covers a broad space on the main blue lead. The tunnel nearly 2,400 feet long is a well constructed and costly work, the most of it performed by their own labor. They are meeting with a merited success, which, besides enriching themselves, is likely to prove of great benefit in encouraging other parties owning grounds here to go ahead and open them up. This plan of practical miners uniting their claims, or securing enough of others to make up a good extent of ground, and then associating their labor for driving a tunnel, is one that

should be more generally adopted, now that this business is attended with so much less hazard and requires so much less time and money than formerly.

The experience of this Company is of value also in showing that parties going after these old channels should not be discouraged, even if the first gravel reached fails to come up to their hopes, or if they meet with other disheartening circumstances in the exploitation of deposits so unique in themselves and marked often by great eccentricities. When 500 feet in, some auriferous gravel was found on top of the bed-rock, but it was of very low grade. A thousand feet in, another streak was encountered of somewhat better character, but, still not rich enough to warrant removal. At 1,300 feet a shaft was raised 12 feet above the tunnel when a three-foot stratum of gravel, blue and compact, was broken into, which on being prospected, paid at the rate of \$3.19 per car-load. To most men this would have been entirely satisfactory; but it was not exactly the material our young friends were after—did not quite come up to the standard of the genuine Blue Lead gravel about Forrest City, so they pushed ahead another hundred feet, when, raising up again, they broke into a thin layer of dark blue gravel, exceedingly hard and well stocked with gold, showing that they were in the rich pay streak of the main lead.

Obstacles and Discouragements.

For the first 250 feet in, the tunnel of this company was run on a low grade. At this point the bed-rock was encountered, indicating the necessity of a raise; 500 feet in, the grade was made still steeper—1 foot in 12, which was maintained for some distance. The bed-rock, composed here partly of serpentine but mostly of talcose slate, rises and falls at certain places in a manner to greatly perplex the miner, tempting him sometimes to raise his tunnel only to find, after proceeding a short distance, that he has been betrayed into a mistake.

Finding the inner extremity of their main tunnel too high, this Company have obviated this trouble by two branches, the one starting out to the left 1,200 feet in, and the other to the right 1,400 feet in, and which, after making a slight elbow turn and run nearly parallel with the main tunnel, but on a lower level. Through these side tunnels the gravel is now brought out; 1,800 feet in, a turn-out, 100 feet in length has been constructed, where the cars pass each other.

The Stratum of Pay Gravel Here

Varies from 2 to 4 feet in thickness; but the most of it is so very hard that only about one foot, and often not more than 6 inches of the richest portion is removed; and in breaking out this, the gad, and sometimes also blasting, has to be employed. After removal, much of it has to be crushed with a sledge hammer before the gold can be extracted from it by washing. Scarcely more than two-thirds of the gold-bearing gravel is taken out, the balance being left with a view to its being hereafter extracted and crushed with stamps. Although the Company have over a mile of sluices set along Oregon Creek much gold is necessarily left in the tailings, which will also at some future time be worked over. To make room for the drifters, the top of the bed-rock, here much decomposed, is removed for two or three feet. Though so friable it carries no gold to a greater depth than two or three inches, nor is any found in the crevices and pot-holes, the latter being filled with bits of wood, leaves and sand.

Modes of Working, Yield, Value, Etc.

Although several hundred feet of fine gravel had before been penetrated, no main gangways were run until 1,800 feet in from the mouth of the tunnel. They are 300 feet apart, the sub-gangways being 65; the latter, where the gravel is extremely hard, being sometimes wider, as it is found cheaper to shovel the dirt a greater distance than to cut numerous gangways.

A great economy has been effected here in substituting giant powder, and the single hand-drill for the old style of explosive and mode of drilling; the men, all of them old California miners, preferring the former, as they allege, on the score of both health and comfort.

It was only during the past summer that the Bald Mountain Company got their dump-yard, sluices and other outside works in shape, and commenced running out gravel. They have since extracted some 20,000 car-loads, which will average very nearly \$10 each—their estimate being half an ounce to the car-load, and this gold being worth \$18.30 per ounce. It is mostly coarse and easily saved when once freed from its containing cement and gravel.

Prior to December last, 45 men were employed in this mine. At that time the dump yard being full, without water for washing, the number was reduced to 30. Now, that there will be no further trouble about the water supply, the force will be increased as speedily as possible, it being the intention of the company to employ 100 hands as fast as suitable men offer, they having a preference for whites and old Californians. They pay \$3 per day in gold—board and lodging at the hotels in the town \$7 per week. This company have ground sufficient to last them for a great many years, indeed so long that this feature is not much consulted in estimating the value of their mine.

To Mr. H. Wallis, Superintendent, and to Messrs. Clough, McGregor and Gilson, the latter, Secretary, and all members of the company, I am indebted for the foregoing information, and also for the courtesy of being shown through the underground works of this interesting, valuable and well conducted property.

H. D.

Forrest City, Sierra county, Feb 3d, 1873.

California at the Vienna Exposition.

EDITORS PACIFIC RURAL PRESS:—The question is now being agitated both in the Eastern States and in California, what shall we send to the Vienna exhibition? In the East they have many sources to draw from to make a great exhibition; but here our resources are but limited. We cannot show what would be our greatest pride to show, the great productiveness of our soil, or the beauty of our climate. Our fruits and vegetables cannot go there only in a preserved state, and would lose much of their good effects. But I would like to suggest that if it is a possible thing that we send a section of our big trees, say a cross section sawed from some of the largest trees to be found with the bark on, and from twelve to eighteen inches thick; it would probably be a difficult job to get, and would cost much money, but I think there would be plenty to take the job if well paid.

Only imagine a wheel cut from the end of a tree thirty-three or thirty-four feet in diameter. Would all the other products of the State we could exhibit there, create half the wonder and astonishment that would. That would bring facts to them that they could not deny. The wonderful size of California fruits, vegetables and other productions have been beralded to all parts of Europe, but by most people they are looked upon as California yarns and passed over without thought, but those that hear it from parties they fully credit and believe, do not realize their immense size.

Suppose we take thirty feet in length and saw out a plank, you could cut and cover the whole gable end of a two story house thirty feet wide, with a base four feet, first story twelve feet high, second story ten feet and the gable seven; the width of the plank would reach to the ridge of the house; by comparison with some familiar object like the house, one will realize the size better than by telling the number of feet.

The good from such an exhibition would not end with the exhibition at Vienna, but could be then exhibited through all the large cities of Europe, and if desirable could even be made to pay all expenses in a short time. If you think the thing practicable you can use this as a starter.

PIONEER.

Sacramento, Feb. 1873.

STILL ANOTHER SAFETY CAGE.—A new safety cage is to be seen at the Belcher works, Gold Hill, in which is displayed some very fine work in the way of iron forging. The builder, William Bray, proposes to show his confidence in the safety arrangement by standing on the cage and allowing the cable by which it is suspended to be cut, when he will either fall about three inches or go clean to the bottom of the shaft. By many it is pronounced the best safety cage yet introduced, and it may be that it is; but we are of the opinion that it would be better with wrought iron or steel eccentric clutches than with the present ones of cast iron. However, we are not to stand on the cage when the rope is cut, so we will withdraw our one objection. We once saw Captain Sam Curtis, now Superintendent of the Virginia Consolidated, and another man, whose name we do not now remember, stand on a safety cage at the old Savage works and allow the cable to be cut above their heads, with about a thousand of open shaft under their feet. They fell about an inch, which was no further than our hair raised, and not as far as two inches as that on the heads of the men on the cage, was elevated. That fall of one inch must have seemed at least 100 feet to them. We want to see no more such experiments—once is a dose for all time.—*Virginia Enterprise*.

PROF. SHEAFER lately delivered an address before the Scientific Department of Lafayette College upon coal, reviewing its importance as a fuel, and the effect it will have upon the strength and power of nations. He said: "Practical as well as analytical tests fail to supply an acceptable substitute for coal. England must soon yield to America in the great competitions of the nations. The strength of both is in their coal mines, and in England these have already reached nearly or quite their maximum while our anthracite is but partially developed, and our bituminous coals are scarcely touched.

"But though Pennsylvania's store of anthracite will last for many years, and long after it is drawn upon to supply England, it is useless to deny that there is a limit to the supply, and that after a time it will be exhausted. Then what shall we do?"

"We shall proceed to open the grand reservoir, the bituminous coal fields, compared to which our anthracite beds are but as a mill-pond to the Gulf of Mexico. With a bituminous area of 12,000 square miles in Pennsylvania, and 197,000 in the United States, we can supply the world with fuel for ages to come."

PROPORTION OF LOCOMOTIVES TO RAILS.—Prof. Rankin says the weight of rails per yard in length should equal fifteen times the greatest load on the locomotive drivers in tons. Perdonet, in France, takes twelve instead of fifteen. The Philadelphia and Reading railroad, on rails made with great care by the company, prefers not to exceed 4 tons on a 64 lb. rail.

Seam Mining.

However it may be with some other residents of El Dorado county, the writer of these lines was, until quite recently, totally ignorant of the character and method of what is called seam mining, which is an important, increasing, and, so far as we are informed, a distinctive industry of the northern portion of this county. The most extensive, systematic and successful operations in this line have been in the Nagler and Peterson claim at Greenwood, the Whitesides claim and the Blasdel (formerly the Hart) claim near Georgetown. The Nagler claim has paid enormously and is reported to be now better than heretofore, but we have no exact or approximate information of the gross yield or net profits. The Whitesides claim is credited with a gross yield of \$30,000 last year, of which it is presumed that \$22,000 to \$25,000 was profit. The Blasdel claim has not been as thoroughly opened nor worked as long as either of the above named, but it is yielding at the rate of \$700 to \$800, at an expenditure not exceeding \$150 to \$200 per month. Through the courtesy and under the escort of Capt. E. W. Blasdel we were shown through the latter mine, and as a result of personal observation and of the information which his intelligence and practical experience enabled him to confer, we obtained a tolerable idea of this novelty in mineral development and mining. No two of these seam mines are alike, except in general characteristics, but a description of one will give some sort of an idea of the others. In all there are seams of decomposed or rotten quartz, imbedded in slate of similar consistency, and in all there are indications of violent upheaval. In the Blasdel claim there are several seams—perhaps a dozen or more—which, with the soft slate in which they are embedded, fill, at the surface, a space of sixty or seventy-five feet from east to west narrowing and coming together as they descend, enclosed by walls of harder slate. The course of the quartz seams and their slate casings is northeast and southwest. The position of the quartz seams and soft slate ledges varies from an almost vertical to an angle of twelve or fifteen degrees. The novelty of the mining consists in the fact that gold bearing quartz and slate casings are furnished, of such consistency that they can be readily quarried, pulverized and separated from their precious contents by hydraulic power and process. With a good "face" on a ledge, sectionally presented, more ground can be moved with the same amount of water and pressure than in the average of gravel hydraulic claims. It is but seldom, and then generally owing to the position of the strata, that powder has to be used to loosen a bank. In the Blasdel claim an opening two hundred and fifty feet long, and sixty feet deep and from fifteen to twenty-five feet wide has been made in a little over one season's washing. This claim is owned by Captain Blasdel, his brother the ex-Governor of Nevada and a Mr. Phillips of San José. They own a ditch which is about four miles long, with some other smaller ditches that catch waste water, and from these they lead the water through seventeen hundred feet of nine inch iron pipe to their claim. At a depth of about seventy feet all but two of the quartz seams in this claim have come together, and in a shaft sunk about thirty feet below the bottom of their cut they have decomposed quartz nearly ten feet in thickness, of the consistency of a tolerably compact sand bank, and this has yielded on assaying tests at the rate of \$18.75 and \$19.25 per ton. A tunnel three hundred feet in length will penetrate to the line one hundred and five feet below the bottom of the shaft, which project Governor Blasdel is contemplating, and when it is accomplished there seems every reason to believe that the net yield will be enormous. So mote it be!—*Placerville Democrat*.

A VALUABLE INVENTION.—Among the many labor-saving appliances for working mines, there is none more worthy of attention than the Dexter-Windlass. This machine, the invention of Mr. John A. Nelson, of Salt Lake Iron Works, has been tested by the most experienced miners of the Territory, and has given complete satisfaction. The windlass will hoist 500 lbs. from a perpendicular shaft at the rate of one foot per second, with the power of one man, and, when worked by two men, will raise from an incline one ton in the same time. The huckets and cars are lowered by a friction-brake, which ensures entire safety in its operation. The machines are now being manufactured at the Salt Lake Iron Works, in models to suit the sizes of shafts, and are made of the best materials and of superior finish. Mr. Nelson, the inventor, is foreman of the Iron Works machine shop, and has one of these windlasses in working order at their foundry.—*Utah Mining Journal*.

THE Philadelphia Ledger takes up the money side of the horse disease. There are about 9,000,000 horses in the United States, valued at \$666,000,000. If but one per cent. of these should be carried off, making 90,000 horses, it would entail a direct money loss of \$6,600,000; two per cent., or two deaths out of every hundred, would bring a loss of over \$13,000,000; and three per cent., which is the mortality in some cities, swells the loss to nearly \$20,000,000. This is in addition to the heavy loss of the daily earnings of the vast proportion of the horse that are disabled and cannot work.

MECHANICAL PROGRESS.

A New Process for Manufacturing Steel.

Some time ago we became cognizant of some experiments that were in progress aiming at the cheap and rapid production of steel from iron without the necessity of melting the iron. As this process has been perfected and a patent granted for it, we are now at liberty to give our information in regard to it, and we are free to say if the same results can be obtained on a large scale that we know, from actual sight, have been on a small scale the invention is not second to that of Bessemer.

The invention in brief consists of a process by which iron, by immersion in a molten bath for the space of from 15 minutes to one hour, becomes converted into steel.

In detail the process is as follows: By means of a magnetic coil or helix around a blast furnace or cupola, where Missouri ore (Iron Mountain, Shephard Mountain, or Pilot Knob) is smelted with coke, a dark product with slightly magnetic properties is obtained. This is spongy, light as to weight, and in melting boils up like molasses. This, when smelted in a crucible or open hearth, imparts to bar iron, heated or immersed therein, new pure iron, that permeates its structure, making it more dense, ductile and malleable.

A small per cent. of this dark product, when used in a common blacksmith's fire with coal, intensifies the heat—at the same time it acts as a flux upon the iron or steel that precludes its burning at a welding heat, so that Bessemer or other steels may be successfully welded without sand, clay, or borax—heated to semi-fluid therein. When Iron Mountain ore is melted in certain per cent. with pig or scrap metal, a dense, bright, clear sounding product (very hard) is obtained. A small per cent. of this melted with the dark product, adding a little lime and oxide of iron, forms a bath of solution that imparts to bar iron immersed or hoiled therein very fine steel properties. Such products work into the very finest cutlery, including plane bits and chisels, that will stand the hardest pine or oak knots. This product shows no steel properties until it is heated bright red and cooled off in water, when it assumes all the properties of fine steel. It may be successfully worked at a white heat without injury, or even welded in a blacksmith's fire without borax or any other protection from the air. A furnace is now being constructed in the West for the production of these new and valuable products of iron, with a view of bringing the matter practically before the iron and steel interests of this country. Missouri ore is named for the reason that any others have not been tried. We have specimens of these products in our office, and will be pleased to show them to parties who may call.—*American Manufacturer.*

WHAT IS STEEL?—Mr. A. L. Holly in his lecture before the Stevens Institute, says: "Before considering the process and machinery, let us define the term steel. Steel is an alloy of iron which is cast while in a fluid state into a malleable ingot. Any radical nomenclature founded on chemical differences leads to endless mistake and confusion. If steel is defined as an alloy of iron containing carbon enough to harden it when it is heated and plunged into water, then puddled iron, although laminated and heterogeneous in structure, may be steel, and the finest product of the crucible, although crystalline and homogeneous in structure, may not be steel. The fundamental and essential difference between steel and all other compounds of iron, is a structural difference, and it is always easily determined, while steel and wrought iron cannot always be distinguished by chemical analysis. The same proportions of carbon, manganese, silicon, and other elements, may exist in and similarly affect any malleable alloy of iron. Steel is, therefore, an alloy of iron which it casts into a malleable mass."

A PLATINUM COINAGE.—The idea of a platinum coinage continues to be a subject of discussion among the scientists of Europe. No other metal, not even gold or silver, possesses so many inherent qualities for such use. It would be proof against forgery on account of its high specific gravity; its scarcity gives it an intrinsic value, and its indestructible nature admirably fits it for enduring the wear of constant use. It has already been largely used for medals in France, and successful experiments have been made for converting it into coin. In Ruesia, it was actually used for coin previous to 1845, when it was demonetized by imperial ukase. That step was taken at the time because the ready methods of working and refining the metal were not well understood. That objection is now, however, fully removed.

ANOTHER MONSTER GUN.—It is stated that the authorities of the Royal Gun Factories, Woolwich, England, have designed and are prepared to construct a 70 ton gun, which shall throw a projectile of 1,400 pounds.

NEW CAR-WHEEL LUBRICATOR.—A gentleman in Pottsville, Pa., has received letters patent for a self-lubricating car-wheel, axle and trucks, which when properly adjusted, is said to lubricate without renewal for six to nine months.

Cleaning and Refacing Stone.

Mr. Ira Wadleigh, of Charlestown, Mass., has patented a mode of cleaning the faces of cut and other stone, which is described as follows:

For this purpose of cleaning granite, he takes about one pound of commercial oxalic acid to twelve quarts of cold water, and, by stirring, dissolves it thoroughly. He sometimes uses but three-quarters or one-half the quantity named of oxalic acid and sometimes puts the dry powder on the dampened stone, and adds water—this where there is any unusually tenuous spot. This will clean granite and marble; but for marble he prefers to use one-half pound of commercial chloride of lime dissolved in twelve quarts of water cold. Sometimes, on marble he alternates the application of chloride and oxalic acid. He rubs on both or either of these to the article treated, alternating with the rubbing on of cold water. For granite he also uses one pint commercial sulphuric acid mixed with twelve quarts cold water. This for the first application, letting this stay on the stone treated for three to five minutes. He then removes it by washing this object with cold water; then rubs on with a brush the solution of oxalic acid described, letting it stay three to five minutes, and washing off with cold water. This treatment is continued until the stone is clean.

Oxalates have been used in cleaning stone; but the proportions and manner of applying it heretofore have been quite different. It is necessary that the strength of the acid and the method of applying should be governed by the character, and condition of the stone to be cleaned.

A TRIUMPH OF MODERN ENGINEERING.—The great suspension bridge—built over the Niagara river at a height of nearly two hundred and sixty feet above the water, and supported by towers upon each bank, the centres of which are eight hundred feet apart—has proved one of the most satisfactory successes in modern engineering science. The question of its safety having a short time ago been agitated, a critical investigation of its actual condition was accordingly made by a company of engineers, and the effect of twenty years' wear and exposure has been accurately determined.

In the examination thus made, the caps on the towers covering the cables were removed, and the cables found to be as perfect in all respects as ever they were. But most interesting and important of all was the result which attended a thorough inspection of the anchorage of the cables. The masonry over one of them was removed for about twelve feet, or below where the wires are attached to the anchor chains. A portion of the cable is imbedded in water lime cement. For twenty years this has been so, yet on removing it and rubbing the point off the wires, the latter were found as bright and perfect as when placed there, the cement having preserved the wire and anchor chains intact.

IMPROVED CAR AXLES.—To prevent flaws in railway axles, a method of shaping them by rolling pressure, instead of hammering, has been devised by an engineer, the result being accomplished in two minutes instead of half an hour, as required by the ordinary plan—the axle being not only superior in quality but more uniform in size, and is produced more cheaply. The machine used for this purpose consists of three rollers, regulated so as gradually to press more closely together, thus reducing the bar, and extending its length to the required size. It is claimed that the benefit of this rolling process is to obviate flaws in axles which so frequently cause disasters on railways.

STEEL AND MAGNETISM.—From recent experiments made by Captain Treve at the Brest Foundry, France, it will appear that the effect of magnetism is to cause a condensation of the metal in casting steel, the grain becoming finer and closer. This mould, in which the steel was cast, was a large coil of stout wire through which the electric current from a dozen Bunsen couples was passed, during the whole period of cooling. But steel thus magnetised is found to be weaker than ordinary steel against tensile and crushing strains; and it is therefore suggested that means should be taken to protect caststeel from terrestrial magnetism, during cooling.

HOMOGENEOUS STEEL.—One of Seimen's furnaces for the manufacture of homogeneous steel has recently been put up by Singer, Nimick & Co., of Pittsburg, Pa. This is a bold innovation on the old way of making steel, but after a severe test it is found to be a grand success. About 6½ tons is the usual average of a single melt, and its capacity can be doubled at once, if needed. This steel is used almost exclusively in the manufacture of boiler plates, and every plate is tested before it leaves the works.

A SUBSTITUTE FOR BORAX.—M. Gauduin has been making experiments to supersede borax, which is generally employed in soldering, and the result is that he finds that an excellent flux for soldering iron, and brazing copper and aluminium hrouze, is obtained by a mixture of equal parts of cryolite and chloride of barium.

A NEW PROCESS FOR MAKING IRON AND STEEL is announced, the chief point of which is the forcing a jet of hot air against the molten metal as it runs in drops through a part of the furnace. The supply of air is regulated in accordance with the amount of oxidation required. To form steel, vapor of hydro-carbons is added.

SCIENTIFIC PROGRESS.

Living, a Science.

The mineral matter necessary for the nutriment of plants has been most carefully studied, and the amount and quality of the mineral ingredients absolutely indispensable to their well-being has been determined. Hence, agriculture is becoming more and more an exact science, and the soil like a machine, to which we can present raw material, confident of the yield and of its quality.

Such being the case, the question naturally arises in some minds, why cannot such mineral matter as is necessary for the maintenance of the human frame be supplied to it in a concentrated form? And may we not, by altering the proportions, so manage the composition of this mineral mixture, as to supply to the system of each, that which it lacks? Acting on this idea, a recent writer proposes a mixture, or "Zootropic powder," which is compounded as follows:

Calcic Hypophosphite.....	10.
Trisilicic Calcic Phosphate.....	10.
Sodic Phosphate.....	15.
Calcic Carbonate.....	20.
Magnesian Hypophosphite.....	15.
Sodium Chloride.....	10.
Potassic Bicarbonate.....	15.
Ferric Oxide.....	30.
Manganic Oxide.....	2.5
Potassic Silicate.....	2.5
	100.00

In making up the proportions for this powder, the author was obliged to determine the proportions of mineral matter in the human frame, when in sound health, only approximately. The inventor has tried the powder upon himself and his sons, but does not state whether the effects were such as he anticipated.

Theoretically and experimentally, plants may be made to live and produce by the aid of concentrated manures alone; as in clean sand or pounded glass, supplied only with such mineral manures and artificial solvents, as the various kinds of plants may require. But such are only hot-house experiments. If the same plants, under similar manurial conditions, were subjected to field culture, and all the varied accidents of climate, insects, fungi attacks, etc., the system would be found utterly impracticable. In order to secure that degree of health in plants that will enable them to successfully resist the casualties of broad culture, some bulky carrier must be employed in which to convey, at least, a part of their food. We find that it is absolutely necessary to mix stable manure, muck or something of that kind with their mineral food.

So with the human frame. It might, no doubt be kept together, and life sustained, by purely mineral food; but, as in the case of plants above noted, our bodies would lack elasticity and power of endurance. We should have no power to sustain ourselves in the stir and war of life. The assimilation of food would not keep up with the amount of force expended in exercise. There is an evident demand for bulk—waste—in the stomach. An opportunity must be given for the organs designed to carry off this waste to do their proper work. Without use they become unhealthy and spread disease all through the system. Nature in her wilds, provides an abundance of decaying matter to accompany the mineral food necessary for vegetable life. The Creator has so constructed the human system that bulk in food is one of the essentials for the human stomach.

When the earth is forced to yield beyond its natural powers of production, added stimulus, in the way of concentrated manures must be administered; just as such stimulus must be provided to enable the human system to bear up under unnatural effort, either physically or mentally. We may modify, but cannot utterly defy the laws of nature. Hence the true science of living is to keep as close to the dictates of nature as our artificial modes of life will admit.

FROST CRYSTALS.—The crystalline form, which the vapors of a room assume, while being condensed on the cold panes of a window depend mostly on the surface condition of the glass. A glass plate, absolutely clean and flat, would show no forms, the frost being equally distributed. The wiping or cleaning of the window inside the room is usually done in a roundish, spiral, or scroll like manner; hence the first adhesion of vapor, and the subsequent crystallization (if we can call it so) follows these lines and produces the well known fern-like or leaf-like forms. But wipe one pane before a frost carefully by horizontal streaks only, and the next to it by vertical streaks; and the frost crystals will be formed in the same directions respectively, much more resembling those of some chemical salts than vegetable shapes. Snow crystals forming in the air without any chemical or mechanical obstacles, are always hexagonal, with secondary formations of the same system.

VOLATILITY OF IRON.—Iron is volatile at very high temperatures, the same as gold and platinum. Dr. Elsner, Director of the Berlin porcelain factory, enclosed a small piece of wrought iron in an unglazed crucible and exposed it for several hours to a temperature of at least 3000° C. On removing the cover of the crucible, small needles of metallic iron were easily discerned, clearly showing that iron can be volatilized at high temperatures,

A New Method of Consuming Coal Smoke.

Mr. B. T. McCarty, of Cleveland, Ohio, has invented a new method of consuming coal smoke, which promises to admit of useful application. He was looking after means to secure a better draft for a sluggish fire, and an idea occurred to him, after other devices failed, to try the effects of steam. A small pipe was made to conduct the "dry steam" from the top of the boiler to the upper part of the furnace, where it entered in two small jets, striking downward on the burning fuel. No sooner was the steam injected into the furnace than the sluggish, smoky fire sprang up into a clear, bright yellowish and intensely hot flame, filling the whole furnace with a loud roar. The end sought—a strong draft—was attained, and, in addition, the long sought desideratum of a smokeless fire. This simple apparatus was next applied to the furnace of the Cleveland Herald printing establishment, and that journal gives an interesting account of the result. It says: "This smoke stack that had long been a nuisance to ourselves and our neighbors, was instantly as innocent of smoke as a deserted house, and so it has continued, save when the steam has been turned off for the sake of experiment and comparison." The proprietors of the Herald claim a saving of 25 per cent. in fuel when steam is admitted to this furnace.

A Novelty in Telegraphing.

Prof. Loomis, of Yale College has proposed something novel in the way of telegraphing. His plan is to telegraph from any given high peak to another at long distance, using an upper stratum of air as a means of electric communication instead of the ordinary wires. The plan as we understand it, is to erect upon such heights a tall tower or mast, the tops of which will be connected with an apparatus capable of generating a large amount of electricity which will be carried from point to point along this upper stratum of air. Ground connections will be used to complete the circuit as with wires. It is supposed that the slightest pulsation of the electricity of one tower will produce a similar pulsation at the other.

A bill is reported as having passed both Houses of Congress, giving some special privileges to a company organized to carry out this scheme, the object of which is described to be the development of the untutilized principles and powers of natural electricity, to be used in telegraphy, generating light, heat and motive power, and otherwise operating machinery run by electricity for any purpose. The name of Prof. Loomis as its originator is the only thing at first sight that attaches any importance to the scheme.

LIGHT.—According to the theory generally received at present, the whole universe is an immeasurable sea of highly attenuated matter, imperceptible to the senses, in which the heavenly bodies move with scarcely any impediment. This fluid, which is called ether, fills the whole of space—fills the intervals between the heavenly bodies, as well as the pores or interstices between the atoms of a substance. The smallest particles of this subtle matter are in constant vibratory motion; when this motion is communicated to the retina of the eye, it produces, if the impression upon the nerves be sufficiently strong, a sensation which we call light. Every substance, therefore, which sets the ether in powerful vibration, is luminous; strong vibrations are perceived as intense light and weak vibrations as faint light, but both of them proceed from the luminous object at the extraordinary speed of 186,000 miles in a second, and they necessarily diminish in strength and proportion as they spread themselves over a greater space. Light is not, therefore a separate substance.

OCCLUDED HYDROGEN NOT ALLOYED.—It has been a question whether hydrogen when absorbed or occluded by palladium does not enter into a true union with the metal so as to form an alloy. Recent experiments in England appear to show that no alloy is formed, neither can the union be considered as a mixture of a definite palladium hydride, with excess of palladium. The experimenters, Messrs. W. C. Roberts and C. K. A. Wright, are therefore inclined to believe that in palladium charged with hydrogen, each separate charge must be regarded as giving rise to a distinct compound, which cannot be expressed by simple formula.

A BEAUTIFUL FUNGUS.—A correspondent of the *Scientific American* recently sent that journal a stereoscopic view of a fungus, found growing upon an old anvil block in an unused blacksmith shop. It was of a pure white color, and about nine inches in extreme length, seven wide, and five high. The finder considering it a thing of beauty and of a perishable nature, concluded to have a photograph made of it. It had more the appearance of a piece of marble sculpture than of vegetable origin, and was much admired by all who saw it. It was pronounced Hydnum coralloides, one of the most beautiful of hymenomycetous fungi.

IMPROVEMENT IN PHOTOGRAPHY.—Some genius is reported to have discovered a process of introducing red rays through the front part of a camera, which is said to improve the half tints of photographs, and diminish the time of taking impressions nearly one-third.

[S. F. Stock and Exchange Board.]

The Stock Market this week has been pretty good considering the weather and the late depression. Still no very large amount of business is being done, nor are prices so high as to render people unable to buy if they want to. The variations in price do not amount to much for no general rise has occurred, or has any particular mine been in much better luck than its neighbors. The Washoe mines are attracting considerable attention. Belcher particular is in favor. During last month it milled 8,501 tons of ore, averaging \$51.46 per ton, or \$437,489. The Crown Point mine in January milled 16,000 tons, worth \$41.43 per ton or \$621,450. It is probable that the former will yield \$100,000 more this month. It is milling a quantity now equal to 9,000 tons per month, worth about \$60 per ton. The *Alta* makes the following remarks concerning the state of the market:

There is now a growing strength in the market, per-
hapse better founded than last year, since there are so
eral mines, both in Virginia and Gold Hill. It is
reported to have good bodies of ore about to be developed,
and in the hands of strong parties disposed to keep the
control, and preparations for a vigorous campaign have
been made. It is confidently stated sometimes
since that a large body had been discovered by
and Norcross and Chollar line, at some distance from the
shaft-working levels of the Chollar. That mine, after
seven years of ore production, has levied an assessment,
and has been sold to the Government. It is also men-
tioned that the Government has given a lease of the
lows, showing the product and output of each year
from the organization of the Company.

RAYMOND & ELY.—On the 7th inst. 24 bars of bullion worth \$39,634 were shipped. On the 15th, \$35,906 was shipped; previous to last shipment \$69,603 had been sent down, making a total of \$105,509 up to the 16th inst.

CROWN POINT.—The ore breasts on the 1,300-ft level still look well and are in ore of good quality and character. The mine looks well at all points.

BUCKEYE.—On the 11th inst. \$1,467 were sent down, the proceeds of 110 tons of ore; on the 18th a bar valued at \$1,593 was shipped, the result from 110 tons of ore.

AMERICAN FLAG.—On the 13th inst. \$18,819 was sent down; previous shipments, \$9,869; total, \$28,678.

MAMMOTH.—The Superintendent expects soon to strike a large body of rich ore judging from indications.

CHOLLAR-POTOSI. — During week ending 15th inst. 577 tons of ore were extracted, and 612 tons sent to mill. Average assay of ore mined \$32.40.

HALE & NORCROSS.—During week ending on the 15th, 724 tons of ore was extracted, 755 tons sent to mill, and 1,474 tons remain on the dumps.

SAVAGE.—The report for week ending the 16th shows that 423 tons of ore were extracted, assaying \$25.38 per ton; 323 tons were sent to mill and 320 tons are at the mine.

IDA ELLMORE.—A har valued at \$3,455 was sent down on the 14th from 30 tons of ore,

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

PENNSYLVANIA.—*Alpine Chronicle*, Feb. 15.

This claim comprises 2,000 ft. Work was commenced on this mine in 1864; the upper tunnel is in 300 ft., and the lower is to the ledge—918 ft., from the latter a north drift of 70 ft., and a south drift of 150 ft. were made, the latter running on this ledge; in this tunnel is an air shaft, and 100 ft. from the mouth is a 30-ft. shaft; the distance from mouth of tunnel to cropping is 1,150 ft., and the perpendicular is 500; the ledge is from 3 to 8 ft. wide, running in granite, soft on the foot wall, with a gouge of fine clay; the other side is a hard and smooth granite wall. The ore assays from \$15 to \$500 per ton; \$43,000 have been expended upon this claim; it has been well managed, and the want of means to develop it caused the cessation of work. It is situated 2 miles southwest of Silver Mountain, and the lower tunnel is 1,500 ft. above the level of the town.

GEORGE WASHINGTON. — This claim has been sold to the Ogden Silver Mining Co. of Chicago. Work was commenced in 1862 and a 150 ft. tunnel driven on the ledge. In 1864 the lower tunnel was commenced and struck the ledge at a distance of 400 ft.; 270 ft. from the mouth of this tunnel a 50 shaft was sunk from

which a 150 ft. drift was made, and from this another drift was made towards the Frank ledge 70 ft.—half way to it. The upper tunnel is in the croppings and the lower is 100 ft. below this and 900 ft. above the level of the town of Silver Mountain. The ledge is from 1 to 3 ft. wide, the ore of which yielded, by Freiberg process, \$100 per ton; \$34,000 have been expended on this claim, but had management, and want of capital, caused suspension.

AMADOR COUNTY

HINKLEY.—*Amador Ledger*, Feb. 15: The lessees are industriously at work cleaning out the old shafts, and getting ready to take out rock. We hear that this mine is looking splendidly, and has every indication of paying rich.

BACON.—*Amador Dispatch*, Feb. 15: Work is being seriously interfered with on account of too much water in the shaft, and it is feared that operations will have to be suspended till spring, or until steam machinery can be put up.

CALAVERAS COUNTY.

LANCHA PLANA COAL DISCOVERY.—Calaveras *Chronicle*, Feb. 15: Messrs. Waddell and Murray, attracted by certain formations bearing a resemblance to coal, began prospecting, and as has been seen met with success. At the mouth of an old tunnel that had been run in former years, a black, clayey formation about 1 ft. in thickness, very soft, being easily cut with a shovel, was first discovered, which was traced the whole length of the tunnel, a distance of about 140 ft. Sinking a shaft at the end of the tunnel, at the depth of 4 or 5 ft., another seam was found somewhat thicker than the seam first discovered and of a harder nature. A little deeper and another seam was discovered, 2½ or 3 ft. in thickness, showing a good quality of coal. Still deeper 2 additional seams were revealed the last of which

has been penetrated but 2 or 3 ft. The lowest seams together are about 8 ft. in thickness. Thus at only a depth of 25 or 30 ft., 4 seams were discovered of considerable thickness, and each successive seam exhibiting a better quality of coal. This coal has been tested with the most satisfactory results. A great amount of land has been taken up, one company claiming over 700 acres.

RAILROAD FLAT DIST.—The new rich chimney in the 100 ft. south level of the Sanderson holds well as the level is being extended. The ore on this dump shows considerable free gold. The lower tunnel of the Herzer mine is developing one of the prettiest and largest fissures in the district.

WEST POINT DIST.—Two new chimneys have been discovered on an old mine near the Butcher ranch. This ore is from 1 to 3 ft. thick and will average near \$50 per ton. The Granite vein alluded to, week before last, is gigantic in proportions. A lot of unassorted ore taken from a space 12 ft. wide, across the vein, paid a fraction over \$9 per ton, no defining walls having been found. Masses of preulophurites, 2 and 3 ft. square, are found here and there in this vein, showing free gold.

HULL AND FISHER.—*Calaveras Citizen*, Feb. 15: This valuable claim, situated near the Sheep ranch, has indeed proven itself to be a model mine. The company have just completed sinking their shaft, which at present is down 130 ft.

Woods.—This claim, on the San Antonio Ridge, never gave better evidence of its richness than it does now.

SHEEP RANCH.—This fabulously rich quartz lead is still steadily yielding its precious ore. The mill at present is working on rock which

averages \$70 to the ton, and enough of the same sort in sight to last for years.

EL DORADO.

POCAHONTAS.—Placerville *Democrat*, Feb. 15: In this claim, at Logtown, a rich quartz development—good milling ore, 4 ft. in thickness—was struck on Thursday morning the 13th inst.

KERN COUNTY.

HOWE MILL.—Havilah *Miner*, Feb. 15: Another very healthy clean-up was made on last Saturday, \$700 being taken out of 30 tons of rock.

GOLD BRICKS.—Kernville minea forwarded to San Francisco last week gold bricks valued at some six or seven thousand dollars.

PROSPECTING.—As soon as the snow melts a prospecting party will start off to further explore the mountain fastnesses of Grizzly Bear Mountain. Additional gold-bearing ledges are supposed to be in the vicinity.

NAPA COUNTY.

OAKVILLE QUICKSILVER.—Napa *Reporter*, Feb. 18: This property has been purchased by the Napa Mining Co. of New York. We learn that the former Co. disbursed during the past 13 months something over \$80,000.

PACIFIC.—Napa *Register*, Feb. 18: We learn that splendid ore is now being taken from the main level. The rich vein lately found, is near the foot-wall of the lode ground, and seems to be dipping into the mountain. The ore resembles somewhat that taken from the lower incline, and has the appearance of being the most extensive and valuable of any yet found. There is being a drift run into it, which shows very fine for 30 ft., the distance already in, leaving heavy ore in the top and bottom, and both sides.

NEVADA COUNTY.

INDEPENDENT.—Grass Valley *Union*, Feb. 14: This mine is on a gravel range near the Town Talk; it has but lately started up, and its first run of ten days gives \$1,300 gross. There is a very large body of paying gravel within its bounds.

BARS OF GOLD.—Feb. 19: Yesterday, at Findlay's Bank, we saw 2 bricks of gold, from the Idaho, which were turned out of the mill after a run of six days. The bricks are valued at \$19,000, and the gold thereof was cleaned up from the amalgamators alone. The batteries were not touched in the clean-up. Battery cleanings and sulphurets will add much to the value.

A 12-days' run of the Eureka amalgamators cleaned up, gives stamp to the value of \$23,000. Only 10 stamps were run to produce this result.

PLACER COUNTY.

QUINN'S MILL.—Placer *Herald*, Feb. 15: About 2 years ago Stephen Quinn purchased the old water power quartz mill and ledge at the falls of lower Bear river ditch, near Gold Hill, and repaired the mill and opened the ledge. Since the water came this fall the mill has been kept to work and has paid up for the mill and mine, and the ledge is now paying from \$22 to \$28 per ton regularly.

SAN DIEGO COUNTY.

GOLDEN CHARIOT.—San Diego *Union*, Feb. 9: Richer rock is now being taken out of this mine than ever before, and the ledge is from 5 to 6 ft. in width. There are over 400 tons of rock lying on the dump which will yield an average of \$100 per ton. Arrangements are now being made by the company to crush its own rock.

OWENS.—The hoisting works have been put up. Several hundred tons of rock have been stored in the mine, awaiting hoisting.

KENTUCK.—Whitney's mill is at present engaged in crushing about 30 tons of ore from the mine, all of which will yield from \$100 to \$150 per ton.

HELVETIA.—The shaft is down 240 ft. The ledge at that depth is about 3 ft. in width, and contains ore yielding from \$25 to \$30 per ton.

TUOLUMNE COUNTY.

KINCAID FLAT.—Sonoma *Democrat*, Feb. 1: Washing in this claim commenced about a week ago. Everything works to a charm, and what is very pleasant to the stockholders is the occasional sight of a piece of gold, that animates the eyes of those fond of dividends and filthy lucre.

Nevada.

ELY DISTRICT.

ALPS.—Pioche *Record*, Feb. 9: Ores still being botled in undiminished quantities; one load of which is being hauled to the mill each day.

CUTTER OF THE HILL.—Now down with the main shaft 120 feet below the level of the Burk tunnel. The shipment of ore last month amounted to 120 tons, the greater portion of which was high grade ore. The bulion shipment of the Chief of the Hill, for the month of January, was \$9,063, of which nearly \$300 was gold.

CHIEF EAST EX.—Shaft below the 90-ft. level down 105 ft. Ledge about 2 ft.

CHIEFMAN.—Work was resumed on this mine on the first of the month. It is now confined to prospecting the 360-ft. and 424-ft. levels.

DEXTER.—This is the name given a new lode discovered during the week near the Excelsior. A breadth of ore is now shown between 3 1/2 and 4 ft., which assays from \$210 to \$400 to the ton. It was struck 63 ft. below the surface.

EXCELSIOR.—The main shaft is now 225 ft. deep. The winze to connect with the shaft is now 103 ft. deep. About 7 tons of first and 3 of second class ore are being hoisted daily. The ore is constantly increasing in richness and now yields \$150 to the ton.

HORN AND HUNT.—Ore has continued to be taken from the mine of this company at the rate of from 15 to 25 tons a day. In the back ledge, in the extreme east drift, the vein has widened to fully 5 ft., on the tunnel, and there the ore is fully as rich as in any other part of the ledge—that drift being 50 ft. further east than any other. In the extreme west drift the ledge is about 3 ft. wide, and the ore there is high grade.

MADON VALLEY.—But little ore has been hauled to the mills for some days, but the usual quantity has been brought to the surface.

PIONEER.—The usual quantity of ore is being taken out,

and it is of a richer character than that raised last month. The haulage yield of last month has been considerable above the average, and there is a large amount of high grade ore on hand.

PIONEER PHOENIX.—New shaft progressing finely. Now down 300 ft. Ground very favorable for sinking.

RAYMOND AND ELY.—Tremendous quantity of ore out, the dumps being full. But little hauling was done during the week, owing to the epizootic and impassable condition of the roads. Oxen have been engaged, and it is thought the usual amount of ore will be laid down at the mills.

SILVER PEAK.—Larger quantities of ore than usual have been brought to the surface during the week, and 90 per cent. of it is high grade ore. There are now over 50 tons on the dump, which the assayer's certificates show to be worth, on a fair average, \$150 a ton. The ore breast is the same as before reported—about ten inches wide.

SPRING MOUNTAIN TUNNEL.—The tunnel is now in 300 ft. Three veins have been cut, all of which are promising in appearance, and from present indications, a fourth will be reached in a few days. A shaft has been started outside and below the dump to cut the first or No. 1 ledge at a depth of 600 ft. on its dip. Its great breadth and richness, as proved by assays, make this one of the finest ledges prospectively, in the district.

THE STAR OF THE UNION.—This is a promising lode about half way between Pioche and Highland. An assay run just under the vein, and is now about 170 ft. down. The ore is a fine milling rock, assays running so far, from \$60 to \$172 to the ton, with good bodies presented.

SEMI-BITUMINOUS COAL.—Feb. 13: We have been shown, and witnessed the burning of, some excellent semi-bituminous coal, from the mines of the Wahsatch Co. about 30 miles east of here in Utah. It burns with clear, bright flame, leaving behind white ashes, free of "clinker." The deposit now being worked is 12 ft. in thickness. Preparations are now being made to deliver it in Pioche in large quantities, as soon as the roads become passable.

MAONETIC AND HEMATITE IRON ORES.—Specimens of these ores may be seen at the office of Mr. J. B. Deane, Main Valley street. The hematite assays \$24 in silver. Both are of the purest quality. They are from the iron mines in Iron Mountain district, 75 or 80 miles east of here, and on line with the Bullionville narrow-gauge railroad.

EUREKA DISTRICT.

PAUL JONES, COY HILL.—Eureka *Sentinel*, Feb. 16: An assay made of ore from this mine, a day or two since, gave the astounding result of \$4,200 in silver to the ton. The ore is all millable, containing a very trifling percentage of lead.

HUMBOLDT.

CENTRAL PACIFIC.—Silver *State*, Feb. 15: We learn that the mine is looking first-rate, and that there is now in sight, in the levels and stopes, an unlimited quantity of excellent milling ore.

SANTA CLARA.—A sample of ore from this mine, in Santa Clara district, assayed by David Van Luencup, this week, yielded \$3,350 per ton. The sample of ore assayed was taken from the ledge at a depth of 15 ft. from the surface.

RAILROAD DISTRICT.

COR. ELKO INDEPENDENT.—Feb. 15: The Empire City Mining Co. started up its furnace on the 4th inst., and is doing good work, smelting about 14 tons of ore per day and turning out 3 tons of bullion, assaying \$220 in silver.

The mines now worked are the Last Chance and Lone, belonging to the E. C. M. Co. The Woodcock Company is running a tunnel to its mine. The Tripoli is doing the same. A tunnel is being run to cut the Bob Hunter, which is a large deposit of vein matter, containing considerable copper ore, consisting of silicate, carbonate and black oxide. The tunnel now being run will strike the lode over 100 ft. deep, and will give a thorough prospect of the lode at the bottom. The Last Chance district is now being worked on the 200-ft. level. The ore coming therefrom is a galena of very high grade, assaying from \$50 to \$400 per ton. At this point the stope now being worked is 6 ft. wide. A shaft is now being sunk upon the lode in Hussey tunnel, and is now 40 ft. below the tunnel on what is called a pipe of ore. This ore is first-class; the body, however, is small, but the prospects are reaching a body below are good. The Elia and State of Maine tunnel and all the rest of the mines are lying idle for the winter.

RESE RIVER.

MONTZUMA MILL.—Reese River *Review*, Feb. 10: This 10-stamp mill, it is reported, will be started up some time next month by Messrs. E. P. Figg & Co., of Sacramento, who are now taking out fine ore from their own mines in the Montzuma (Woodland) mining district. The prospects in that long-neglected district are said to be very promising.

WHITE PINE.

RENEWED ACTIVITY.—White Pine *News*, Feb. 15: We are gratified to learn from most reliable sources that the mining interest on Treasure Hill are commencing to show renewed life. The Aurora and Eberhardt companies are constantly adding to their force of men; the tramway of the company is constantly at work, and the mill in operation. Beside this company other valuable properties are being put in shape to work. The merchants are doing better than for weeks past, and money is more plentiful. It is not an exaggeration to say that the mines, especially the Ward Beecher, are daily improving in appearance. There is a feeling of confidence in our future, in which we share, and when travel opens the old days of '70 will be again witnessed.

RICH ROCK.—We have been shown some rich rock from Cherry Creek district, situated about 60 miles from here. By the samples we are of opinion, that, if there is enough of it, we would gladly sell out our interest and invest at once. Our informant says there are some 20 men now in that section, who are prevented from work on account of heavy snows, etc.

WASHOE.

ALAMO.—Gold Hill *News*, Feb. 15: The erection of the new building over the main shaft is making good progress, also sinking of the shaft. The main north tunnel is still driving ahead, the rock in the face working well.

ARIZONA AND UTAH.—The main shaft is down 197 ft. The bottom being in soft working rock, with streaks of quartz and chert.

BEAUCHE.—Daily yield 400 tons. The 1,200-ft. level is turning out better and better. The drift to open the 1,400-ft. level is being driven ahead as fast as possible. The other ore levels of the mine are yielding finely as usual and the various drifts being pushed ahead in the most efficient manner. The main incline is down 69 ft. below the 1,200-ft. level.

BRECKENRIDGE.—North of the incline a fine body of ore is developed above the 4th station, 3 or 4 ft. in width, and assaying \$24 per ton on the average. Total bullion shipments for Jan., \$4,092.8.

CALEBONIA.—Work driving ahead as usual. The main south drift at the 400-ft. level is in 14 ft. with the face showing quartz and porphyry. We saw some very good ore taken from this mine 2 or 3 days ago, a piece of which assayed at the rate of \$114 to the ton.

CHOLLAN POROSI.—Daily yield 90 tons of ore, the assay value of which is \$42 per ton. The several prospecting drifts on the 750 and 950-ft. levels are still pushed with all the vigor possible.

CHOLLAN POROSI.—Could about 500 tons in the 1,100, 1,200 and 1,300-ft. levels. The last mentioned level continues to open out better and richer as further developed. The ore is being hauled out to the height of three floors and increases in richness and extent up to the Belcher line. A drift north is now being run to ascertain its extent in that direction. The 1,400-ft. station has been opened and a drift run south toward the ore body is being energetically prosecuted. The main incline is now down about 40 ft. below the 1,400-ft. station.

GOULD & CURRY.—Sinking the incline is making excellent progress, the rock in the bottom working well. The main east drift on the 1,500-ft. level is making slow yet steady progress, the flow of water from the face continuing quite strong, necessitating great caution in the advance of the work.

HATE AND NONCHANCE.—The ore breasts between the 5th and 9th stations are holding out and yielding finely, while those between the 9th and 10 stations continue to improve in both looks and quality. The main north drift at the 12th station (1,700-ft. level) to connect with the north winze from the level above and the north winze from the 1,500-ft. level to connect with the north drift of the 1,700 are making good headway.

JEWELL.—This mine is looking well, and improving. The south drift at the 400-ft. level is in fine looking quartz.

JULIA.—The face of the main east drift at the 800-ft. level is in a mixture of clay and quartz. The west drift at the 1,000-ft. level is in 39 ft.

KENTUCK.—Daily yield about forty tons, from the old levels, which are showing some improvement. Work is resumed in the cross-cut east at the 1,300 ft. level, which is now in 114 ft.

SAVAGE.—Sinking the incline is making good headway. The main north drift on the 1600-ft level to connect with the south drift on the same level from the Gould & Curry shaft is making good headway. The main south drift on the 1600-ft. level is still driven steadily ahead to connect with the winze from the level above.

VERMONT NEVADA.—Daily yield, 60 tons of good milling ore. Much trouble has been experienced during the week in obtaining a sufficient supply of wood to keep the mill running.

SILVER CLOUD.—The face of the stopes on the upper level and the stopes in the back as well as the old workings continue to yield a large quantity of high grade ore that assays very high in gold, the winze from this level is down 15 ft. in metal-bearing quartz. At the first station the face of the drift continues in ore that assays an average of \$95.41 per ton. In this, as in the upper part, on the percentage of gold over silver is about 5 to 1. Mining experts have examined this claim and made careful estimate of the ore in sight, which they compute at 2,500 to 3,000 tons.

SILVER HILL.—Main north drift in 453 ft. South drift in 424 ft. Sinking the shaft is resumed.

STUBB TUNNEL.—Total length 3,601 ft. The diamond drill is being used in shaft No. 1 with good effect.

SUCCESS.—Some excellent ore is being extracted from the main drift on the ledge in the new shaft, in the canon east of the mill.

VIRGINIA CON.—The rock in the bottom of the shaft continues to work finely and the sinking is making excellent progress. The main north drift from the Gould & Curry shaft on the 1167-ft. level, is still continued. Another hoisting engine and two additional reels have been ordered.

WOOLWILE.—At the 3d station the north drift is in 25 ft., carrying very fine ore across the entire face. The south drift is in 35 ft. the ore assaying very high in gold. At the 2d station the pay body is 3 ft. wide, and assays \$76.37 to the ton.

CONFIDENCE.—Virginia *Chronicle*, Feb. 15: In the drift which is being run from the 1300-ft. level of the Yellow Jacket to connect with the 1600-ft. level of the Imperial, it is generally believed that a body of ore has been struck that assays from \$28 to \$56 per ton. A connection between the drift running north through this mine from the 1300-ft. level of the jacket, and the drift running south on the 1600-ft. level of the Imperial, will soon be made.

ORFEL.—The drift which is being run east on the 1465-ft. level of this mine is in about 270 ft. from the new shaft and has been run through quartz for the last 70 or 80 ft. in which streaks of ore have been found that assay \$35 to \$40 per ton. Judging from appearances, the ore found here is that of a chimney.

OVERMAN.—The drift on the 1000-ft. level of this mine is being pushed ahead, 25 ft. having been made during the week. The general opinion of interested parties is that the ledge will be struck before the drifts run many ft. further.

YELLOW JACKET.—No ore taken from this mine at present. Prospecting is being carried on to the 1300-ft. level. They have lately commenced to open the 1400-ft. level. Repairs on the shaft not yet finished.

Idaho.

EMPEROR.—Owyhee *Avantache*, Feb. 8: We are creditably informed that an immense body of rich ore has just been struck in the north works, extending through the 1st, 2d and third levels. This good news has already given our miners and business men renewed confidence in our camp.

Montana.

CERRY CREEK MINES.

ENSELMAN.—Montanan, Feb. 6: The shaft is down 50 ft. and has about 25 tons of first-class ore on the dump. The crevice at this depth is fully 2 ft. and the ore materially increasing in silver. From 78 pounds of (we presume selected) rock worked in a band mortar, Mr. Enselman recently obtained 23 ounces of bullion assaying \$3 per ounce. A ton of such rock would yield in the same mode of \$15,000. We have received three specimens which are almost entirely coated with native leaf silver, which are indeed magnificent.

EDENHART.—They are now down to the depth of 83 ft. with a 2 ft. crevice, and have about 50 tons of first-class ore out.

Among the shipments of ore to Silver Star for reduction by the new process, were 500 pounds of top rock cullings. The product was 17 ounces of bullion worth \$3 per ounce. This, for third-rate ore, may be considered good. They now have about 2 tons of first-grade ore from the same lead which will not yield less than \$8.00 per ton.

HOMER.—They are beyond the 50 ft., with the vein maintaining a good 2 ft. in width and the quality of ore improving.

Utah.

HORN SILVER DISTRICT.—Cor. Salt Lake *Tribune*, Feb. 10: A recent discovery of rich copper mines is all the talk in this place. On the 14th ult., several parties formed a prospecting expedition and returned a few days ago with some very rich copper ore, and report large and numerous lodes. Assays range from 15 to 42 per cent. in copper, and as high as \$40 silver, which is well worth looking after in these "latter days." A second party will leave here in a few days to organize the district and commence developing the mines.

LITTLE COTTONWOOD.—Feb. 14: Although the snow is lying 12 ft. deep in the Little Cottonwood canon, work is being vigorously prosecuted and many of the principle mines in the Haverth, Last Chance, Montzuma and Savage, worked by the Utah Winsor Mining Co., the development is going steadily on and with increased promises of a splendid future. In the Savage a 4 ft vein of rich ore is found; which will readily yield 10 tons or more a day—one that smelts with the greatest ease. The veins in the Montzuma, Haverth and Last Chance though not quite so large produce very high grade ore, and there is little doubt but these mines will turn out the coming season at least 25 tons per day of ore carrying on an average of over 200 ounces of silver per ton, besides a fair percentage of lead. The ore will probably be smelted at the Saturn.

The Illinois tunnel is looking well and indications are not wanting to show that the great vein of the tunnel will soon reach the great mineral belt underlying the divide.

The Utah tunnel is said to have reached ore. **WEST MOUNTAIN DISTRICT.**—Cor. Salt Lake *Tribune*, Feb. 14: I am quite impressed with the promising appearance of many of the mines and things in general, particularly with the promises of both the Utah Silver Mining and the Winsor & Co. The Utah has 2 furnaces which are principally supplied with ores from the Portland and Red Warrior.

This latter lode contains a large deposit of galena ore, surpassed in quantity only by the Comstock, and but for the low grade of the ore in silver, it would be the most valuable mine in the district.

The Winsomac Company, organized in New Haven, have two furnaces. The Winsomac has, during the past year, netted its owners about \$500,000 in bullion, and has recently been sold for a good price to a German Co.

Trade-Marks.

"Any person or firm domiciled in the United States, and any corporation created by the authority of the United States, or of any State or Territory thereof, and any person, firm, or corporation resident of or located in any foreign country, which, by treaty or convention, affords similar privileges to citizens of the United States, and who are entitled to the exclusive use of any lawful trade mark, or who intend to adopt and use any trade mark for exclusive use within the United States, may obtain protection for such lawful trade-mark."

The foregoing is an exact copy from the Patent Laws of 1870. In accordance with the Patent Office rules established by authority of the law, a trade-mark may be patented for thirty years, and renewed for a term of thirty years.

A legal trade-mark, properly registered, becomes personal property that can be sold and assigned. The law says: "Any person or corporation who shall reproduce, counterfeit, copy or imitate any such recorded trade-mark, and affix the same to goods of substantially the same descriptive character, and the quality as those referred to in the registration, shall be liable to an action on the case for damages for such wrongful use of said trade-mark, at the suit of the owner thereof, in any court of competent jurisdiction in the United States, and the party aggrieved shall have his remedy according to the course of equity to enjoin the wrongful use of his trade-mark, and to recover compensation therefor."

The *American Newspaper Reporter* makes the following sensible remarks:

"Every person, or firm, doing business, no matter of what kind or nature, so long as it is honorable, should have a trade-mark. It serves as an advertisement, and the first mere nominal cost is a trifle. Yet in a year's business the same amount of circular advertising would cost hundreds of dollars. The trade-mark can be used in connection, which cannot be limited, as the law protects it. Americans, who excel in the manufacture of certain classes of goods, and place their goods in European markets, soon discover that they are not only in competition with the best makers of the same line of goods, but find that their trade-mark protects them from imitation and counterfeit. The trade-mark is called a shield of things. There are many people engaged in the same business, yet it would not be at all difficult to have an especial originality in their designs. Let manufacturers put a trade-mark upon all their productions, and let dealers do the same to all the wares they send out. It is a protection to the former, and of vast business benefit to the latter."

Designs for trade-marks are taken out by Dewey & Co. of this city, for \$45, including Government fees.

OHIO CONS. G. M. Co.—This Company whose works are located at West Point Calaveras Co., Cal. have just completed one of the largest and finest overshot wheels in the country for the purpose of pumping, sinking and running the hoisting works. The main working shaft is down to a depth of 97 feet, where the ledge has been struck—when the water came so rapidly as to compel the erection of the hoisting works which has the capacity of going down 500 feet deeper than the shaft now is, as also of attaching and running five stamps in connection therewith.

This entire district of West Point is improving rapidly. The mines now being worked producing ore \$25 to \$100 per ton by mill working process. We are told that the future prospects of the Ohio are very promising, and that under the management of its present able superintendent we will soon have further favorable reports.

THE PHOENIX MINE CREDITORS.—At a meeting of the creditors of the Phoenix Silver Mining Company held at Eureka, Nev., on the 13th inst., J. M. Robertson, Agent of the Board of Trustees, proposed to pay one-third of all demands immediately in cash, one-third in ninety days and the remainder in six months from the date of signing the agreement with the creditors. The Company is giving good notes for the amount due, with interest of one per cent. per month. Mr. Goldstone moved that Mr. Robertson be requested to ask the trustees if they will place the property of the company in the hands of a committee in trust for the creditors to secure payment of the notes free of all incumbrance. The motion was adopted and the meeting adjourned. The whole amount of indebtedness is about \$52,000. An adjourned meeting was held on the 18th, and the creditors concluded to accept the terms first offered by the agents of the Board, viz: One-third cash, one-third in ninety days and the remainder in six months, taking the company's note as evidence of remaining indebtedness.

RICH STRIKES NEAR WHITE PINE.—In our neighboring district of Robinson, strikes of rich ore have been made frequently the past few weeks. Quite an excitement exists in the camp six miles southeast of Mineral City. It is believed by those well posted on country formation and ores, that there will be a big rush there in the spring months, as every indication shows that permanent ledges of rich mineral exist in that locality, requiring only a small outlay of capital for development. The town of Mineral City itself shows lively signs of improvement, building going on rapidly, and substantial improvements of every kind now in course of construction. As this District has come up entirely on its merits, we predict it to be one of the most prosperous places in our country during the coming season. —*White Pine News*.

Resources of Utah—Some of the Principal Mines.

We continue these articles from the Salt Lake Tribune. The Emma mine is situated in Little Cottonwood Cañon formerly a portion of the "Mountain Lake" Mining District. It was the first fully developed mine in the Territory. The results obtained in its development gave the impetus to mining generally. This mine stands at the head of the list for quantity of ore taken out and work done upon it. The first great discovery was made in 1869 when the prospectors at the depth of 127 feet struck a lode of mineral of vast extent, which afterward yielded a profit of \$120 per ton on shipments of the ore to Swansea in Wales. In the winter of 1869-70 a half interest in this mine was offered and could have been purchased from the discoverers for less than \$3,000. In the month of May, 1870, the firm of Walker Brothers, of Salt Lake City, purchased a one-sixth interest for \$30,000. In the summer of 1871 a half interest in the mine was sold to New York capitalists for \$750,000. In the winter of 1871-2 the Emma Silver Mining Company of Utah, was incorporated, stocked and placed upon the London market at £1,000,000 sterling. Fifty thousand shares of £20 each were issued, twenty-five thousand of them were immediately taken up, and the remaining twenty-five thousand were retained by the vendors of the mine.

The Direction and management is represented as follows:

Chairman, George Anderson, Esq., M. P.
Vice-Chairman, E. D. Williams, Esq., M. P.
Resident General Manager, Warren Hussey, Esq.
Superintendent, Silas Williams, Esq.
Secretary in London, W. H. Tooke, Esq.

The quantity of ore taken out of the mine during the year 1872, was 10,500 tons and the average value was about \$100 per ton, making a total value of \$1,050,000. The proportion of silver was 100 ounces to the ton of ore and 45 per cent. of lead. The average daily quantity of ore when working is about sixty tons, but 100 tons can be got out when the mine is worked to full capacity. Connected with the mine is a steam hoisting engine, the capacity of which is 150 tons per day.

Dividends have been declared and paid monthly at the rate of one and one-half per cent. on the capital stock.

In the spring of 1872 the mine was flooded with water—an experience quite new in the history of the mine, and which caught the company unprepared for such a disaster. Two large "Kuowes" steam pumps have been since erected and they are of sufficient capacity to keep the mine dry, should such another casualty occur.

Some considerable new developments have been made during the past year. Shafts have been sunk below the previous lowest workings, which have developed a large vein of ore, very rich in silver, a specimen of which weighing 100 pounds, averaged by assay 1123-87-100 ounces in silver to the ton.

The arrangements for working this winter are very complete. The out buildings are of a very substantial character. A new and commodious ore-house has been constructed, also a tramway for conveying waste matter from the mine. The new timbering in the mine is a first-class piece of workmanship and exceedingly strong.

THE FLAGSTAFF MINE,

Of Little Cottonwood Cañon, is owned by an English company, and was incorporated in London in November, 1871, with a capital of £300,000. The property includes the Flagstaff Mine, Maxwell Tunnel and extensive furnaces.

The mine at the time Mr. Maxwell reported on it for the directors, had in reserve 6,000 tons of ore blocked out by shafts, adits and winzes. The work of development has been steadily increasing, and at the present time shows the reserve of ore to be 26,000 tons, which result has been arrived at after a careful examination by Mr. Maxwell and Capt. Goldsworthy, the foreman at the mine.

During the year 1872 the mine yielded about 10,000 tons of ore.
